'All sciences,' Comte wrote, 'aim at prevision. For the laws established by the observation of phenomena are generally employed to foretell their succession.' This is as true of sociology as it is of chemistry and physics. All sciences use verified conjectures to predict, explain and thus control phenomena ([6.13], 167). However, in the case of sociology Comte qualifies this view in two respects. The first is that the content of such laws, in sociology as in the other sciences, is to be restricted to the succession and co-existence of observable phenomena, whether direct or indirect—to telling us, in the form of an accurate description, how an event or process takes place, but not why it does. We cannot explain why a particular sequence occurs even though we can describe how it takes place. This distinction between the explanatory 'why?' and the descriptive 'how?' is found in the work of a long line of eighteenth-century philosophers, including Berkeley, Hume, Thomas Reid, Dugald Stewart, Thomas Brown, and also in that of the Sicilian physicist Ruggiero Boscovich. At the end of the nineteenth century the distinction featured prominently in the writings of Ernst Mach, the Austrian physicist who was an early advocate of logical positivism. In this group, Comte was forthright in claiming that laws of phenomena give us genuine explanations because all that we can sensibly want to know is how, and not why, something happened.

The other qualification that Comte applies to the laws of sociology is that they must concern large-scale collective events and processes, for it is the general features of an entire society or form of government or economic system, and the types to which they belong, that are the operative factors in the historical growth of human faculties and achievements. 'It is clear,' he says, 'that the social evolution must be more inevitably subject to natural laws, the more compound are the phenomena, and the less perceptible therefore the irregularities which arise from individual instances.' A closely related point is 'that the laws of social dynamics are most recognizable when they relate to the largest societies, in which secondary disturbances have the smallest effect'. As a civilization develops, 'the social movement becomes more distinct and certain with every conquest

over accidental influences'. The result, according to Comte, is that 'these fundamental laws become the more irresistible, and therefore the more appreciable, in proportion to the advancement of the civilization upon which they operate' ([6.11], 2:

In describing this qualification, one of central importance in his system, Comte is led astray, as he often is, by not distinguishing more clearly between a general law and the effects of its operation in any given instance. Thus what is more recognizable, if it is, than the effect produced by a social law operating in a small society is the effect of the law's operation in a large society. Again, it is not the fundamental laws themselves that become more 'irresistible' but their effects in the fields in which they operate. That is, the nature, or content, of the laws does not change; it is the changes in the fields in which they operate that make the laws more recognizable and 'irresistible'. For Comte, the significance for scientific procedure of the distinction between large-scale collective events and 'secondary disturbances' is considerable. 'Astronomers,' he writes,' in commencing their study of the laws of the planetary movements omitted all consideration of the perturbations. After these laws had been discovered, the modifications could be determined' and brought within the scope of the law that applied to the chief movements. But if we had begun by trying 'to account for the irregularities, it is plain that no precise theory could ever have been constructed'.

Comte's conclusion, then, is that, in order to examine the secondary disturbances that affect the rate of social change but do not fundamentally alter it, sociologists must first find the general laws that chiefly control social progress. The counter-influences exerted by secondary factors can then be reduced to the fundamental laws. But how, in Comte's view, do we discover at the beginning which is the 'principal movement' and which the secondary, or accidental, influences? What makes a sociological conjecture a plausible one? To this query Comte offers no response, believing, as he did, that the question has no informative answer other than what he has already said about scientific, and thus sociological, procedure in general: a plausible conjecture is one that not only meets the procedural criteria but takes account of the current state of knowledge within the field. We can only say what makes a particular hypothesis plausible, not what makes hypotheses in general plausible. True, we can exclude certain types. That does not, however, give us a useful characterization of the remainder.

Comte's emphasis on the importance of mass phenomena in sociology largely contributed to a major difficulty in his account of the structure of sociological laws. The difficulty arises from his assumption that, for the most part, sociological laws of the future will be direct generalizations from various sorts of aggregates and collective events. It is to assume, for example, that because the Great Depression of the 1930s was a collective event, each singular causal statement about its causes must imply a generalization about the economic and social causes of depressions in general. Yet this is obviously not true. The fact that our palm tree has been torn up by the roots in a hurricane does not imply that there must be a physical law to the effect that all similar trees are torn up in similar hurricanes. What we are committed to by our singular causal statement is simply this: there are generalizations from which, given appropriate statements of initial conditions, our singular statement is derivable, for these generalizations are physical laws that we can use to explain the effects of certain physical forces, such as hurricanes of a given intensity, on specific types of objects under specifiable conditions. Such laws can

be applied to many kinds of situations, and that of our palm tree is merely one of them. Comte thought that the future laws of sociology would be direct generalizations about forms of government, armed forces, rebellions, nations and all other collectivities whose operations could in some sense be observed directly, or indirectly. Yet it has often been remarked that the operations and composition of such aggregates are the joint outcome of highly varied influences and causes. Hence, if there are any sociological laws to be found concerning these collectivities, whether observable or not, the laws must be quite general and abstract.

THE SOCIAL REFORMER

On the first page of the preface to his second multi-volume work, the *Système de politique positive* (1851–4), Comte says that his philosophical career has been 'homogeneous throughout; the end being clearly aimed at from the first'. He is referring here to his lifelong project to reform the intellectual, social and economic life of European society, and to his intention from the beginning of his career, as his earliest writings show, to develop a social science that would both explain the unhappy state of that society and prescribe the appropriate remedies to eliminate its anarchic condition. Many of the early readers of the *Cours,* such as Mill, Littré and Whewell, were unprepared for the kinds of social prescriptions that Comte issued more and more freely and at ever greater length in his succeeding publications. Comte's history of science and his discussion of its methodology had won their professional admiration; and his claims of the benefits that applied science could bestow on a rejuvenated society, one that embraced the positivist 7Religion of Humanity, had stirred their religious yearnings for individual fulfilment through the pursuit of a worthy common goal, that of a rejuvenated and unified society. In his 'Introductory Remarks' to the first volume of the *Système* or *System of Positive Polity* Comte makes his project of social regeneration quite explicit:

> it becomes every day more evident how hopeless is the task of reconstructing political institutions without the previous remodelling of opinion and of life. To form then a satisfactory synthesis of all human conceptions is the most evident of our social wants: and it is needed equally for the sake of Order and of Progress. During the gradual accomplishment of this great philosophical work, a new moral power will arise spontaneously throughout the West, which, as its influence increases, will lay down a definite basis for the re-organisation of society. It will offer a general system of education for the adoption of all civilised nations, and by this means will supply in every department of public and private life fixed principles of judgment and conduct. Thus the intellectual movement and the social crisis will be brought continually into close connection with each other. Both will combine to prepare the advanced portion of humanity for the acceptance of a true spiritual power. ([6.6], 1:2)

In the fourth and final volume of the *Système* Comte outlines the nature of social reconstruction and true spiritual power, having used the other three volumes to qualify

and amplify the argument of the *Cours*. It is in this last volume that Comte advances his belief that the cultivation and use of the benevolent emotions produces the fullest happiness; that the only moral actions are those performed entirely for the good of other people, and that self-gratifying actions are morally worthless and to be eliminated; that all scientific enquiry is to be pursued and valued only in so far as it fulfils human needs and desires of a practical kind, for disinterested investigation, especially of abstract topics, is morally unwholesome for most people; that useless plants and animals should be destroyed along with the major portion of existing printed material; that the practice of art is the most suitable occupation for human beings since it stimulates their worthwhile emotions; and that these views can best be realized by the concerted action of the working classes and the intellectuals, the latter of whom will later form a priesthood that will lead and maintain the public worship of the Religion of Humanity—that is, the worship of the great and valued dead for their past contributions to human happiness. This priesthood will also be in charge of the educational system that will support the detailed arrangements which Comte laid down for the social and economic tasks to which the various classes of citizens will be assigned according to their ability and qualifications. In brief, the reorganized society will have a theoretical class and a practical class: the former will provide the principles and system of general ideas needed for the guidance of the society; the latter will carry out the administrative and practical measures, such as the distribution of authority and the arrangement of institutions that are needed to fulfil the general plan.

In the early essay, ‘Plan for Reorganizing Society’, Comte remarked on the long span of time that a scientific or social revolution displayed between the announcement of its basic principles and their embodiment in practice. It required a century, he says, for the conception of the elastic force of steam to find a use in machinery, and five centuries for the ‘triumph of Christian doctrines’ to develop into the Catholic-feudal system of western Europe—the system upon which his own proposed two classes are modelled. Hence, the rate of social change depends both on the adoption of clear, well understood policies or principles and on the amount of effort put into carrying them out over a long period. This shows us ‘the absurdity of attempting to improvise a complete plan for reorganizing society down to its smallest details’ ([6.13], 122). Yet this absurdity is what Comte embraces late in the *Système*. There he proposes that school ‘instruction will occupy seven years, during which each pupil remains throughout under the same teacher, teaching, be it added, both sexes, though in separate classes’. Every school will need seven priests and three vicars. Each professor will give two lectures a week for ten months, in addition to a month of examinations. ‘Every school is annexed to the temple of the district, as is the presbytery, the residences of the ten members of the sacerdotal college and of their families’. The upshot of these arrangements is ‘that the spiritual wants of the West may be duly met by a corporation of twenty thousand philosophers, of whom France would have the fourth’ ([6.6], 4:223). It is true that Comte warns us that these numerals will be corrected when better data become available. However, many of the other details will remain, and throughout the volume Comte provides a very large number of fixed and highly specific recommendations.

The philosophical interest of these Utopian schemes is slight, but their presence clearly reveals that the dominant impulse in Comte’s thought is social reform. For him,

philosophical discussions are just a necessary stage in that regenerative process. For that reason, they often form part of his grand system without themselves being systematic or thorough, and often without being advanced or defended by argument. If the distinctive feature of philosophy is, in John Passmore's phrase, 'its being a critical discussion *of* critical discussion', then Comte is a philosopher only on rare occasions. Moreover, he often proceeds to his conclusions without either first- or second-order critical discussion. For instance, in his treatment of astronomy in the *Cours* he begins by asserting that 'astronomical phenomena are the most general, simple, and abstract of all' and that the study of science must begin with them ([6.11], 1:28). However, this claim depends upon the truth of Comte's later and additional belief that in the case of the planets 'we may determine their forms, their distances, their bulk, and their motions, but we can never know anything of their chemical or mineralogical structure; and much less of organized beings living on their surface'. Not only can we 'never learn their internal constitution', and the amount of heat absorbed by their atmospheres, but their mean temperatures are 'for ever excluded from our recognition'. The laws of astronomy must therefore be the laws solely of the geometrical and mechanical features of the heavenly bodies ([6.11], 1:148–9) It is this limitation achieved by tendentious definition that makes astronomical phenomena most general, or simple, and abstract; for knowledge, such as we now have, of the chemical and physical structure of astronomical bodies would convert portions of astronomy into 'celestial' physics and chemistry, thus destroying, for Comte, its generality and abstractness.

Again, in his discussion of intellectual progress Comte says of truth,

> our doctrines never represent the outer world with exact fidelity. Nor is it needful that they should. Truth, in any given case, social or individual, means the degree of exactness in representation possible at the time. For positive logic is but the construction of the simplest hypothesis that will explain the whole of the ascertained facts.
>
> Any superfluous complication, besides causing a waste of labour, would be a downright error, even though a fuller acquaintance of facts might at a later time justify it. In fact, without this rule subjectivity runs wild, and the mind tends toward madness… But in proportion as our observations are extended, we are forced to adopt more complicated theories in order adequately to represent facts. ([6.6], 3:19)

There are two points of immediate interest here. The first is that the notion of 'exactness in representation' is ill prepared to stand unsupported as it does. For Comte, representation or enunciation of facts—whether the facts are statements of observation or statements of a lawlike kind—can have meaning, and thus be scientific, only if they are testable. The construction of simple explanatory hypotheses is an essential part of the process of confirmation that establishes the claim of factual statements to have meaning. But what makes a testable representation, of varying degrees of exactness, a true one rather than merely a meaningful one? On this point Comte is unhelpful. On the second point he is little better. Permitting undue complication of hypotheses has often been criticized for leading us away from the truth, but seldom for allowing, or perhaps

encouraging, the wilder flights of imagination. It is true that unduly complicated hypotheses are sometimes the expression of unchecked imagination although, as Comte himself points out, complex hypotheses are often required. However, what injunctions of simplicity, such as Occam's Razor, are designed to do is to smooth the path to adequate hypotheses, not to constrain imaginative and complex conjectures. Whether they are unnecessarily complex is often impossible to determine until simpler testable ones become available, and even then the nature of the criterion of simplicity may itself be open to debate.

Against such defects in Comte's architectonic method must be set his achievements, near-achievements and fertile errors. His outline of sociology as a new science of social systems, one using empirical data and testable laws to study collective behaviour, combines all three of these characteristics. Before Comte, many writers had advocated the creation of a natural science of politics, but it was Comte who produced a detailed description of its future structure, subject-matter, the scientific procedures appropriate to its topics and the relationship of sociology both to the other sciences in the hierarchy of scientific knowledge and to political action. Social behaviour in the form of interconnected practices, systems and institutions is the cumulative outcome of the historical development of a society in its conformity to the Law of Three Stages, each stage bearing within itself the seeds of the next one. In the case of Europe, Comte thought that each of these intellectual stages was correlated with a distinct type of social system: the theological stage with a theological-military system; the metaphysical stage with a metaphysical-legal system; and the positive stage with a scientific-industrial system. A large portion of the second half of the *Cours*, and also volume three of the *Système*, are devoted to the characteristics, historical development and geographical location of the three systems and their correlated stages. Comte's procedure was to begin with what he took to be the basic general properties of the systems—their types of religion, government, commerce, industry and art, for example—and then to account for either their maintenance or their changes by means of reference to more specific factors and local conditions. He did this because he believed that our knowledge of the three stages and their associated systems was superior to our knowledge of particular institutions and customs. Knowing the Law of Three Stages and their systems we know both the past and present of civilization better than we know the sub-sections that they so strongly influence.

In a general way, we can predict, explain, and thus control, aggregate social behaviour whereas we often cannot do this in cases of individual or sectional or local behaviour and beliefs. Our knowledge of the laws of social wholes, and our ability to observe them, is primary; our information about small-scale phenomena is derivative from that we have on large-scale ones. 'All political action,' Comte says, 'is followed by a real and durable result, when it is exerted in the same direction as the force of civilization, and aims at producing changes which the latter necessitates. On every other hypothesis it exerts no influence or a merely ephemeral one' ([6.13], 148). The phrase 'force of civilization' refers to the Law of Three Stages that 'rigorously determines the successive states through which the general development of the human race must pass'. Because 'this law necessarily results from the instinctive tendency of the human race to perfect itself…it is as completely independent of our control as are the individual instincts the combination

of which produces this permanent tendency' ([6.13], 146). One of the obvious benefits of our knowledge of this rigorous succession, according to Comte, is this:

> When in tracing an institution and a social idea, or a system of institutions and a complete doctrine, from their birth to their present stage, we find that, from a given epoch, their influence has always been either diminishing or increasing, we can foretell with complete certainty the destiny which awaits them… The period of their fall or triumph may even be calculated, within narrow limits, from the extent and rapidity of the variations observed.
>
> ([6.13], 151)

Claims to foreknowledge of the pattern of social history held special appeal for an educated, and largely Christian, audience in the nineteenth century. Many people agreed with Comte—and with such groups as the British Chartists, the young Hegelians and later the Marxists—that industrial capitalism was in an economic, social and moral crisis. An explanation of its sources and 'prevision' of its outcome were constantly called for, and equally often supplied either as a supplement to, or substitute for, Christian eschatology, these various considerations emerge very clearly in Harriet Martineau's preface to her translation into English in 1853 of the *Cours*. 'We are living in a remarkable time,' she wrote, 'when the conflict of opinions renders a firm foundation of knowledge indispensable.' She thought that 'for want of an anchorage for their convictions' a great number of people are now 'alienated for ever from the kind of faith which sufficed for all in an organic period which has passed away'. No new firm and clear conviction had taken its place, and although 'The moral dangers of such a state of fluctuation are fearful in the extreme', Comte's work, she believed, was 'unquestionably the greatest single effort to obviate this kind of danger' ([6.11], 1:xxiii–xxiv). For in his work 'We find ourselves living, not under capricious and arbitrary conditions…but under great, general, invariable laws, which operate on us as a part of the whole'. Martineau concluded that despite Comte's singular and wearisome style with its 'constant repetition' and overloaded sentences, positive philosophy opened boundless prospects. It had established, among many other 'noble truths', that 'The law of progress is conspicuously at work throughout human history' ([6.11], 1:xxx).

COMTE'S INFLUENCE

After Comte's death, when positivism had to make its own way without the guidance of its first 'High Priest of the Religion of Humanity', it exerted influence in several ways. The first, and least significant, was by doctrinal descendants and proselytizing enthusiasts, and by friendly critics. Prominent in the last group was Emile Littré, editor of the *Journal des savants,* and a decade later of the highly regarded *Dictionnaire de la langue française*. In the former two groups were Pierre Lafitte, a mathematics teacher not favoured by Comte as his successor but who afterwards was the Professor of History of Science at the Collège de France, and an English band consisting, among others, of Edward Beasly, Professor of History, University College, London; Frederick Harrison,

the lawyer, philosopher and prolific author; F.S. Marvin, historian and author of *Comte: the Founder of Sociology* (1936); and the Anglican clergyman, and former Oxford tutor, Richard Congreve, who in 1867 founded the London Positivist Society and wrote that 'Positivism is the one idea of my life' ([6.56], 49). Both the British and the French societies founded journals that lasted for several decades, and both societies underwent a long series of internal quarrels and schisms. Nevertheless, the various positivist societies with their small number of members, and a Parisian lending library, kept up a programme of meetings, lectures and courses, in addition to their doctrinal rivalry, until the First World War. They strongly agitated for, and gave firm support to, the establishment of both sociology and the history of science as academic fields of study, and they also campaigned, with some success in France, for a scientific and secular education in schools. However, their more ambitious hopes of arousing popular support for the future Religion of Humanity were never fulfilled.

A second, and more important, influence exerted by positivism on the intellectual life of the nineteenth century was independent of both the organized piety of the positivist societies and the messianic aspirations of Comte himself. Through the early enthusiasm of Mill, a number of eminent and able people in Britain came to read and appreciate the *Cours*. They included not only Grote, Whewell and Molesworth, but also G.H.Lewes, consort of George Eliot, and author of *The Biographical History of Philosophy* (1845–6) which favoured positivism, and of *Comte's Philosophy of the Sciences* (1853); George Eliot herself who was impressed by religious positivism; Henry Sidgwick, the Cambridge philosopher, who later criticized Comte's views; John Morley, editor, biographer of Gladstone and highly successful politician; and John Austin, one of the most influential jurists of the nineteenth century. Of these people only Mill and Lewes were ever substantially influenced by Comte in their work, but the earlier editions of Mill's *A System of Logic* (1843) owed much to Comte's methodology and the later Mill still defended the Law of Three Stages. In France, the historian of science Paul Tannery, an editor of the standard edition of Descartes' *Works* (1897–1910), was said to have believed that Comte's influence on him was stronger than that of any other thinker ([6.56], 133). The philosopher of science Emile Meyerson was a friendly critic of Comte, and in *Identity and Reality* (1908) respectfully criticized Comte's ideas on cause, scientific laws, psychology and physics. Claude Bernard, famous as a physiologist and for his book *An Introduction to the Study of Experimental Medicine* (1865), was thought to have been a disciple of Comte until middle age; after 1865 he became a resolute anti-positivist ([6.56], 15). These three men are merely a small sample of Comte's serious readers in France during the half-century after his death. They, like many other philosophers, scientists and historians, took the reading and study of the *Cours* for granted. They absorbed from it the conceptions that seemed to them valuable and discarded or ignored the remainder. Hardly any of the eminent ones among them, however sympathetic to some of Comte's views, could be described as disciples. In that respect they would have bitterly disappointed Comte's expectations for the future success of his system.

Another and most important way in which Comte's influence made itself prominent was through the young Emile Durkheim, the man who in 1887 was the first person appointed to lecture on sociology in a French university. For a few years Durkheim was a

discriminating enthusiast for Comte's conception of the nature of sociology; he adopted much of Comte's belief in the significance of the collective mind in society as the creator and sustainer of religious and moral attitudes, the guarantor of social stability, and the chief bulwark against the loss of self-esteem by the members and their accompanying alienation from common values. However, even though Durkheim's second book, *The Rules of Sociological Method* (1895), attacks positivist claims on many issues, he later reiterated his debt to Comte and 'continued to recommend the *Cours* as the best possible initiation into the study of sociology' ([6.56], 147). Other sociologists of this period, such as Gabriel Tarde, were similarly both critical and appreciative of Comte's work. Much of their kind of discussion was incorporated into the academic teaching of sociology and anthropology throughout Europe and America, and in that form has continued to influence social science until the present day.

In its devotion to major social reform, positivism found a responsive audience among the early Fabians. Like Durkheim, they rejected the anarchic, irrational, inefficient individualism that they took to be the hallmark of materialistic capitalism. Like Saint-Simon and Comte, they wished to create a scientifically organized society in which, to use Gertrude Himmelfarb's words,

> the parts were arranged, ordered, regulated, planned, so as to make for the most efficient and equitable whole. Such a society could come about only through the conscious effort of intellectuals and 'scientists'…who were prepared to dedicate themselves to the public good and bring their superior reason to bear upon the reorganization of the public order.
>
> ([6.35],359–60)

The Fabian collectivist society of the future would be led and presided over, as were the utopias of Comte and Saint-Simon, by a theoretical class devoted to the social good and the elimination of competitiveness. It would be ascetic and non-materialistic as was positivism, and yet evolutionary rather than revolutionary—and so anti-Marxist. These Fabians were not, of course, religious positivists, but as socialists they claimed the politically conservative Comte as one of their own. Five of the seven authors of *Fabian Essays* (1889) were positivist sympathizers:

> Beatrice Webb (then Beatrice Potter) had been familiar with Comte from her schoolgirl reading of Mill, Harrison, and George Eliot; by 1884 her diary contained frequent references to Comte and excerpts from his writings. Long before he met her, Sidney Webb had heard about Comte at the Zetetical Society and later at the London Positivist Society. He and his friends Sydney Olivier, a fellow clerk in the Colonial Office, and Graham Wallas, a young schoolmaster, were so taken with Comte that they embarked upon a systematic reading of all his works.
>
> ([6–35], 358–9)

These four were not the only Fabians who were sympathetic to positivism. Its project of individual moral reform produced by social regeneration, the latter itself the result of the

application of scientific knowledge and method to a sick society, had widespread appeal in the late nineteenth century. It is an appeal which—however viciously distorted by various communist regimes in the twentieth century—is still with us today.

CHAPTER 7
Nietzsche

Robin Small

LIFE AND PERSONALITY

Friedrich Wilhelm Nietzsche (1844–1900) is one of those thinkers whose personalities cannot easily be separated from their achievements in philosophy. This is not because his life was an unusually eventful one in outer respects. Rather, it is due to the intensely personal engagement in thinking that is evident throughout his writings. Franz Rosenzweig's description of Nietzsche as 'the first real human being among the philosophers' is a striking testimony to this characteristic; though Rosenzweig was less justified in dismissing the content of Nietzsche's thinking as irrelevant to his real importance.

Nietzsche was born in 1844 in Röcken, a village in Saxony, the son of a Lutheran minister. After the death of his father four years later, the family moved to Naumburg, where Nietzsche attended the local Gymnasium before being sent as a boarder to the famous Pforta school. He emerged as a classical scholar of great promise, moving on to the universities of Bonn and Leipzig, where he attracted the sponsorship of the influential Ritschl. With his assistance, Nietzsche was appointed at the early age of twenty-four to a chair in classical philology at the University of Basel. His early promise in scholarship was soon overshadowed by new developments. Making the acquaintance of Richard Wagner, Nietzsche was drawn into the Wagner circle, which turned his talents to its own purposes. His first book, *The Birth of Tragedy,* published in 1872, created a storm of controversy. It gave great offence to professional colleagues for its championing of the Wagnerian 'artwork of the future', as well for its unconventional approach to scholarship. But Nietzsche had by now largely lost interest in philology; his writings over the next few years, published under the general title *Untimely Meditations,* are essays in cultural criticism, often stimulating and sometimes brilliant, yet marred by a Wagnerian mixture of pomposity and abrasiveness.

Several events now brought about decisive changes in Nietzsche's life. A breakdown in his health led to a temporary separation from the university; a year's leave was spent in Sorrento, working on a new book, *Human, All-Too-Human,* A break with Wagner followed, brought about primarily by Nietzsche's negative reaction to the 1876 Bayreuth festival and to Wagner's new opera *Parsifal,* whose religiosity aroused Nietzsche's lasting hostility. Two years later, renewed illness led to permanent retirement from the university on a modest pension. From this time onward, Nietzsche was a man seemingly always on the move. He established a regular routine: summers spent in Germany or eastern Switzerland, reading widely and making extensive notes which, during winters on the Italian and French Riviera, were turned into a succession of books. After *Human, All*

Too Human, the works in which Nietzsche's mature style is confidently established followed at regular intervals: *Mixed Opinions and Maxims*, *The Wanderer and His Shadow*, *Daybreak* and *The Gay Science*.

This pattern was to last for a decade. Although restless, Nietzsche was at the same time a man of regular habits. Apart from one not very successful trip to Sicily, he tended to return to the same places, neither cultural centres nor tourist spots but smaller cities in which he lived in inexpensive boarding houses. Always intensely health-conscious, Nietzsche suffered from a variety of illnesses, despite a healthy regime of frugal eating and long walks. Although often alone, he was not a recluse but made friends and joined in social activities. Indeed, he retained a certain Naumburg bourgeois character, which surfaces from time to time in his opinions. Nietzsche the person was no bohemian: conventional in dress and manner, he was also courteous and forbearing in responding to sometimes obtuse correspondents, reserving his polemical skills for his writings. As one observer reported after an 1884 encounter in Nice, 'He was extremely friendly, and there is no trace of false pathos or of the prophet about him, as I had rather feared from the recent works'.

The question of Nietzsche's relations with women has excited and frustrated biographers. He always retained unusually close links with his mother and younger sister, despite a few periods of estrangement. Apart from this, there is evidence for only one significant attachment. After his Sicilian expedition of 1882, Nietzsche visited Rome with his friend Paul Rée, a writer on moral psychology. There he met a young Russian girl, Lou von Salomé. An intense emotional period followed, during which the two men conducted a fierce, but unacknowledged, rivalry for Lou's loyalty. The outcome was an estrangement, incited by the hostility of Nietzsche's conservative sister Elisabeth, though also due, in part, to Nietzsche's own conventional side. A disillusioned Nietzsche returned to the Italian Riviera and began work on a new kind of writing, *Thus Spoke Zarathustra*. The successively published parts of this, his best known work, occupied him for several years.

In 1886 Nietzsche returned to the format of *The Gay Science* with his most accomplished book, *Beyond Good and Evil*. The subsequent year produced a bold exploration of moral concepts, *The Genealogy of Morals*. During the autumn of 1888, Nietzsche's letters and writing took on an ominous tone of exaltation, as he worked on a series of works in rapid succession: *Nietzsche Contra Wagner*, a summary of his long campaign against his former friend; *The Antichrist*, a polemic against Christianity; and a remarkable autobiographical essay, *Ecce Homo*. In the early days of 1889, Nietzsche suffered a sudden mental collapse in the streets of Turin, where he was spending the winter. Brought back to Germany by a friend, he was treated in a Jena asylum, but without improvement, and afterwards nursed at home by his mother and sister. Nietzsche never regained mental clarity, and underwent a steady physical decline until his death in 1900. The cause of the catastrophe is unconfirmed, but the initial diagnosis of syphilis seems the likeliest explanation.

WORKS AND STYLES

Nietzsche's style of writing is very varied: hardly two of his books can be put in a given category. Works such as *Human, All Too Human* and *Daybreak* are often described as 'aphoristic', though they are really composed of short essays, often carefully arranged in an overall progression of thought. One philosophical style hardly ever used by Nietzsche is that of extended argument. He gave an indication of his strategy when he wrote: 'I approach deep problems like cold baths: quickly into them and quickly out again' (*The Gay Science*, section 381). Yet Nietzsche returns to these problems again and again, and one can often see patterns in his ways of approaching them: not only continuities, but variations on a theme, developments of a line of thinking, reactions against former approaches, ideas gained from other thinkers, and ventures into new alternatives. The consistencies over the twenty years of his writing life are of style rather than doctrine.

Particularly striking is Nietzsche's use of the aphorism, which serves, as he puts it, 'to say in a few words what other writers say in a book—or do *not* say in a book'. We can take, as a typical example, section 126 of *The Gay Science: 'Mystical explanations*. Mystical explanations are considered deep. The truth is that they are not even superficial.' Setting aside its superfluous title, this is a genuine aphorism, a self-contained thought which nevertheless lends itself to interpretation and elaboration. The 'mystical' is anything that refers to something higher, as when some experience is explained as the voice of God. The 'superficial' is the surface of things, the qualities experienced through the senses. Thus, the opposition invoked is that between appearance and reality. In the metaphysical tradition of Plato, appearance is devalued as in need of explanation by reference to a truer reality. But Nietzsche, who called his thinking an 'inverted Platonism', wants a greater respect for appearance. Science, he suggests, has advanced only in so far as the senses have been trusted; and so we do not need to flee from appearance, but to engage more closely with both inner and outer phenomena; and metaphysical explanations merely distract us from that task. Typically, however, Nietzsche elsewhere takes a different line, praising the courage of those who have repudiated the evidence of the senses, like Parmenides and Plato in metaphysics, and Copernicus in natural science.

Putting Nietzsche's thought into traditional philosophical categories, such as idealism or materialism, rationalism or irrationalism, is a vain exercise. Sometimes he is included in the assortment of thinkers labelled 'existentialists'. This is an arbitrary and in some ways misleading categorization which, with a greater appreciation of Nietzsche's thought, has now gone out of use. One can at most specify certain recognizable philosophical principles for which Nietzsche often expresses support: the idea that the world is one of becoming, not of being, and as a consequence of this, an opposition to any doctrine that posits a reality over and above the world of appearance. An important corollary is the rejection of traditional religion, not only as a metaphysical doctrine but also in its implications for moral concepts. These points are closely linked with Nietzsche's professed admiration of Heraclitus; in his own words:

> The affirmation of passing away *and destroying*, which is the decisive feature of a Dionysian philosophy; saying Yes in opposition and war; *becoming*, along with a radical repudiation of the very concept of *being*—all this is clearly more closely related to me than anything else thought to date. The doctrine of the 'eternal recurrence' that is, of the unconditional and infinitely related circular course of all things—this doctrine of Zarathustra might in the end have been taught already by Heraclitus.
>
> (*Ecce Homo*, 'The Birth of Tragedy', 3)

Nietzsche wants to be an affirmative thinker, a 'yes-sayer'. But the possibility of such an affirmation depends on overcoming a system of concepts that have dominated human thinking. Hence he is, in practice, a critical thinker—indeed, one of the most destructive in the history of philosophy. Nietzsche provides a critique of knowledge, and its concept of truth and objectivity; of morality, and its concepts of good and evil; of philosophy, and its concept of being or reality; and of religion, and its concept of God. In each case, Nietzsche champions the concepts rejected by these systems: he affirms the value of lies, of fate, of semblance and becoming. But his critiques are not external ones; he argues that the highest values *devalue themselves*. To take an example: the will to truth is something we owe to the Christian tradition, which judged the world of appearance as one of untruth, and so posed the task of finding genuine truth. But the determination to follow a line of thought to its end—not a natural human trait, but a capacity acquired with great difficulty—has led to the downfall of those beliefs. We now recognize that our knowledge is based on metaphors; and a metaphor, because it asserts the identity of what is not identical, is really a lie. It is these lies that human beings need to create a world of stable and regular objects, within which they can live.

In his early sketches, Nietzsche supports this view of knowledge by using a vocabulary of rhetoric rather than logic. The basic operation of thought is not unconscious inference, as suggested by some neo-Kantians. Rather, figures of speech provide the model for all thinking: in particular, metonymy and metaphor are its crucial operations. Language, Nietzsche suggests, consists entirely of metaphors; and metaphor, which equates the unequal, is a lie, or perhaps a riddle.

> What, then, is truth? A mobile army of metaphors, metonyms, and anthropomorphisms—in short, a sum of human relations, which have been enhanced, transposed, and embellished poetically and rhetorically, and which after long use seem firm, canonical, and obligatory to a people: truths are illusions about which one has forgotten that this is what they are; metaphors which are worn out and without sensuous power; coins which have lost their pictures and now matter only as metal, no longer as coins.
>
> ('On Truth and Lie in an Extra-Moral Sense')

These ideas about knowledge suit the Heraclitean concept of absolute becoming which, as Nietzsche understands it, implies a process which has no beginning or end, and contains no pauses. 'If there were just one moment of being in the strict sense,' he writes, 'there could be no further becoming.' Yet that is not how we ordinarily understand the world.

Our organs of perception are geared to the conditions of our survival, and they allow us to apprehend only a minute fraction of what happens. Hence we suppose that there are discontinuities and separate things: even the most fleeting process, such as a flash of lightning, is imagined as the activity *of* something. Our language contains philosophical assumptions: 'Every word is a prejudice' (*The Wanderer and His Shadow*, section 55). Because the Indo-European languages contain the distinction between subject and activity, they determine our conceptual bias towards belief in permanent or at least enduring beings, and lead inevitably to belief in the soul and in material substance. The line of thought here is akin to the more recent hypotheses concerning the determining influence of language structure on our ways of seeing the world. But our conditions of life demand such illusions; for absolute becoming makes the world ungraspable. Hence we invent fictions which enable us to make sense of the world, such as things, and hence numbers and formulae. Nietzsche is not proposing any move to a new language: even Zarathustra, who proclaims a 'new speech', still uses German. It seems that we must go on using the only language available to us, while acknowledging that its concepts are inadequate to reality.

INFLUENCES AND REACTIONS

A search for direct influences on Nietzsche is not very rewarding. He did speak of a supposed group of 'new philosophers'; but in reality, Nietzsche had no philosophical associates. Schopenhauer and Wagner are often mentioned as early influences. Nietzsche gained much from both—as thinkers he could react against, primarily in ethical and aesthetic concepts respectively. Schopenhauer was an early passion, and the subject of an 'untimely meditation' which makes no mention of transcendental idealism, pessimism and the doctrine of the will as essence of the world; instead, Schopenhauer's independence and hatred of philosophical obscurantism are celebrated. Emerson was an influence for similar reasons. His essay form, flexible and loosely structured, was very congenial to Nietzsche. Again, the doctrines are hardly important, and the idea of an 'over-soul' common to all thinkers is the opposite of Nietzsche's view. Yet he retained a high opinion of Emerson, and an essay such as 'Self-Reliance', with its forthright rejection of any consistency in belief or action, has a very Nietzschean ring: 'Speak what you think now in hard words; and tomorrow speak what tomorrow thinks in hard words again, even though it contradict everything you said today'. Moreover, the Emersonian emphasis on the will has a direct relation to Nietzsche's later idea of the will to power.

Among philosophers of a more academic kind, Nietzsche's reading was largely in contemporary writers, some not much known even in their day, let alone a century later. Two figures worth attention are the idealists Friedrich Albert Lange and Gustav Teichmüller. In *Beyond Good and Evil*, Nietzsche pays a generous tribute to both thinkers for the courage of their metaphysical thinking—at the same time as he rejects their principal theses. Nietzsche studied Lange's important *History of Materialism* shortly after its publication in 1865, and often returned to it later. It was a fortunate encounter, for the book provides a comprehensive survey of materialist thought, from Democritus to the nineteenth century. Just as valuable is Lange's responsible and fair-minded approach,

which gives full credit to the contributions of the materialist philosophy, while in the end rejecting it in favour of a neo-Kantian idealism. Lange characterises materialism as a conservative force in science, emphasizing facts at the expense of ideas, hypotheses and theories. He recommends a more speculative approach, raising even paradoxical questions. Materialism 'trusts the senses', Lange says, and it pictures the world accordingly. Yet the scientific investigations that arise on this basis undermine philosophical realism. Lange's treatment of perception is like that of Hermann von Helmholtz: when we understand how information received by the senses is transformed by our sensory apparatus, we must conclude that the world as we perceive it is really a product of our organization. This includes our own sense organs, since their status as objects of perception is no different from other things. Nietzsche rejects Lange's argument as incoherent: 'But then our organs would be—the work of our organs! It seems to me that this is a complete *reductio ad absurdum*' (*Beyond Good and Evil*, section 15.) In contrast, he suggests that 'Today we possess science precisely to the extent to which we have learned to *accept* the testimony of the senses—to the extent to which we sharpen them further, arm them, and have learned to think them through to the end.' (*Twilight of the Idols*, '"Reason" in Philosophy', section 2.) This is not realism, but 'sensualism', an affirmation of appearance in its own right, however unstable and contradictory it may be.

In 1882 Nietzsche read a newly published book entitled *Die wirkliche und die scheinbare Welt (The Real and the Apparent World)*, by a former Basel colleague, Gustav Teichmüller. From this work he gathered several concepts of great use for his subsequent thinking. Central to Teichmüller's metaphysical system is the idea of 'perspective'. The defect of dogmatism in all its forms is, he argues, its failure to appreciate that all philosophies are 'protective' or 'perspectival' images of reality from a certain standpoint. The same is true of the knowledge of everyday life, in which we rely on what Teichmüller terms 'semiotic' knowledge, that is, a translation of phenomena into the vocabulary of a particular sense. Even our own mental states are known in this way alone. Each sense has its own 'sign language', and philosophy has been dominated by a bias in favour of sight; we need to overthrow this dictatorship and establish a kind of democracy of the senses and their corresponding concepts. Treating space and time as perspectival concepts, Teichmüller arrives at a conventionalist account, according to which questions about infinity reduce to arbitrary decisions about measurement. Materialism and idealism are alike inadequate, because they remain within their limited perspectives. Teichmüller's own system posits an intellectual intuition of the real self, a timeless subject which, transcending all perspectives, is their ultimate source.

With the exception of this last point, Nietzsche's own view of knowledge takes up many of Teichmüller's themes. His most striking idea is usually referred to as 'perspectivism', though in fact Nietzsche uses the word *Perspektivismus* not for a certain doctrine but for the property of being perspectival, that is, for 'perspectivity'. The assertion that there are only perspectives, without the underpinning supplied by either things-in-themselves or by a 'real' self, implies an opposition to objectivity, or at least to one version of objectivity. Nietzsche says that we need to control our drives 'so that one knows how to employ a *variety* of perspectives and affective interpretations in the service of knowledge'. This leads to a truer conception of objectivity: 'There is *only* a

perspective seeing, *only* a perspective "knowing"; and the *more* affects we allow to speak about one thing, the *more* eyes, different eyes, we can use to observe one thing, the more complete will our "concept" of this thing, our "objectivity" be' (*The Genealogy of Morals*, Third Essay, section 12). Nietzsche often asserts that we are prisoners of our human perspectives, forever unable to see 'around our corner'. Yet he also suggests that artists have the ability to provide us with otherwise unavailable perspectives; and he claims for himself a special talent for 'reversing' perspectives. A condition of this genuine objectivity is an avoidance of 'convictions', that is, of beliefs purporting to possess certainty. 'Convictions are more dangerous enemies of truth than lies,' Nietzsche writes (*Human, All Too Human*, section 483). Avoiding convictions does not imply an ironic withdrawal from engagement and commitment: on the contrary, we should 'live dangerously' in the quest for knowledge, risking ourselves in following an hypothesis as far as it can be taken.

These concerns are crucial in Nietzsche's attitude towards science. Cut off from primary scientific sources by his lack of mathematics, Nietzsche browsed widely among popular science and *Naturphilosophie*, and was aware of current debates—for instance, over the implications of the second law of thermodynamics. Many of these authors were what one might term vulgar Leibnizians, writers opposed to mechanism for its supposed superficiality and soullessness, and often willing to suggest a close link between materialism and the English national character. Nietzsche's approach is free of this tone, and his assessment of materialism is of far more interest.

For Nietzsche, mechanism is first and foremost a *methodology*. Its ideal, he says, is 'to explain, i.e. put into formulae, as much as possible with as little as possible.' ([7.5], 7/3. 158). The best theory is the one which uses the fewest concepts, while encompassing the most natural phenomena. This idea is well known in Ernst Mach's formulation of the 'principle of economy'. But Nietzsche links it with a main theme of his own: the will to power. Scientific theory enables us to exert more control over our environment. More importantly, however, scientific theory is itself a form of power. Mechanism is the most advanced and successful form of science, just because it embodies this scientific imperative in its purest form, nowhere seen more than in *reductionism*, its essential strategy and the key to its greatest successes.

Nietzsche's complaint against materialism is that it has not pushed its own programme far enough. He took the dynamic physics of Boscovich to represent a further step. Whereas Copernicus overcame the belief in the stability of the earth, Boscovich opposed an equally deep prejudice: the notion of material substance. The outcome is a theory in which solid material atoms are replaced with unextended 'points of matter' (in the terminology of Faraday, 'centres of force') whose spatial fields produce all the familiar modes of interaction with other centres: repulsion, cohesion and mutual impenetrability. Boscovich thus eliminates not only the distinction between matter and force but also the distinctions between kinds of force.

Another concept to be eliminated is, Nietzsche considers, that of causality. Materialism eliminates teleology, and uses only causal explanation; yet Nietzsche suggests that efficient causes are not alternatives to final causes, but only disguised versions of them. Scientific formulae establish quantitative equalities (in terms of energy or mass) between states of affairs, which make no mention of cause and effect. Thus, Nietzsche argues,

science should give up any pretence to provide *explanations* of phenomena, and content itself with an accurate description of them. If explanation is turning the unfamiliar into the familiar, then it appeals to what we take to be familiar, the everyday experience of what can be seen and felt, and the even more familiar processes of our own minds, thinking, willing, and so on. However, the seeming certainty of these phenomena is an illusion. Even the simplest experience, the 'I think', turns out on closer examination to contain a number of assumptions, such as the distinctness of the subject from the process of thinking. Summarizing these critiques, Nietzsche writes:

> When I think of my philosophical genealogy, I feel in agreement with the anti-teleological, i.e. Spinozistic movement of our time, but with this difference, that I hold even the 'aim' and 'will' *within us* to be an illusion: similarly with the mechanistic movement (tracing all moral and aesthetic questions back to physiological ones, all physiological to chemical ones, all chemical to mechanical ones) but with this difference, that I do not believe in 'matter' and hold Boscovich to be one of the great turning-points, like Copernicus.
>
> ([7.5], 7/2:164)

Also unusual in Nietzsche's approach to science is his refusal to separate scientific thought from the personality of the scientist. The original founders of science, the materialist thinkers of ancient Greece, were free spirits. Modern scientists are less admirable: unlike the poet Lucretius, they are prosaic minds, who turn science into a routine procedure, relying on measuring and calculating to ensure security. Their materialism is taken as a doctrine, when it should be a provisional hypothesis, allowing us to run ahead of our present knowledge into unknown areas. With this in mind, we cannot separate these ideas from Nietzsche's more obviously imaginative and speculative writings.

THUS SPOKE ZARATHUSTRA

Nietzsche regarded *Thus Spoke Zarathustra* as his most important achievement. The work's subtitle, 'A Book for Everyone and No one', conveys its mixture of accessibility and inaccessibility. In style, it is most obviously modelled on the Bible; and Nietzsche may have gained a hint of the possibilities of Biblical pastiche from Mark Twain's satirical description of the Mormon scriptures. Although the name 'Zarathustra' is borrowed from the ancient Iranian figure, there is no particular relation between Nietzsche's protagonist and the historical Zarathustra. Rather, Nietzsche has chosen a format which allows a dramatic and poetic presentation of ideas which could hardly be expressed in a more conventional manner. Although he had been preparing and making notes for the composition for some time, the actual writing of each instalment was done in a few weeks. This may account for the spontaneity of many passages, but it cannot be denied that the level is uneven. Zarathustra is forceful, poetic, thoughtful and satirical; he can also be rambling and querulous or, worse still, as sentimental as his all-too-legitimate descendant, Kahlil Gibran's best-selling 'Prophet'. Especially in Part Three, the careful

organization of Nietzsche's earlier books is lacking; and the turn to a kind of satirical burlesque in Part Four, while it has some admirers, is seen by most (including, perhaps, its author) as failing to achieve its intentions. Martin Heidegger advised that we ought to read *Thus Spoke Zarathustra* just as rigorously as we read a work of Aristotle—though he added that this does not mean in precisely the same way ([7.40], 70). There is much in this, even though, knowing something of Nietzsche's personal life, we recognize various allusions in the text.

In Part One Zarathustra is introduced as a sage who, weary of his solitary possession of wisdom, descends from a mountain retreat to bring it as a gift to humanity. In a marketplace he announces to an unreceptive audience his message of self-overcoming, the process of transforming oneself into something higher through turning passions into 'virtues'. The aim in this process is what Zarathustra calls the *Übermensch*. (Since some readers are distracted by the overtones of English words like 'superman', recent practice has been to leave the term untranslated.) This idea has often been misinterpreted: it has nothing to do with any evolution of the human species towards a more 'advanced' form. Even taking it as the development of a single person is too literal, since Zarathustra's further discourses specify the problem in terms of forces or impulses *within* the individual. We have no literal vocabulary for these, it seems, and so need to personify them. The *Übermensch* is thus a symbol for higher states of being, as when Nietzsche speaks of 'the invention of gods, heroes, and *Übermenschen* of all kinds' (*The Gay Science*, section 143).

The relation between soul and body is a main theme in Part One. Zarathustra insists that the soul is not separate from and superior to the body. On the contrary, the soul is an instrument of the body, and its characteristics express the state of the body—where 'body' is to be understood as a collection of impulses and drives. Our virtues arise from the body, and are indissolubly linked with the passions that morality usually condemns. Hence those who seek refuge in a world 'beyond' are enemies of life, whose assertions are only symptoms of their own sickness and weariness of life. Zarathustra's scorn for these 'preachers of death' is expressed in a series of fierce denunciations.

Part Two is more poetic, and we now catch glimpses of the higher state, as important themes emerge with greater emphasis. Zarathustra states his task as the 'overcoming of revenge': 'For *that man may be delivered from revenge*, that is for me the bridge to the highest hope, and a rainbow after long storms'. The key to this liberation is the creative will, which, as a 'will to power', is identified as the essence of life itself. Yet Zarathustra notes that one obstacle stands in the way of this otherwise omnipotent power: its own past.

> But now learn this too: the will itself is still a prisoner. Willing liberates; but what is it that puts even the liberator himself in fetters? 'It was'—that is the name of the will's gnashing of teeth and most secret melancholy. Powerless against what has been done, he is an angry spectator of all that is past. The will cannot will backwards; and that he cannot break time and time's covetousness, that is the will's loneliest melancholy.
>
> (*Thus Spake Zarathustra*, Second Part, 'On Redemption')

Because the will cannot will backwards, it suffers from frustration and anger, and *revenge* is its attempt to escape from the predicament. Revenge can be understood at various levels. As a common pattern of social behaviour, it expresses a mixture of motives, ranging from immediate self-preservation to a maintenance of social prestige (*The Wanderer and His Shadow*, section 33). In a narrower sense, revenge is an attempt to redirect one's own pain on to others, under the pretext that their 'guilt' requires them to suffer. From that rationalization in turn derives the whole apparatus of moral thinking and, for that matter, the concept of the individual subject as bearer of moral responsibility. Ultimately, however, revenge is concerned with time: 'This, indeed this alone, is what revenge is: the will's ill-will against time and its "It was"'. It is this alone that accounts for the extraordinary prevalence of revenge, or rather of its intellectual form, the 'spirit of revenge', across the range of human thinking.

Just what is it that makes the past a problem here? Not, it seems, its factual content, but simply its pastness. In that case, whether the events and acts of the past were good or bad, pleasurable or painful, is irrelevant. So is the distinction between actions and mere happenings: one's own past actions, having become past, are as far removed from the power of the will as anything else that has taken place. The past is thus an undifferentiated totality. The solution, if there is one, to the problem of the past must enable us to *affirm* the past as a whole, not just with its pains but with its trivial and meaningless elements. There must, Zarathustra hints, be a way of transforming 'It was' into 'Thus I willed it' and, in turn, into 'Thus I will it; thus shall I will it'. The thought of eternal recurrence, to be considered below, must be seen in that light.

In Part Three of *Thus Spoke Zarathustra*, Nietzsche enters into deeper themes. Peaceful episodes of exalted mystical feeling alternate with stormy scenes of confrontation and struggle, as Zarathustra comes slowly and reluctantly to accept his role as teacher of the eternal recurrence. It is clear that this thought, more than any other, is only for those few who are ready to let it gain power over them. A fourth part of the work changes direction again, with Zarathustra's encounters with the 'higher men' who, in different ways, illustrate the pitfalls in the way of self-overcoming. The intended tone is satirical—but modelled on the ancient satyr plays which followed performances of Greek tragedy. Nietzsche himself was apparently dissatisfied with Part Four since, after having copies privately printed, he withdrew it from circu-lation. Whether *Thus Spoke Zarathustra* can be regarded as a completed work is doubtful. Certainly, many of its themes are left unresolved, not least the one that Nietzsche called the 'fundamental conception' of the book, the thought of eternal return.

ETERNAL RECURRENCE

On his own account, the idea of the eternal return came to Nietzsche quite suddenly, during his summer residence in Switzerland in August 1881. Yet his notebooks of the time reveal a wide reading in popular science and philosophy of nature, including discussions of the idea of recurrence. From the beginning, the idea is sketched out by Nietzsche in several forms. In his notebooks, though not in published works, he sketches an argument using the vocabulary of science. The key to this line of thought is

Nietzsche's finitism. He takes the world to be a finite amount of energy, within a space which is also finite although unbounded. If the world consists of a finite number of 'centres of force', and any state of affairs consists in some configuration of these elements, then the number of possible states of affairs must be finite; or so Nietzsche supposes: critics have pointed out that this is a *non sequitur*, supposing space to be a continuum. But the time within which changes occur is infinite. Nietzsche insists on an infinitude of past time, since a beginning for the world would raise the question of its cause, and perhaps invite a theistic answer. Therefore, after a long but finite period of time, the whole range of possible situations must be exhausted, and some past state will reappear. Such a recurrence of a single total state will lead to the recurrence of the whole sequence of states, in exactly the same order, leading to another complete cycle, and so on into infinity.

This is not a wholly original argument: something similar can be found in earlier philosophers, going back at least as far as Lucretius. With the required premisses, it has the look of a valid demonstration. If we suppose that whatever is possible must occur in an infinite time, that past time is infinite, and that the present state of affairs is a possible one, it follows that this state must already have occurred in the past, not just once but infinitely many times. Similarly, it must occur again infinitely many times in the future. Once a principle of causal determination is added, it follows that the whole course of events leading up to this moment, as well as that following from it, must recur eternally in the same sequence.

As a line of thought, all this is somewhat inconsistent with Nietzsche's expressed views. A vocabulary of static 'states' is at odds with his support of a Heraclitean doctrine of absolute becoming, which allows no standstill, even the most momentary one. Further, the argument relies on a causal determinism stated in terms of necessary relations between 'total states' of the universe. Elsewhere Nietzsche maintains that reality consists not of momentary states related by cause and effect but rather of extended processes which are somehow 'intertwined' or 'entangled' with one another. Causality cannot explain why there should be any change at all, or why change should occupy some finite amount of time, instead of being instantaneous. Nietzsche proposes to explain the finite duration of processes by an inner conflict of forces, a conception bound up with the idea that the will to power is found in physical as well as psychical processes.

In these sketches, the theory of eternal recurrence is arrived at by eliminating two other accounts of the world. The view that becoming continues endlessly into new states of affairs is, Nietzsche argues, excluded by the finitude of the universe. On the other hand, the idea of a final state, one in which all change comes to an end, is refuted by immediate experience. Given an infinitude of past time, such an ending would already have been reached; and, if reached, it would never have given rise to further development, assuming no divine intervention. Since our thinking shows that becoming has not come to an end, a final state must be impossible. This leaves only one possibility: that the same states are repeated again and again, infinitely many times. Now this procedure is not very consistent with Nietzsche's programme for scientific thinking: a theory arrived at by elimination is not a daring hypothesis, or even a particularly imaginative conception. In any case, a scientific theory of eternal recurrence, however valid, does not account for anything in our experience, and so has no value for scientific explanation; it is just a final

consequence of premisses already accepted. We could see all this as an *ad hominem* strategy, arguing with science on its own grounds, and using its own principles of thought. Arguing ideas to their final consequences, even to the point of absurdity is, after all, valued by Nietzsche as a mark of integrity.

In Nietzsche's published works, the idea of eternal recurrence is always presented in a dramatic context of confrontation and challenge. This is especially true of the striking section of *The Gay Science* in which the idea is first introduced:

> What, if some day or night a demon were to steal after you into your loneliest loneliness and say to you: 'this life as you now live it and have lived it, you will have to live once more and innumerable times more; and there will be nothing new in it, but every pain and every joy and every thought and sigh and everything unutterably small and great in your life will have to return to you, all in the same succession and sequence—even this spider and this moonlight between the trees, and even this moment and I myself. The eternal hourglass of existence is turned upside down again and again, and you with it, speck of dust!'
>
> Would you not throw yourself down and gnash your teeth and curse the demon who spoke thus? Or have you once experienced a tremendous moment when you would have answered him: 'You are a god and never have I heard anything more divine.' If this thought gained possession of you, it would change you as you are and perhaps crush you. The question in each and every thing, 'Do you desire this once more and innumerable times more?' would lie upon your actions as the greatest weight. Or how well disposed would you have to become to yourself and to life *to crave nothing more fervently* than this ultimate eternal confirmation and seal?
>
> (*The Gay Science*, section 341)

Here the thought of recurrence is announced, not demonstrated. There is no question of a debate, or even of a choice between acceptance and rejection. Each of us will presumably respond according to the sort of person we are. One possible reaction is a complete collapse. In this respect, the thought is something like the doctrine of eternal punishment; in fact, Nietzsche's depiction of this outcome owes much, surprisingly, to English accounts of Methodist preaching. But the thought is also presented as a power for transformation into a higher state, in which one is able to affirm 'each and every thing' as having a status which is a kind of approach to eternal being, without an imagined escape from the course of becoming.

The element of challenge is just as evident in a powerful chapter of *Thus Spoke Zarathustra* (Third Part, 'On the Vision and the Riddle'). Zarathustra describes an episode in which he confronts his enemy, the dwarflike 'spirit of gravity', and initiates a contest of riddles. He points out a gateway which stands between two lanes, stretching forwards and backwards into an infinite distance. The gateway, at which they come into conflict, has a name: 'Moment'. Zarathustra poses a question: do the lanes contradict one another eternally? The dwarf answers that 'time itself is a circle'—implying that any conflict between past and future is a mere semblance. Angered by the evasion,

Zarathustra retorts with a direct statement of the thought of recurrence: must not everything that runs on these lanes do so again and again? The dwarf, apparently unable to confront this idea, disappears from the scene. A new turn follows, as Zarathustra describes a vision which is also a riddle. A young shepherd is choking on a 'heavy black snake' which has crawled into his throat. The shepherd bites the head off the snake, and leaps up, transfigured: 'one changed, radiant, *laughing*!' What does this mean? The question remains unanswered. Perhaps Nietzsche is unwilling to eliminate the tension and enigmatic character of this situation, or alert to Emerson's suggestion that 'The answer to a riddle is another riddle'.

Some aspects of the theme of eternal recurrence are shared by another main idea of Nietzsche, the 'death of God', first announced in section 125 of *The Gay Science:*

> Have you not heard of that madman who lit a lantern in the bright morning hours, ran to the market place, and cried incessantly, 'I seek God! I seek God!' As many of those who do not believe in God were standing around just then, he provoked much laughter. Why, did he get lost? said one. Did he lose his way like a child? said another. Or is he in hiding? Is he afraid of us? Has he gone on a voyage? or emigrated? Thus they yelled and laughed. The madman jumped into their midst and pierced them with his glances.
>
> 'Whither is God' he cried. 'I shall tell you. *We have killed him*—you and I. All of us are his murderers… God is dead. God remains dead. And we have killed him…. Is not the greatness of this deed too great for us? Must we not ourselves become gods simply to seem worthy of it? There has never been a greater deed; and whoever will be born after us—for the sake of this deed he will be part of a higher history than all history hitherto.'

As in *Thus Spoke Zarathustra,* the message is not received by the marketplace crowd; and the 'madman' acknowledges the failure of his mission. He has come too early, he says.

> This tremendous event is still on its way, still wandering—it has not yet reached the ears of man. Lightning and thunder require time, the light of the stars requires time, deeds require time even after they are done, before they can be seen and heard. This deed is still more distant from them than the most distant stars—*and yet they have done it themselves*.

It must be noted that the message of the death of God is addressed not to believers but to 'those who do not believe in God'. The assumption is that there are no believers in the modern world, or at least in the marketplace, symbol of mass society. When Zarathustra encounters one believer, a hermit who lives apart from society, he refrains from revealing that God is dead; the message is only for those who have brought it about. The hermit is 'untimely' too, and would appear as absurd in the marketplace as the madman. There, support for Christianity is not an error, Nietzsche alleges in *The Antichrist,* but a deliberate lie. 'Everyone knows this, *and yet everything continues as before*.' Nietzsche's target here is those who have abandoned traditional religion yet who assume that morality

can be continued in the same way. ‘They are rid of the Christian God and now believe all the more firmly that they must cling to Christian morality… Christianity is a system, a *whole* view of things thought out together. By breaking one concept out of it, the faith in God, one breaks the whole: nothing necessary remains in one’s hands.’ Nietzsche is insisting on understanding the full implications of disbelief. It puts in doubt not just the explicit content of old beliefs but the standards of knowledge and morality whose foundations they supplied. The madman expresses this as the predicament he and his listeners are in, whether they realize it or not.

As with the thought of eternal recurrence, Nietzsche’s emphasis is on the consequences of the idea, rather than on reasons for supporting it. His atheism does not arise from any critique of arguments for the existence of God. Once we have a psychological account of the origin of belief in God, he argues, ‘a counter-proof that there is no God thereby becomes superfluous’ (*Daybreak*, section 95). Elsewhere his atheism seems to be not a reasoned view but a stipulation. Zarathustra says: ‘If there were gods, how could I endure not to be a god? *Hence* there are no gods.’ His real objection is to the *concept* of God, as a denial of life and, in turn, a symptom of a lack of creative power within individuals and groups.

In this way, the ‘death of God’ is part of a wider theme: what Nietzsche, in his last years of work, termed ‘nihilism’. The collapse of all values, even that of truth, has led to a historical situation of hopelessness. ‘One interpretation has collapsed; but because it was considered *the* interpretation it now seems as if there were no meaning at all in existence, as if everything were in vain’ (*The Will to Power*, section 55). Within philosophy, scepticism and pessimism fit into this picture, as symptoms of decline—ultimately, Nietzsche suggests, owing to physiological causes. But he makes an important distinction between two kinds of nihilism. *Active* nihilism is an expression of strength, while *passive* nihilism is a sign of weakness. Active nihilism finds satisfaction in destroying old illusions, and the will to pursue ideas through ‘to their ultimate consequences’, even to absurdity. This is just the truthfulness that leads to a paradox, by putting the question of its own origin and value, and thus undermining its own validity. Affirmative nihilism represents a preparation for a new phase of creativity. In the symbolic language of *Thus Spoke Zarathustra*, it is the strength of the lion, courageous and defiant, who destroys the authority of every ‘Thou shalt’ and assumes the lonely task of setting up his own values.

NIETZSCHE AS PSYCHOLOGIST

Nietzsche often called himself a ‘psychologist’ rather than a ‘philosopher’. What he meant has little to do with any science of behaviour modelling itself on the physical sciences. In the first section of *Human, All Too Human*, he uses the metaphor of ‘sublimation’, taken from physical chemistry, to express the transformation of lower into higher impulses. (Borrowed by Freud, this expression has become common.) Moral and religious sentiments do not have a higher origin, or give access to any realm of values; their difference from lower impulses is one of degree, not of kind. Crucial to this picture is a rejection of the unity of personality. The self is, in fact, a plurality of forces—

Nietzsche says ‘personlike’ forces, whose relation to one another is a sort of political structure. A healthy and strong personality is one which has a well organized structure amongst its drives and impulses. Despite his talk of the ‘will to power’, Nietzsche regards the will in its usual sense as a fiction. When we analyse the typical ‘act of will’ we find a mixture of various elements: sensations of the ‘before’ and ‘after’ states, of the movement, of the thinking, and above all of the ‘affect of superiority’ associated with an inner commanding. This last is close to synonymous with the will to power. But where that concept comes to the fore is in biology, where it allows Nietzsche to oppose Darwinism, or at least what he takes to be the Darwinist emphasis on the will to live: ‘The physiologists should take heed before they assume self-preservation as the cardinal drive of an organic being. Above all, a living being wants to discharge its energy: life as such is will to power. Self-preservation is only one of its indirect and most frequent consequences’ (*Beyond Good and Evil*, section 13).

For many philosophical questions, it is difficult to separate psychological and metaphysical components in Nietzsche’s approach. His critique of pessimism is an example. Nietzsche argues that it is absurd to make any judgement about the value of the world as a whole, simply because there can be no external measure by which to assess it. If pessimism means that there is more pain than pleasure in life, it implies a hedonism which Nietzsche regards as a superficial psychology. Pleasure and pain are not ‘facts of consciousness’, phenomena whose nature is self-evident, but themselves interpretations, and therefore dependent on context for their meaning. Accordingly, Nietzsche attacks utilitarianism for its uncritical view of pleasure and pain, as well as its appeal to quantitative calculation: ‘What can be counted is worth little’.

Similarly, valuing oneself is entirely dependent on what sort of self this is; despising oneself may represent a higher state. The egoism that Nietzsche advocates is unlike the common version, in that it involves no solicitude for the existing self; that is a sign of weakness, not strength, and a failure in the important task of self-overcoming. Further, the ‘self that such importance is placed upon is a very secondary phenomenon, often merely the product of others’ expectations. The personality that we are aware of in our everyday lives is only the surface of what we are, and the thoughts and motives we attribute to ourselves are only the end-products of the real processes going on within us. A genuine egoism must direct our attention towards the real self, and bring about a transformation of the person. It must be an affirmation of becoming, implying not just change but conflict, contradiction and even destruction. Conflict has to be seen as a positive and creative process, in the spirit of Heraclitus’s statement that ‘War is the father of all things’. Becoming is not just a philosophical concept but something to be affirmed in our lives, by committing ourselves to the process of self-transformation. As Emerson said, ‘Power ceases in the instant of repose’. Affirming becoming means affirming conflict, between individuals and groups of individuals, but also within ourselves.

A constant theme in Nietzsche’s writing, from its earliest period, is his rejection of the freedom of the will and endorsement of a fatalist view of becoming, for which ‘Event and necessary event is a tautology’. But Nietzsche opposes what he calls ‘Turkish fatalism’, which separates human beings from circumstances, and sees them as the passive victims of impersonal, incomprehensible forces. We must realize that we are ourselves a part of nature, and exert as much influence over what is to come as does any other factor. On the

assumption that all things are connected with one another, even our most trivial acts make a difference to the whole course of later events. This notion of *ego fatum* is closely related to another: *amor fati*, often invoked in enthusiastic tones, as Nietzsche asserts that we must not merely accept fate but love it: 'My formula for greatness in a human being is *amor fati:* that one wants nothing to be different, not forward, not backward, not in all eternity' (*Ecce Homo*, 'Why I am So Clever', section 10). Fatalism is not a crushing weight if we 'incorporate' it, so that the force of past and present circumstances is balanced by the same force within ourselves. That there are no goals beyond the process of becoming, no reality above the world of appearance, is to be experienced as a precondition for true freedom.

> For what is freedom? That one has the will to assume responsibility for oneself. That one maintains the distance which separates us. That one becomes more indifferent to difficulties, hardships, privation, even to life itself. That one is prepared to sacrifice human beings for one's cause, not excluding oneself.
>
> (*Twilight of the Idols*, 'Skirmishes of An Untimely Man', section 38)

This responsibility for oneself has nothing in common with the moral responsibility which is a pretext for assigning blame and justifying punishment. It is a function of the strength of will whose typical expression is the ability to make and keep promises—primarily to oneself, not to others. To this 'free spirit', Nietzsche poses the demand: 'Become what you are!' This may suggest a Kantian or Schopenhauerian concept of intelligible character; yet Nietzsche has no belief in an intelligible self, located beyond the realm of becoming.

A REVALUATION OF VALUES

A constant theme in Nietzsche's thought is a radical revaluation of moral conceptions. In *Human, All Too Human*, he introduces a crucial distinction between two kinds of morality. One, the earliest source of these concepts, is the creation of ruling groups and individuals. 'Good and bad is for a long time the same thing as noble and base, master and slave. On the other hand, one does not regard the enemy as evil: he can requite. In Homer the Trojan and Greek are both good. It is not he who does us harm but who is contemptible who counts as bad' (*Human, All Too Human*, section 45). The second kind is that of the subjected and the powerless, the system of moral concepts that rationalizes their lack of power. Nietzsche returns to this theme in *Beyond Good and Evil;* but it is in *The Genealogy of Morals*—the last work he published, and one of his most daring—that the theory is fully elaborated. Each of its three long essays develops a central moral theme in terms of the concept of the will to power. There are two types of morality, 'master morality' and 'slave morality', though Nietzsche adds that 'at times they occur directly alongside each other—even in the same human being, within a *single* soul' (*Beyond Good and Evil*, section 260). In the first case, a ruling group posits its own sense of nobility and superiority as valuable and good. Here 'good' means 'noble', whereas 'bad' means 'common'. In the second case, the weak establish their own values,

in which strength is regarded as 'evil'. At the most fundamental level, the distinction is a 'physiological' one, between active impulses, spontaneous expressions of one's own energy, and the 'reactive' impulses, which by their nature are directed *against* something, an external danger. In fact, the noble are really not much interested in the ignoble; but the weak are preoccupied with the strong. Nietzsche uses the French word *ressentiment* for their attitude. 'The slave revolt in morality begins when *ressentiment* itself becomes creative and gives birth to values: the *ressentiment* of natures that are denied the true reaction, that of action, and compensate themselves with an imaginary revenge.' Christian morality is the most successful instance of such a system. But since the weak lack the power to take revenge directly, their revenge has to be mediated by a long and indirect process of deceitful conceptual manipulation which induces the strong to value respect and pity for the weak, and to condemn their own virtues.

Having laid out this schema, Nietzsche goes on to discuss the concept of responsibility, proposing a prehistory of harsh discipline out of which human beings have acquired the ability to maintain a commitment. Moral conscience is an internalized product of social custom. But like so much of morality, this turns against itself—for its final product is the person whose independence extends to the choice of goals. A further discussion of asceticism brings out the ambiguity which so often appears in Nietzsche's interpretation of moral phenomena. Asceticism can mean either of two very different things. Poverty, humility and chastity can be found in the lives of the great creative spirits; but here they are not valued for their own sakes, only as conditions enabling their activities to flourish most advantageously. This is very different from the attitude of the 'ascetic priest' who is really hostile towards life itself.

Nietzsche's thinking about society is really an extension of his attack on morality. He always emphasizes distinctions and 'order of rank'. He is hostile to socialism, as he understands it, understood as a levelling phenomenon, based on *ressentiment*. It must be remembered that his prototype of the socialist was not Karl Marx but rather Eugen Dühring—ironically, remembered later only as the target of Friedrich Engels's polemical work *Anti-Dühring*. Dühring traces the concept of justice back to the impulse towards revenge. He argues that revenge is given an impersonal and universal form by society, which establishes its own monopoly and takes vengeance out of the hands of individuals. Dühring was also a leading anti-Semite; and Nietzsche perceptively attributes this ideology ('the socialism of fools', as August Bebel called it) to the same underlying impulse. In one way, Nietzsche agrees with Dühring: that a formalist approach cannot account for the concept of justice. But he objects that Dühring has overlooked another class of drives: the active and creative ones. Systems of law are not set up by the weak for their common protection against the strong, or in order to satisfy their reactive feelings. Rather, they are instituted by individuals or groups who are 'active, strong, spontaneous, aggressive.'

CULTURE, ART AND MUSIC

Although its scholarship plays a secondary role to intuition, *The Birth of Tragedy* has been influential for its distinction between the 'Apollonian' and 'Dionysian' strains in

Greek culture. Nietzsche wanted to get away from the classical stereotype of Greek culture, to point to a darker, more violent and uncontrolled side. He traces the origins of tragedy to the trancelike state of the devotees of Dionysus, the god of death and rebirth. In their drunken ecstasies, the distinction between individual and world is eliminated; the truth of existence as a neverending process of creation and destruction is revealed. The original performers of tragedy, Nietzsche suggests, are the chorus, who translate this insight into the visible forms of the Apollonian style, modelled on dream images. The downfall of ancient tragedy, Nietzsche goes on to argue, was brought about by the ascendancy of rationalism, as represented in the figure of Socrates. Access to the sources of tragic wisdom is now blocked, and so the fruitful interaction of the Dionysian and Apollonian becomes impossible.

Having reached this conclusion, *The Birth of Tragedy* turns into an exercise in special pleading for the Wagnerian 'artwork of the future' as a vehicle for national revival. Nietzsche's ideas on aesthetics cannot be separated from the history of his involvement with Richard Wagner. By the time Nietzsche knew him, Wagner's early admiration for the humanistic materialism of Ludwig Feuerbach had given way to a Schopenhauerian pessimism, clearly visible in the operas of his *Ring* cycle, as in *The Birth of Tragedy*. Much of Wagner's influence was bad, especially a pompous tone and indulgence in personal polemic, both of which Nietzsche soon outgrew. In later years, Nietzsche clearly missed the camaraderie he had enjoyed in the Wagner circle, and wistful references to a group of 'new philosophers' appear in such later writings as *Beyond Good and Evil*. Wagner had argued for an art based on *pathos* rather than *ethos*, claiming Beethoven as both the paradigm case and his own immediate precursor. Many of Nietzsche's later reflections on style take the form of attacks on Wagner and a critique of the Wagnerian musical style which is often just a reaction against it. Music remained a preoccupation for Nietzsche, extending to several ventures in musical composition; in comparison, attention to the visual arts is notable by its absence. Perhaps surprisingly, Nietzsche took no interest in the operas of another winter resident of Genoa, Giuseppe Verdi; instead, he expressed admiration for Bizet's *Carmen*, much to the disgust of one reader, the unrepentant Wagnerian Bernard Shaw. Whether Nietzsche would have welcomed the *verismo* of the 1890s is unclear; his hostility to literary naturalism suggests not, and yet the abrupt termination of his development leaves such questions open.

More importantly, however, Nietzsche wanted to become known as a poet. His published works contain not only some light satirical verse but also more serious poetry, so-called 'dithyrambs', a term suggesting the choral hymns of Greek drama; *Thus Spoke Zarathustra* contains many instances of such a poetic prose.

Nietzsche wanted to be thought of as a 'good European', like Goethe, standing above national divisions. He often made derogatory comments about German culture, arguing that the political and military victories of the Prussian Empire had been achieved at the expense of its cultural values, and professing to think more highly of French culture for its *esprit*. The light style of French aphorists such as La Rochefoucauld and Chamfort appealed to him as a model which he emulated with some success. As a humorist he is less skilful, but *The Wagner Case* is a true satire, which conveys serious ideas with a light touch.

INTERPRETATIONS OF NIETZSCHE

Although his books sold poorly when first published, Nietzsche had become a well-known writer by the time he died. His unpublished writings, which included several completed works and a large collection of notebooks, remained under the control of his sister until her death in 1935. The history of their publication is a dramatic and in part scandalous story. Extensive notes from the last years of his work were brought out under the name *The Will to Power*, one of the many titles for works that Nietzsche projected. Whether he would ever have issued anything resembling this book is very doubtful indeed. The value of Nietzsche's notebooks has been the subject of a somewhat sterile controversy amongst commentators, with opinions ranging from summary dismissal to the equally exaggerated view that Nietzsche deliberately withheld his most important ideas. The sudden ending of his working life makes any claim as to what he would have later published speculative.

The control of Nietzsche's writings by his sister, until her death in 1935, had unfortunate effects. Nietzsche's reputation has suffered from her admiration for Adolf Hitler, an honoured guest at the Nietzsche Archiv in Weimar, where he was photographed contemplating a bust of the philosopher. More significantly, the works themselves were often tampered with, passages being removed or even altered to suit the purposes of Elisabeth Förster-Nietzsche. A scholarly edition, begun in the 1930s, was interrupted by the Second World War before it had progressed beyond the earliest writings; not until the 1960s was a collected edition of Nietzsche's writings begun again, under the editorship of two Italian scholars, Giorgio Colli and Mazzino Montinari. This work has continued steadily, to the great benefit of scholarship.

Nietzsche's influence has been strong on artists. Composers such as Richard Strauss and Delius set passages of *Thus Spoke Zarathustra* to music, and Nietzsche's life has inspired such works of fiction as Thomas Mann's *Doctor Faustus*, and was even the subject of a 1977 film entitled *Beyond Good and Evil*, described by one reviewer as 'somewhat disturbingly unpleasant'. In English-speaking countries, appreciation of Nietzsche was slow to come. His admirers were often eccentrics of an intellectual fringe, attracted by his scornful remarks about democracy, socialism and feminism. James Joyce's story 'A Painful Case' gives a cruelly accurate picture of the 'Nietzschean' of this period. A collected English edition of Nietzsche's published works was brought out by these enthusiasts shortly after his death. The translations are of variable quality, with *Thus Spoke Zarathustra* dutifully rendered in a distractingly pseudo-Biblical style. The later translations of Walter Kaufmann and R.J.Hollingdale, covering the same range, are far superior in both reliability and readability.

The 1960s saw a renewal of interest in Nietzsche and, in a slightly arbitrary way, three important works of that time, appearing in different languages yet in close succession, may be singled out. Martin Heidegger's two-volume *Nietzsche* (1961) was really the text of lectures delivered twenty years earlier. Nietzsche is here a figure of historical importance: the last western philosopher of the tradition beginning with Plato, who brings the glorification of the human will to its most explicit form, and whose conception of

nihilism captures accurately the essence of our own historical situation. Gilles Deleuze's *Nietzsche et philosophie* (1962, [7.34]) presents Nietzsche, in a version suited to the French philosophical scene of the time, as an opponent of Hegelian dialectical thought, a philosopher who replaces opposition and contradiction with difference. In Arthur Danto's *Nietzsche as Philosopher* (1965, [7.33]), Nietzsche is something of an analytic philosopher, interested in the problems that have concerned such philosophers: about truth and knowledge, morality and religion. More recently, the 'postmodern movement' in particular is strongly influenced by Nietzsche, as a radical thinker who subverts all established norms. Alexander Nehamas's widely read *Nietzsche: Life as Literature* (1985, [7.50]) is less unorthodox, yet it offers an original interpretation. Nehamas argues that Nietzsche recommends treating one's own life as something like a work of art. By reinterpreting the past, we can overcome the angry frustration of the will confronting the 'stone it cannot move'. All these versions of Nietzsche find support in his writings, as do yet other lines of interpretation. The days when Nietzsche could be put under the 'existentialist' heading are gone.

CONCLUSION

Few philosophers have been as little read during their working lifetimes as Nietzsche. During the century since the ending of his life as a thinker, his reputation has increased steadily. In many ways he seems a twentieth-century rather than nineteenth-century thinker, a prophet of modernism, and even of the social and political changes that began in 1914. He has also remained a source of controversy. Nietzsche has always aroused strong opinions, and been both praised and condemned for the wrong reasons. He was never an academic philosopher, and the entry of his thought into that philosophical sphere has good and bad aspects. Nietzsche would have welcomed the resulting attention, and especially the careful and scrupulous reading of his works. He would have been less pleased at contributing to the academic publishing industry, and at becoming something of an intellectual fashion in some circles. Yet the accessibility of his works ensures that a co-option is not to be looked for. Nietzsche remains the untimely thinker that he wanted to be.

CHAPTER 8
Dilthey

Michael Lessnoff

INTRODUCTION

Wilhelm Dilthey was born in 1833 near Wiesbaden, and thus lived through the period of Bismarck's creation of a unified German Empire by 'blood and iron'. These turbulent events, however, scarcely perturbed his career, which was wholly that of academic and scholar. For almost forty years he was to hold, successively, four university chairs of philosophy, the first as early as 1866, and culminating (from 1882 to 1905) in that of Berlin. Crucial to Dilthey's philosophical achievement, however, is the fact that he was not a philosopher only, but was equally interested, and distinguished, in the fields of cultural history and biography. Small wonder, then, that Dilthey is famous as the philosopher of the *'Geisteswissenschaften'*—the 'sciences of mind' or (as the term is often translated), the human sciences, or the human studies.

Indeed, the human mind and its products are the beginning and end, the alpha and omega, of Dilthey's philosophy; so much so that it is hardly possible, from his perspective, to draw a definite line between philosophy and psychology. Dilthey's philosophy is above all an epistemology, or theory of knowledge, and human knowledge arises in the human mind. Dilthey's viewpoint here can be interestingly compared with that of Hume. 'It is evident' wrote Hume in the Introduction to his great *Treatise,* 'that all sciences have a relation, greater or less, to human nature [and] are in some measure dependent on the science of MAN; since they lie under the cognisance of men, and are judged of by their powers and faculties'. With this proposition Dilthey was in full agreement, but thereafter the two philosophers sharply part company. Hume, starting from the premiss that all knowledge is a judgement of the human mind, and deducing therefrom the need to understand the operations of the human mind, ended up, somewhat paradoxically, with an account of the mind based on, and assimilated to, our (or its) knowledge of external nature, or natural science. Dilthey arrived at the opposite position. For him the mind is an autonomous realm, with its own principles of operation: correspondingly, knowledge of the mind is the discovery of these inherent principles, not a reading back of the way we know external nature, or natural science. The latter, indeed, are to be understood in a sense derivatively, as the mind's response to the non-mental: to nature as it impinges on human consciousness, and is grasped from the perspective of human life. Dilthey, who, it seems, took the primacy of the human mind more seriously than did Hume, was led by it to a philosophical and epistemological dualism, encapsulated by his famous distinction between two kinds of 'science' (knowledge): the *Geisteswissenschaften* (sciences of the mind, or of the human) and the *Naturwissenschaften* (sciences of nature).

Dilthey fully shared Hume's resolutely *empirical* epistemology (as Hume puts it, none of the sciences can go beyond experience). But he found many reasons to reject the Humean analysis of that experience—to reject, in other words, Hume's psychology, which was accepted by British empiricism generally. In this empiricism, the mind is viewed as the passive recipient of 'impressions' (which it copies in the form of 'ideas'), and as governed by mechanical laws of association of such ideas. To Dilthey (here, doubtless, the heir of Romanticism), this passive and mechanical picture of the mind is false: false, not only of human life as a whole, but even of the 'knowing subject'. (In a well known passage, Dilthey charged that 'no real blood' flows in the veins of the knowing subject 'fabricated' by Locke and Hume—and also Kant.) 'The core of what we call life is instinct, feeling, passions and volitions'; and this 'whole man' must be taken 'as the basis for exploring knowledge and its concepts' ([8.32], 13). Knowledge arises not just in the mind but in 'life'—the life of a feeling, willing, passionate human being. Indeed, the German words *erleben* and *Erlebnis*, used by Dilthey to express the idea of experience in the sense he considered fundamental, are derivatives of the word for life *(das Leben)*. In order to bring out the importance of this for Dilthey, *Erlebnis* is often translated into English as 'lived experience'.

As we saw, Dilthey's epistemology is dualistic, which means that there are two kinds of human experience—external and internal. The difference between them is fundamental. Internal knowledge is the subject's knowledge of itself—of its volitions and cognitions, its reasonings, decisions, values and goals, its mental states and acts in general. In the very having of these states, we are conscious of them, and know them *directly and immediately*. External knowledge also depends on the subjective states and acts of our minds, but it is not knowledge of them. Rather, we experience the external world in relation to our will, and especially in the frustration of our will, or as resistance. As Dilthey put it: 'In the experiences of frustration and resistance the presence of a force is given'—an external force, 'a force [that] is acting upon me' ([8.71], 58). Out of such experiences we construct our picture of the external world. This world, however, is known to us only by inference, not directly, our knowledge of the external world is thus a construction only. We do not know it as we know ourselves, it is fundamentally alien to us. In a way, Dilthey's view of our external knowledge is similar to Kant's: we cannot know things 'in themselves', but only as they appear to us. But he is more radically subjectivist than Kant—Dilthey refused to admit any *a priori* element in our knowledge of external appearances, ascribing it wholly to experience. And his view of our internal knowledge, our knowledge of our minds, is totally un-Kantian, for he held that in this realm we have direct knowledge, by experience, of a reality, of mental things-in-themselves. Kant's distinction between the noumenal (things in themselves) and the phenomenal (things as they appear to us) is replaced by a distinction between internal and external knowledge. It is obvious that this distinction is the root of Dilthey's famous distinction between two kinds of sciences—*Geisteswissenschaften* (sciences of mind or human sciences), and *Naturwissenschaften* (sciences of nature).

Dilthey's interest, as we saw, was primarily in the *Geisteswissenschaften:* he was interested in the *Naturwissenschaften* mainly for the sake of showing that, and how, the *Geisteswissenschaften* must differ from them. What then is the character of the natural sciences? The most fundamental point is that they deal with a world that is, as we have

seen, external and alien to us—a world which impinges on our experience, to be sure, but of whose ultimate, elemental nature we perforce remain ignorant because it is beyond our experience. In Dilthey's own words: our idea of nature is 'a mere shadow cast by a reality which remains hidden from us' ([8.32], 73). The picture of reality constructed by natural science therefore remains always 'hypothetical'—Dilthey referred, in this connection, to the 'groping' towards an adequate theory of nature which was initiated by the philosophers of ancient Greece (and is still continued by physics today) but which can never fully succeed, for 'it is not possible to demonstrate a definite inner objective structure of reality, such that remaining possible structures are excluded' ([8.32], 318). This does not mean, however, that Dilthey considered natural science to be useless or invalid. On the contrary, it is a highly appropriate and fruitful way of conceiving of external nature, from a human standpoint. Science conceptualizes nature in such a way as to facilitate its description in terms of precise, quantitative causal laws. It is thus concerned, in relation to all phenomena, with their typical and quantifiable aspects. In this sense, it is an abstraction from reality, but (in part due to the development of the experimental method) a hugely successful one, giving man mastery over nature: 'Once the causes of change in nature become accessible to our will we can produce the effects we want… A limitless prospect of extending our power over nature has opened up' ([8.36], no). But Dilthey insisted on the distinction between mastery over nature and knowledge of nature-as-such:

> if one…investigates nature insofar as it is the object of intelligence or insofar as it is interwoven with the will as end or means, it remains for the mind only what it is in the mind; whatever it might be in itself is entirely a matter of indifference here. It is enough that the mind can count on nature's lawfulness for the mind's activities in whatever way it encounters nature.
>
> ([8.32], 88)

But scientific laws of nature are also hypothetical, at best probable, never provable by experience; causal necessity (as Hume showed) is likewise a construction beyond experience. In a rather extreme formulation of his position, referring to the scientific world-picture of particles or atoms interacting with one another according to laws, Dilthey commented: 'neither atoms nor laws are real' ([8.32], 319).

Dilthey's conception of the natural sciences is based rather directly on his conception of external knowledge: his conception of the human sciences is based on his conception of internal knowledge, but less directly. Direct, internal knowledge is introspective knowledge, given in the experience of each individual person, of his or her own mental states and acts. Such knowledge is insufficient to constitute the human sciences in general: the latter depend on the presumption of a world of 'other minds' with basically similar contents to our own, revealed in words, deeds, and artefacts. In Dilthey's view, we make this presumption quite unproblematically, and he himself never treated it as a problem. The human world and its doings and makings (what Dilthey called the 'mind-affected world') indubitably exists, and provides the subject-matter of the human sciences. One should perhaps stress the phrase 'mind-*affected* world', in order to avoid misunderstanding of Dilthey's term *Geisteswissenschaften*. Human beings are, as Dilthey

often put it, psycho-physical complexes, not pure minds; and the human sciences deal with what he called *objectifications* of mind (sometimes he used the Hegelian phrase 'objective mind', though not with Hegel's meaning), i.e. the material world as formed by mental activity. Nevertheless the mental aspect is crucial.

The fundamental difference between the *Geisteswissenschaften* and the *Naturwissenschaften* is that, whereas in the latter we construct hypotheses about a world alien to us, in the former we deal with our own world, which we know directly. Thus, Dilthey thought, we can attain to a certainty in our knowledge which is beyond the reach of natural science, and which more than compensates for the much superior precision and generality of scientific laws. The latter can, in a sense, explain *(erklären)* but in a deeper sense the material world must always remain incomprehensible to us. But the human sciences deal with what we can and do understand *(verstehen)*. Dilthey's starting-point here is the individual's understanding of his or her own mental life, of the connections, for example, between one's desires, beliefs and actions. By analogy with this directly understood connection, one can understand the actions of others, as 'expressions' of mind. As Dilthey put it, we understand the mental life of others by re-living or re-experiencing *(nach-erlehen)* that experience. Actions are the most direct but not, Dilthey ultimately believed, the most important expressions of mind from the standpoint of the human sciences: most important are the permanent or lasting expressions—social institutions such as law and religion, human artefacts like the great cathedrals, and—perhaps most important of all—writings and works of art.

Dilthey insisted on a number of crucial differences between the human and natural, or mental and physical worlds. The human world is not a world of strict causal determinism, but one in which individuals are free (within limits) to pursue chosen ends: not a dead and meaningless world, but one in which values are created and recognized; a *historical* world which develops new forms through time, a creative world. Some of these differences are brought out in this graphic contrast of Dilthey's, between a waterfall (a natural phenomenon) and human speech:

> The waterfall is composed of homogeneous falling particles of water; but a single sentence, which is but a noise in the mouth, shakes the whole living society of a continent through a play of motives in absolutely individual units, none of which is comparable with the rest; so different is the ideal motive from any other kind of cause.
>
> ([8.71, 165)

Clearly, Dilthey implies that, if the sentence were treated as nothing more than a noise or succession of noises (which, from the standpoint of natural science, is precisely what it is), the effects produced would be utterly incomprehensible. To understand them, a completely different framework is necessary. Hence the need for a distinctive group of disciplines—the human sciences.

Dilthey's view of the relation between these disciplines differed at different stages of his career. At one, relatively early, stage he considered psychology to be fundamental (not, of course, a psychology modelled on natural science—on this, more below). Later, he came to the view that psychology is not self-sufficient but is as dependent on other

human sciences as they are on it: in particular, he was inclined to stress the importance, for all the human studies, of the interdependence of psychology and history. This, presumably, follows from the element of freedom and creativity which, Dilthey insisted, characterizes human life, making historical development an essential component of it, so that only in history are the potentialities of human psychology—of human nature—revealed. Similarly Dilthey points to a like interdependence between what he calls the two great classes of the human sciences, the historical and the systematic (or generalizing) sciences. Clearly, it was no part of Dilthey's intention to confine the human studies to particularities, and not infrequently he even referred to their discovery of laws (e.g. Grimm's Law in linguistics). Presumably, however, these laws or generalizations do not have the strict deterministic status that Dilthey attributed to the laws of natural science. Indeed, notwithstanding the generalizing aspect of the human sciences, Dilthey regarded their historical aspect as so fundamental that he referred to the epistemology of the human sciences which he sought to develop as a 'critique of historical reason'.

The idea of a 'critique of historical reason', with its obvious Kantian echoes, occurs in a work published in 1883, the *Einleitung in die Geisteswissenschaften (Introduction to the Human Sciences)*, and Dilthey's attempt to formulate it in a fully satisfactory form was to preoccupy him for the rest of his life. That much remained constant, but there are notable inconsistencies in the views Dilthey expressed over the years, and even in a single work. In the *Einleitung*, for example, the distinction between historical and systematic (generalizing) sciences is made, but it is doubtful whether it is actually used in Dilthey's survey and classification of the various 'special' human sciences. This is as follows. First, and most basic, are the sciences that deal with individual human beings—psychology and biography. (But biography is really an aspect of psychology—its historical aspect. It is also, in Dilthey's view, a main component of history proper.) In addition there are two kinds of social science (as we would now call them): sciences of systems of culture, and sciences of external organization of society. By 'systems of culture', Dilthey means complexes of interdependent actions devoted to some particular human purpose (examples are economics, religion and art); by 'external organization of society' he refers to the state and other associations, communities and relations of dominance and dependence (we might call these formal and informal social structures). Both types, Dilthey believed when he wrote the *Einleitung*, are dependent on psychology: their fundamental concepts are psychological concepts. Examples are the concepts of 'need, economy [i.e. thrift], work, value and the like', which are the foundation of political economy; or the 'instinct for sociability' which, Dilthey says, underlies human communal organization. Dilthey says that these concepts are, from the psychological point of view, 'second-rank concepts', i.e. non-basic; but he does not mean by this that they are simply deducible from the basic concepts and laws of individual psychology, as might have been asserted by, for example, John Stuart Mill—rather, they are concepts having to do with *interaction* between individuals, rather than concepts relating to individuals as such. (Dilthey is not very forthcoming about the precise nature of this relationship, which he describes as 'complicated', but he is emphatic that the attempt to elucidate it in terms of deduction and induction is useless—it rests on a wholly inappropriate model borrowed from natural science.)

The above schema may seem to be consistent with Dilthey's distinction between

historical and generalizing sciences, but this is actually doubtful, for in the *Einleitung* Dilthey gives prominence to—he repeats it several times—a different schema of classification involving not two but three elements, and which are said to distinguish not different types of human sciences but different types of *assertion* made within the human sciences generally. The three types of assertion are the particular or historical, the generalizing or theoretical, and—thirdly—the value-judging or prescriptive. It is clear that Dilthey considers that a single human science can, or should, contain all three. Perhaps the difference between historical versus generalizing sciences, and historical versus generalizing elements within a science, is a relatively minor discrepancy. However, the addition of evaluation or prescription is of the greatest importance. Dilthey was, indeed, insistent on the impossibility of separating factual statements and value-judgements in the historical and human sciences—though it is not clear in exactly what sense he believed the value-judgements involved to be scientific. On this puzzling aspect of Dilthey's thinking more will be said below. At any rate, it illustrates an important point, namely, that Dilthey's conception of the range of the human sciences is much wider than the word 'science' might suggest to English speakers. Thus, a list (in a later work by Dilthey) includes not only history, economics, jurisprudence, politics and psychology but also the study of religion, literature, poetry, architecture, music and 'philosophic world views and systems' ([8.36], 170). The earlier *Einleitung* mentions three 'special human sciences' which deserve some com-ment—philosophy, aesthetics and ethics.

Ethics, Dilthey insists, is one of the 'sciences of systems of culture', it is the study of social morality, rather than an 'imperative of personal life', or a 'theory of the righteous life' separate from sociology, a view of ethics that Dilthey attributes to Herbert Spencer. Dilthey's own view appears to be an example—even the most important example —of his general belief in the inseparability of fact and value in the human sciences. In the present case, it makes him an ethical empiricist. Put slightly differently, his view is that values, like knowledge, arise within the context of human life, in experience. We experience them in ourselves, and attribute them to others, as motives and as grounds of judgement. Dilthey rejects the notion of any 'transcendent' ground of moral judgement, higher than human life itself. Nor, it seems, does he wish to make any sharp, qualitative distinction between the 'third person' value-judgements that the human scientist may discover in his subject-matter, and 'first person' value-judgements that he makes *qua* human scientist. When we discuss (below) Dilthey's view of history and the great variability of historical forms, we shall see that his view of ethics gives rise to a serious problem of relativism.

Aesthetics and philosophy are said by Dilthey to be sciences that study, respectively, art and science. The two cases are of interest for different reasons. The case of aesthetics illustrates, again, Dilthey's contention that, in the human sciences, knowledge and evaluation are inseparable and equally indispensable elements. (Some scholars, indeed, believe that Dilthey's whole conception of the human sciences is rooted in his conception of aesthetics.) Equally important, art—especially literature—is for Dilthey itself an expression of the attempt to understand human life. Great art—great literature—by definition abounds in such understanding. This does not mean that art or literature is itself one of the human sciences, because it is not expressed in the systematic form of a

science. Nevertheless, art and the human sciences have in a sense a similar task. The human sciences have much to learn from the arts: ‘None of us would possess more than a meagre part of our present understanding of human conditions, if we had not become used to seeing through the poet’s eyes’ ([8.71], 233). Furthermore, aesthetics must have a special status among the human sciences, being the attempt to understand attempts to understand human life, or expressions thereof taking a particular form. It is not surprising, therefore, that Dilthey attached so much importance to aesthetics, and indeed contributed largely to it.

To call philosophy a human science, as Dilthey does, may seem surprising: it may seem that philosophy has as its subject-matter all reality, not only human activity. Consistently with this, there can of course be historical and other study of human philosophizing (again a field in which Dilthey was himself prominent)—but that is something different. The notion of philosophy as a human science is itself the staking out of a philosophical position, and follows from Dilthey’s oft-repeated, fundamental standpoint, the primacy of *life* (that is, human life). ‘Thought cannot go behind life.’ All speculation about reality, therefore, must actually concern itself with the way in which reality manifests itself in, or appears to, human life. In other words, genuine and valid philosophy must be epistemology or theory of knowledge. It is the attempt to achieve ‘universally valid knowledge’ about human knowing. ‘As such a theory of knowledge it is a science’ ([8.36], 125). Dilthey’s own philosophy certainly takes this form—so it is after all perhaps not so surprising to find him placing philosophy among the human sciences.

Implicit (and explicit) in Dilthey’s philosophical stance is a repudiation of rival philosophical positions. Dilthey’s is an embattled philosophy, and two of his main enemies are metaphysics and positivism. By metaphysics, Dilthey means abstract, schematic doctrines that claim to grasp the structure or essence of reality. Such doctrines he rejects as false to experience, over-simplifications that cannot capture reality’s variety and complexity, manifested especially in history. They are attempts to grasp the meaning of existence, but premature, one-sided attempts. On these grounds Dilthey repudiates, in the *Einleitung*, what he calls the philosophy of history as ‘not a true science’; he is here referring to theories which see history as the unfolding of some masterplan, aiming at some pre-given *telos*, and interpret historical particulars in the light of, hence in subordination to, the supposed plan or *telos*. To Dilthey this is a distortion that fails to take empirical history sufficiently seriously, in all its particularity and multiplicity. An obvious exemplar of this style of theorizing, which Dilthey repudiates, is Hegel. Another is Comte, who from Dilthey’s point of view is a double sinner, author of a metaphysical schematization of history (the Law of the Three Stages), and a metaphysic that is positivist to boot, that is, which sees the application of the positivist method of natural science to all disciplines, including the human sciences, as the historical *telos* (or at least the *telos* of human thought).

Another way in which Dilthey characterizes a metaphysical system is as a *Weltanschauung* or world-view taking, or claiming to take, philosophical form: ‘When a world-view has been raised to a level at which it is grasped and grounded conceptually and thus claims universal validity, we call it metaphysics’ ([8.32], 29). Hegel and Comte, in fact, can stand as exemplars of two of the three great ‘pure types’ of

Weltanschauungen that, Dilthey maintained, have constantly recurred in the history of human thought and culture, namely naturalism (or materialism), and objective idealism. These are two opposed monistic views of the world, the one interpreting everything in terms of matter, the other in terms of mind or spirit. Dilthey's third pure type of *Weltanschauung*, what he calls the idealism of freedom, is dualistic, seeing the mind as independent of physical causality (and superior to it). Dilthey himself might well appear to be an exponent of this third, dualistic *Weltanschauung*, but this categorization could hardly be acceptable to him, given his view that all the *Weltanschauungen* (including, explicitly, the idealism of freedom) are partial, incomplete views of reality, bound to encounter problems they cannot solve. However, metaphysical philosophy is only one of three spheres in which, Dilthey says, *Weltanschauungen* manifest themselves—the others are religion and art, especially 'poetry' (a term which for Dilthey applies to literature generally). Dilthey's view of the historical relation between religious and metaphysical *Weltanschauungen* is reminiscent of Comte: 'The mental law that general ideas can be completed only in conceptual thought…forces the religious *Weltanschauung* to become philosophical' wrote Dilthey in *Das Wesen der Philosophie* (*The Essence of Philosophy*, 1907) ([8.30, 51]) But of course he did not agree that Comte himself, in his positivistic philosophy, had got beyond metaphysics.

Dilthey's famous typology of world-views can stand as an exemplification of his own prescriptions for the carrying on of the human sciences. It results from a wide-ranging historical survey (in this case, of intellectual and cultural history); and it shows forth, in Dilthey's opinion, a constant of human psychology—for the drive to formulate world-views, in the attempt to make sense of the universe, is, he thinks, precisely that. It thus returns us to the twin premisses of Dilthey's philosophy of the human sciences—psychology and history. We must now examine his views on both of these in more detail.

DILTHEY'S VIEW OF PSYCHOLOGY

Dilthey's 'Ideas Concerning a Descriptive and Analytical Psychology' *(Ideen über eine Beschreibende und Zergliedende Psychologie)* was published in 1894. It is a major element of his *oeuvre*, and a major source of his views on the subject, but by no means the only one. It must be supplemented by later writings, including some not published in his lifetime.

In developing his ideas on psychology, Dilthey had to fight a war on three fronts, against Comtean positivism, British empiricism and German neo-Kantianism. Comte's positivism simply denied the validity of any independent science of psychology whatever, on the grounds of its unamenability to investigation by what Comte took to be the necessary method of all science, the 'positive' method of external observation. The neo-Kantians, such as Heinrich Rickert (their most prominent spokesman), drew a sharp distinction between the historical or cultural sciences, which focus on the particular, and natural sciences, which seek general laws. They placed psychology in the latter category, at the same time denying that it could give knowledge of the transcendent 'noumenal' self, or of the realm of *Geist* or spirit. As for the British empiricists, they took psychology to be a natural science like any other—on this point they agreed with the neo-Kantians,

but differed as to whether there is some deeper spiritual reality undiscoverable by natural scientific method. Dilthey took psychology to be a science, but not a natural science, a science precisely of *Geist*.

In the *Ideen*, Dilthey offers two somewhat different arguments against a psychology based on natural scientific method, a project which he often refers to as 'explanatory psychology'. Natural science is hypothetical. More precisely, it breaks reality down into hypothetical elements, postulates laws connecting them and thus explains phenomena. Such a manner of explanation is called by Dilthey 'constructive'—it constructs a picture of reality out of hypothetical elements linked by hypothetical relations. This method works very well in certain areas, notably those dealing with phenomena that are precisely measurable and subject to controlled experiment. Neither of these conditions obtains in psychology. The result is a chaos of competing theories: 'To each group of hypotheses is opposed yet a dozen more… One sees absolutely nothing which can decide the issue of the struggle' ([8.31], 26). Nor can one hope to improve matters by recourse to areas where the natural scientific method is applicable, such as physiology: 'Consciousness cannot go behind itself ([8.31], 75): in other words, the conscious cannot be explained by the non-conscious. Thus, Dilthey concludes, 'Explanatory psychology is not only now unable, but will never be able to elaborate an objective knowledge of the nexus of psychic phenomena'. It is, Dilthey says, 'bankrupt' ([8.31], 49). Fortunately, however, there is no need, in psychology, to postulate hypothetical entities governed by hypothetical laws, and then construct a picture of reality—for in psychology knowledge of reality is given to us directly. Such a psychology will, however, not be explanatory and constructive, but descriptive and analytic.

What exactly does Dilthey mean by a descriptive and analytic psychology? The crucial point, stressed over and over again by Dilthey, is that apprehension of the psychological is the directly lived inner cognition of systematically connected elements constituting a functional unity or whole. It is not simply the individual elements but equally their unity and connectedness that are directly given to us. To designate this unity or connectedness Dilthey used the word *Zusammenhang* (literally, a hanging-together). The word is important, for two reasons: firstly, because it is perhaps the most characteristic and frequently used term in all of Dilthey's writings; secondly, because its translation into English is neither straightforward nor uniform, since it may refer either to a totality of parts (whole, structure) or to connections between elements. This ambiguity is of some consequence in Dilthey's thinking, and can be illustrated by considering the following passages in the *'Ideen'* which show how the term functions in his concept of a descriptive and analytic psychology:

> Hypotheses do not at all play the same role in psychology as in the study of nature. In the latter, all connectedness *[Zusammenhang]* is obtained by means of the formation of hypotheses; in psychology it is precisely the connectedness which is originally given in lived experience.
>
> ([8.31], 28)

> By descriptive psychology I understand the presentation of the components and continua which one finds uniformly throughout all developed modes of human

> psychic life, where the components form a unique nexus which is neither added nor deduced, but rather is concretely lived. This psychology is thus the description and analysis of a nexus which is originally given as life itself… Every connection *[Zusammenhang]* utilized by it can be verified unequivocally by inner perception, and from the fact that each such ensemble can be shown to be a member of a larger whole, not as a result of deduction, but as given originally in life.
>
> ([8.31], 35)

> For psychology the functional system *[Zusammenhang]* is *given from within* by lived experience. Every particular psychological cognition is only an *analysis* of this nexus… Psychic life is a functional system [whose] component parts…exist within individual systems of a particular kind, [which are the source of] problems to psychology. These problems can be resolved only by means of analysis: descriptive psychology must be at the same time an analytic psychology… Analysis separates the component parts which are united in reality.
>
> ([8.31], 56–7; emphases in original)

In brief, Dilthey, in the course of these three passages, moves from asserting the experienced connectedness of psychological items, to asserting that these connections constitute larger wholes or systems, also directly experienced (and the word *Zusammenhang*, translated in the first passage as connectedness, refers in the third passage to the total functional system). Thus Dilthey arrives at his conclusion that psychology should take the form of analysing the elements of given psychic wholes.

The ambiguity of the word *Zusammenhang* is significant primarily because of its bearing on two concepts that are central to Dilthey's philosophy of the human sciences, namely understanding *(Verstehen)* and meaning *(Sinn, Bedeutung)*. Do 'understanding' and 'meaning' turn on relations between connected elements or on relations between parts and wholes? Dilthey gives both answers, and the importance of this will become apparent for the philosophy of social science as elaborated in his later work. But the point is already prefigured in his writing on psychology. Here is one account given by Dilthey of his favoured method of psychological analysis. A state of human consciousness characteristically involves, he says, three elements or modes, namely, representations (of the world), feelings and volitions. Dilthey stresses the interrelation of all three, but especially the role of volitions, in producing action. Analysis, then, must 'define the concepts of goal-positing, motive, relation between ends and means, choice and preference and unravel the relations which exist among these' ([8.31], 70). It is, in other words, a process of relating actions and their outcomes to the motives, goals and volitions which produce them—and corresponds to the (or a) definition of *Verstehen* (understanding) later given by Dilthey: 'Understanding penetrates the observable facts of human history to reach what is not accessible to the senses and yet affects external facts'—for example, values and purposes ([8.36], 172–3) But more often, in the *Ideen*, Dilthey relates *Verstehen* not to such connections but to the grasping of wholes. For example:

> The processes *of the whole psyche* operate together in [lived] experience… In the lived experience a particular occurrence is supported by the totality of psychic life, and the whole of psychic life belongs to immediate experience. The latter already determines the nature of our *understanding (Verstehen)* of ourselves and others… In understanding we proceed from the coherent whole which is livingly given to us in order to make the particular intelligible to us [emphases in original]… Precisely the fact that we live with the consciousness of the coherent whole, makes it possible for us to understand a particular sentence, gesture, or action. All psychological thought preserves this fundamental feature, that the apprehension of the whole makes possible and determines the interpretation of particulars.
>
> ([8–31], 55)

What exactly does Dilthey have in mind when he refers to a psychological (psychic) whole? The answer is twofold, but both aspects relate to the life of the human individual. One is what might be called the individual's personality-structure *(Zusammenhang des Seelenlebens);* the individual is a psychic unity or (in another of Dilthey's phrases) *erworbener seelischer Zusammenhang* (translatable as 'acquired psychic nexus'). This phrase implies the unification of an individual's experience, representations, feelings, purposes and values into a whole that makes one the person one is, and makes one pursue the goals that one pursues. Thus, when Dilthey talks of a 'descriptive and analytic' psychology, he means the description, analysis and classification of such structures. Such a study should cover the entire range of human life, 'from its more humble to its highest possibilities'. But Dilthey was especially interested in the latter—in 'religious genius, historical heroes, creative artists'. Since such outstanding figures are 'motive forces in history and society', psychology 'will become the instrument of the historian, the economist, the politician' ([8.31], 40–1).

In referring to the acquired psychic nexus, Dilthey refers to the enduring values, habits of will, and dominant goals that make it up. But values and goals generate action, and therefore change. Thus the psychic structure is inherently dynamic. It develops over an individual's life. And the individual life is also, according to Dilthey, a systematically connected whole—one that develops through time, and can be understood. The writing of a biography is the attempt at such a coherent understanding of an individual life (autobiography is the individual's attempt at such understanding of his or her own life). Dilthey frequently applies the concept of *meaning* to this understanding of human life; but an ambiguity is detectable, similar to that mentioned above in relation to understanding itself. Is this 'meaning' the relation between an action and its purpose, goal or motive? or does it lie in the coherent relation of parts of a whole (life)? Again, Dilthey gives (or at least suggests) both answers. Thus, his remark that the meaning of a life is the relation between its outer events and 'something inner' ([8.35], 91) suggests the former. But predominantly the latter interpretation is stressed, as in this typical passage:

> What is it that, in the contemplation of one's life, links the parts into a whole and thus makes it comprehensible? It is the fact that understanding involves…

> the categories of…value, purpose and meaning… Looking back at the past in memory we see, in terms of the category of meaning, how the parts of a life are linked together.
>
> ([8.35], 103)

Despite the importance of the concepts of value and purpose, 'only the category of meaning', Dilthey insists, expresses 'the connectedness of life' ([8.35], 104). Again the grasping of meaning is the grasping of a *Zusammenhang*.

The quotation above is also significant for another reason, namely, the reference to memory, for this relates to one of the most characteristic and suggestive, and possibly influential, elements in all of Dilthey's work, namely, the *temporality* of life. To say that a human life is lived through a duration of time may seem banal; but Dilthey was at pains to stress the difference between *lived* time and the abstract time of (say) the physical scientist. Lived time 'is not just a line consisting of parts of equal value… Nowhere [in such a linear continuum] is there anything which "is"'. Indeed, the character of lived time is paradoxical, in that we live *always* in the present, but the present *includes* the past, through memory, and the future, through our plans, hopes and fears.

> Concrete time consists…of the uninterrupted progress of the present, what was present becoming the past and the future becoming the present, [that is], the becoming present of that which a moment ago we still expected, wanted or feared…this is the character of real time… The present is always where we live, strive and remember: in brief, experience the fullness of our reality, [but] the continued effectiveness of the past as a power in the present, gives to what is remembered a peculiar characteristic of 'being present'.
>
> ([8.35], 98–9)

In these passages, where human life is characterized as a continually moving present which contains a (likewise continually moving) past and future, Dilthey is referring to the structure of the life of an individual: but he could equally well be referring to his view of history.

PSYCHOLOGY, HISTORY AND THE HUMAN SCIENCES

Many commentators on Dilthey have remarked on a pronounced change in his thinking about the human sciences in the years after he wrote the *Ideen,* and especially in the last period of his life. In brief, the change discerned is a down-grading of individual psychology, and a corresponding turn to emphasizing the importance of concrete, objective manifestations ('expressions') of mind in history and society, and the interpretation of such expressions. Michael Ermarth, for example, in his *Wilhelm Dilthey: The Critique of Historical Reason,* speaks of Dilthey's thought moving away from subjective acts of experience to intersubjective and mediated contexts of experience, or in other words from the psychological to the cultural and historical ([8.65], 232). There is undeniably much truth in this perception of the trend of Dilthey's thought. He certainly

abandoned his view of psychology as the very foundation of the human sciences, and he at least wavered of one of the cornerstones of his early thinking, namely the certainty of the knowledge afforded by introspection of lived experience. On the other hand, the continuities between the earlier and later phases of his think-ing should not be overlooked. For example, already in the *Ideen,* Dilthey clearly stated the need to study not just the individual psyche but all of human history and culture, in order to arrive at a full description, classification and analysis of the mental. The following passage in the *Ideen* puts the point quite bluntly: 'Man does not apprehend what he is by musing over himself, nor by doing psychological experiments, but rather by history' ([8.31], 62). To understand human psychology, also, we must study the mind's *creations*—in literature and art, but also 'in language, myth, religious ritual, customs, law, and in the external organization of society'—in brief, in all historical processes which are products of the human mind. Recourse to 'the objective products of psychic life' must supplement perception of inner states, is indeed, Dilthey says, of the greatest importance: 'it is an inestimable advantage to have before us stable and enduring formations, to which observation and analysis can always return' ([8.31],81). As for methods, we learn about 'inner processes' of mental life by recourse to such evidence as diaries and letters, the reports of poets on poetical creation and the lives of religious geniuses, such as St Francis, St Bernard and Luther.

It is clear, then, that the theory of mental expressions—certainly the most celebrated idea in Dilthey's 'critique of historical reason', and probably his most admired contribution to philosophy—was already present *in nuce* at a relatively early stage, even if it had to await its fullest and most systematic formulation till much later. And the references (above) to Sts Francis and Bernard, and to Martin Luther, serve as a reminder of another continuity between the earlier and the later work, namely, the pivotal role of biography. Biographies are both source and subject-matter for psychology and history equally. Biography and history, of course, cannot be simply equated, as Dilthey was well aware—he never reduced history to the doings of 'great men', however much he stressed their historical importance. Rather, the point is what might be called the structural homology between history and biography. The individual human life, Dilthey says, is the 'germinal cell' of history, in which 'the specific historical categories arise' ([8.35], 73). The individual life, as we noted above, 'is present in the memory' of the individual; thus 'the sequence of a life is held together by the consciousness of identity…the discrete is linked into continuity'. Likewise, history

> is only possible…through the reconstruction of the course of events in a memory which reproduces…the system of connections and the stages of its development. What memory accomplishes when it surveys the course of a life is achieved in history by linking together the expressions of life which have become part of the objective mind, according to their temporal and dynamic relationships. This is history.
>
> ([8.35], 89)

Just as the individual life is lived always in the present, but a present which includes (memories of) the past, so the present of collective humanity also includes its past—is

historical:

> We are hourly surrounded by the products of history. Whatever characteristics the mind puts into expressions of life are tomorrow, if they persist, history. As time marches on we are surrounded by Roman ruins, cathedrals, and the summer castles of autocrats. History is not something separated from life or divided from the present by distance in time.
>
> ([8.35], 124)

And in another striking passage, Dilthey suggests that the role played by memory in the life of the individual is played, in that of 'nations, communities, of mankind itself by the historian. But for his efforts, their past would mean as little to them as would his to a person without a memory. 'The ruins, the remnants of things past, the expressions of mind in deeds, words, sounds and pictures, of souls who have long since ceased to be' surround us but are in themselves dead and meaningless. The historian 'stands in the midst' of these things: his task is to 'conjure up' the past, by 'interpretation of the remnants that remain' ([8.35], 139). He provides human communities with an essential part of human life.

It may seem from the above quotations as if Dilthey, *qua* historian, was a believer in what could be called 'collective minds' of human communities such as nations. This, however, is at best an oversimplification, at worst misleading. Certainly he accepted the reality of peoples or nations *(Völker)* as significant social and historical entities: this is explicit, for example, in the *Introduction to the Human Sciences* ([8.32], 100). But in that book he immediately went on to reject as mystical any suggestion that these entities are supra-individual organisms, or possess a supra-individual 'folk soul' or 'folk spirit' *(Volksgeist)*. Such notions were unacceptable from Dilthey's fundamentally empirical standpoint: empirically, the only bearer of mind is the individual. The relation between the individual and collective entities like nations was therefore a problem that Dilthey took seriously. He later posed it as follows:

> The question now arises, how can a system which is not produced as such in one mind, and which is therefore not directly experienced nor can be reduced to the lived experience of one person, take shape as a system in the historian's mind from the expressions of persons and statements about them? This presupposes that logical subjects can be formed which are not psychological subjects. There must be a means of delimiting them, there must be a justification for conceiving them as units… And here arises the great problem.
>
> ([8.71], 289)

Dilthey's solution to the problem was to identify the nation or people with the national consciousness of individuals: 'It is…the consciousness of belonging together, of nationality and national feeling, on which the unity of the subject finally rests.' This consciousness is firmly rooted by Dilthey in individual psychology: 'The consciousness of belonging together is conditioned by the same elements that assert themselves in the individual's consciousness of himself ([8.35], 152–3). Yet the consciousness of

belonging together creates a collective entity, which in turn influences the consciousness of individuals: 'The common experiences of a nation, common purposes and memories are real. They are the source of the communally determined purposes of individuals.' It is a commonplace, Dilthey says, that only individuals can experience the satisfaction of realized purposes: yet such satisfaction may come from identification with one's nation. 'An individual wills national ends as his own, experiences the nation's experiences as his own, has memories of such experiences as belonging to himself, is filled with them and carried along by them' ([8.71], 294). A nation, therefore, is not only a reality but a distinctive unity: 'Nations are often relatively self-contained and because of this have their own horizon' ([8.35], 130). By this Dilthey means that they have a characteristic conception of reality and system of values. They are not only (through, for example, state organization) historical agents, but appropriate contexts for the interpretation of individual acts and expressions, which they condition. In this, non-metaphysical sense, the term *Volksgeist* can be accepted.

Much the same may be said about the term *Zeitgeist* (or *Geist des Zeitalters*). The *Zeitalter* (epoch, era or historical period) is in Dilthey's thought an important and undoubted reality, often indeed referred to alongside, and in similar terms to, the people or nation, as a 'structural system' or 'unit of the world of mind'. Dilthey puts it thus:

> The common practices of an epoch become the norm for the activities of individuals who live in it. The society of an epoch has a pattern of interactions which has uniform features. There is an inner affinity in the comprehension of objects. The ways of feeling, the emotions and the impulses which arise from them, are similar to each other. The will, too, chooses uniform goals, strives for related goods… It is the task of historical analysis to discover the consensus which governs the concrete purposes, values and ways of thought of a period.
>
> ([8.36], 198)

The *Zeitgeist* is, once again, an appropriate context for the understanding of such expressions, and vice versa. Thus (to cite an example given by Dilthey), the historian can use the civil law of the 'age of Frederick' to 'understand the spirit of that age; he goes back from the laws to the intentions of the legislature and from there back to the spirit from which they arose', or in other words 'the social values, purposes [etc.] present at a certain time and place and which [thus] expressed themselves' ([8.35], 76). Another example, developed at some length by Dilthey, is Teutonic society in the time of Caesar and Tacitus:

> Here, as in every later period, we find economic life, state and law linked to language, myth, religiousness and poetry… Thus heroic poetry arose from the warlike spirit in the Teutonic age of Tacitus, and this poetry invigorated the warlike spirit. From this same warlike spirit inhumanity arose in the religious sphere, as in the sacrifice of prisoners and the hanging up of their corpses in sacred places. The same spirit then affected the position of the god of war in the world of the gods.
>
> ([8.35], 150–1)

It must be stressed, once again, that for Dilthey the *Zeitgeist* is an empirical generalization, not a deterministic force—for if it were the latter there would, presumably, be no change—no history. Yet historicity is, as we know, central to Dilthey's vision of human life. Thus every 'historical configuration' is 'ephemeral'. But historical change is of course neither random nor total. According to Dilthey it arises (in part at least) from the perceived imperfection inevitable in every age, from man's 'unfulfilled longing' (due, for example, to the social inequalities—'impoverishment of existence' and 'servitude'—said by Dilthey to spring from the power relations that are inseparable from human social life). Thus successive ages are linked in the following way:

> Every age refers back to the preceding one, for the forces developed in the latter continue to be active in it; at the same time it already contains the strivings and creative activities which prepare for the succeeding age. As it arose from the insufficiency of the preceding one so it bears in itself the limits, tension, sufferings, which prepare for the next age.
>
> ([8–35], 156)

Thus Dilthey integrates his conception of the *Zeitgeist* into his concep-tion of historical change in a way that allows for individual freedom and creativity. Although we quoted Dilthey (above) on the historian's task of discovering 'the consensus which governs' the values and conceptions of an epoch, 'governs' is really too strong a word; for almost at once Dilthey adds that the historian must assess 'what the individual has achieved within this context, *and how far his vision and activity may have extended beyond it*' ([8.36], 198, emphases added). History is not a realm governed by scientific causality but of 'action and reaction'. The coherences and structures that the historian seeks and discovers are real but 'can never bind or determine what is new, or may appear in the future'. Historical events and changes can be understood after the event, but not predicted in advance. As Dilthey sums it up, 'History does not cause, it creates'. He adds: 'It creates because the structure of life is at work in the acts of knowing, evaluating, setting of goals, and striving for ends' ([8.65], 308). The concepts of all the human sciences (not only history) reflect this fact. Despite the limits placed on human freedom by the causal necessities of nature (within which humanity exists), the freedom due to the human element is real:

> Surrounded though it is by that structure of objective necessity which nature consists of, freedom flashes forth at innumerable points… Here the actions of the will—in contrast with the mechanical processes of change in nature (which already contains from the start everything which ensues later)—really produce something and achieve true development both in the individual and in humanity as a whole.
>
> ([8.32], 79)

DILTHEY'S HERMENEUTIC TURN

In only the last decade or so of his life, Dilthey elaborated what is probably now the most celebrated aspect of his philosophy of the human sciences, or critique of historical reason—namely, hermeneutics. Not that hermeneutics was by any means a new interest for Dilthey—his first major work, indeed, was a notable biography of Schleiermacher (the 'father of modern hermeneutics'), so that the late 'turn to hermeneutics' was for Dilthey a return to scholarly beginnings. Nevertheless, the innovation was marked, for only in his late phase did hermeneutics become for Dilthey the centre of his philosophy rather than an object of historical study.

Dilthey defined hermeneutics as the 'science' of 'the interpretation of the written records of human existence' ([8.36], 228). Thus, his hermeneutic methodology of the human sciences gives pride of place to a science of linguistic interpretation. This is not to say that Dilthey wished these sciences to take as their object of study only written documents: the latter are only one (though very important) category of the 'expressions of mind' which form their subject-matter. Nevertheless, the hermeneutic emphasis does put a particular slant on the mode of interpreting these expressions: they are to be interpreted, so to say, 'as if they were verbal expressions. This has significant implications for some of the central concepts of Dilthey's philosophy of the human sciences—notably understanding *(Verstehen)* and meaning *(Sinn, Bedeutung)*.

Some of these implications emerge from a consideration of the two typical concerns of hermeneutic technique as it developed prior to Schleiermacher and Dilthey (according to the Dilthey scholar Use Bulhoff). One (dubbed 'philological') was concerned to restore corrupt texts (e.g. classical texts) in which errors had accumulated through repeated copying. Another (called 'theological') aimed at grasping the 'true meaning' of Biblical texts ([8.60], 56). Different though these are, both make sense only given a presumption of *unity* or *coherence* in the texts handled. Errors in corrupt texts become apparent through their failure to 'fit', to 'make sense', in terms of the text as a whole—correction restores the 'fit'; similarly, the exegesis of biblical texts proceeded on the assumption that they are mutually coherent and consistent—it might be described as the enterprise of demonstrating their coherence or unity. Dilthey's hermeneutic methodology of the human sciences bears the marks of this ancestry, in its preoccupation with relations of coherence between *wholes* and *parts*. To be sure, we have already seen a similar preoccupation in Dilthey's earlier work; however, some problematic aspects thereof are thrown into relief by the later hermeneutic emphasis.

Perhaps the best-known element of hermeneutic methodology is the so-called 'hermeneutic circle'. Here is how Dilthey at one point defined it: 'The general difficulty of all interpretation [is that] the whole of a work must be understood from individual words and their combinations, but full understanding of an individual part presupposes understanding of the whole' ([8.36], 259). Another passage elaborates the point. In hermeneutics,

> understanding must try to link words into meaning and the meaning of the parts

> into the structure of the whole given in the sequence of words. Every word is both determined and undetermined. It contains a range of [possible] meanings… In the same way…the whole, which is made up of sentences, is ambiguous within limits, and must be determined from the whole [*sic*—error for parts?]. This determining of determinate-indeterminate particulars is characteristic of hermeneutics.
>
> ([8.36], 231)

In brief, hermeneutics is a procedure in which the parts and whole of a text mutually clarify each other, on the presumption that the whole is a meaningfully coherent relation of parts.

To repeat, this is the *model* for Dilthey's late philosophy of the human sciences which, however, embraces not just texts but also non-linguistic expressions of the human mind. Thus extended, the analogy gives rise to certain problems (or at least issues), of which three sources may be mentioned, (1) Not all 'expressions' express meanings in the same sense as do words and texts; (2) Dilthey applies (or seems to apply) the hermeneutic methodology to a range of expressions much wider than the purely linguistic, but not to *all* expressions; (3) in applying the hermeneutic analogy to the human sciences generally, rather than the exegesis of texts narrowly, Dilthey greatly expands the range of 'wholes' (and parts) relevant to interpretation, understanding and the elucidation of meaning.

Regarding the first of the three points above, Dilthey himself explicitly distinguished several different sorts of 'expressions' relevant to the human sciences. Particularly germane is the distinction between *actions* and so-called *Erlebnisausdrücke* ('expressions of experience'), which are verbal, usually written, accounts. The former are 'expressions' in the sense that they reflect purposes, the pursuit of goals etc., and are in this sense meaningful or have a meaning ([8.97], 65–6). Verbal utterances are no doubt likewise purposeful acts, but they also have a meaning in another sense, that is, words conventionally signify some semantic content. It therefore seems as if the fundamental, or most general, sense in which expressions of mind have a meaning which can be grasped or understood is not the same as the straightforwardly hermeneutic sense. This introduces some ambiguities into Dilthey's terminology in that, alongside the hermeneutic version of meaning and understanding, he continued to make use of the 'pre-hermeneutic' sense. Thus, he remarks on 'the fact that inner states find outward expressions, and that the latter can be understood by going back to the former' (this is the business of the human sciences) ([8.35], 75). But he adds that there are two ways in which 'an outer manifestation is the expression of an inner state, namely, 'by means of an artificial convention' [e.g. as in language], or 'by a natural relationship between expression and what is expressed' (as in non-linguistic expressions such as actions which express, and can be understood as expressing, a purpose). It seems that Dilthey is reluctant to make any sharp distinction between the two cases.

It is arguable that the blurring of this distinction encouraged Dilthey to apply his hermeneutic methodology to a wider range of 'expressions' than may be justified. But how widely did he wish to apply it? It appears (though it is difficult to be certain on this point) that the hermeneutic methodology is *not* coextensive with all acts of understanding

of expressions. Dilthey makes a distinction between 'elementary' and 'higher' understanding. The distinction is not particularly clear, but one aspect of it seems to be that 'elementary' understanding is understanding of a *single* expression, such as 'picking up an object, letting a hammer drop, cutting wood with a saw'—actions which 'indicate the presence of certain purposes' ([8.36], 220). All that is involved in this understanding is 'to spell out the mental content' which constitutes the goal of the action. The implication is that 'higher understanding' goes beyond this, and involves the placing of actions in a wider context. It appears to be Dilthey's view that the hermeneutic methodology is a means to 'higher understanding', and is required, or appropriate, where the understanding of expressions is not straight-forward but problematic ([8.97], 101). Clearly this is liable to be the case in relation to textual records emanating from distant periods or cultures; but it is equally likely to be true wherever 'understanding' has to go beyond the everyday intercourse of participants in a common culture—in other words, to embrace the understanding required of historians and social scientists. It looks, therefore, as if Dilthey considered the range of the hermeneutic methodology to be more or less coextensive with that of the human sciences. It is to apply, that is, to actions (as studied by historians and social scientists), as well as to written material.

From Dilthey's assimilation of these different kinds of expressions arise some problematic implications. One is that he is led, quite explicitly, to detach the understanding of expressions, and their meaning, from the goals and intentions of agents ([8.35], 163). For this there seem to be two slightly different reasons, both however derived from the hermeneutic perspective. One is that the meaning of language (which is the focus of hermeneutic interpretation) is a matter of public conventions, rather than the intentions of language users. The other is that, as we saw, the fundamental tool of hermeneutic interpretation is the 'hermeneutic circle', which rests understanding and the grasping of meaning on the part-whole relation, on the presumption that one is dealing with a coherent whole made up of consistently related parts. Dilthey applies this idea (or analogy) quite universally to the categories of understanding and meaning in the human sciences. For example: 'Meaning means nothing except belonging to a whole' ([8.36], 233); 'The category of meaning designates the relationship, inherent in life, of parts of a life to the whole' ([8.36], 235). Dilthey makes it clear that these definitions follow from an analogy between linguistic meaning and the understanding of life in passages such as the following:

> As words have a meaning *(Bedeutung)* by which they designate something…so on the basis of the determined-undetermined *(bestimmt-unbestimmten)* meaning of the parts of life, its structure *(Zusammenhang)* can be figured out. Meaning is the special kind of relationship which the parts of life have to life as a whole.
>
> ([8.60], 121)

In detaching the meaning and understanding of expressions from the intentions of agents, Dilthey appears to risk an incoherence in his philosophy. For he never abandoned his original insight, on which he based his distinction between natural and human sciences, namely that

> we understand others, their doings and their products in fundamentally the same way as we understand our own. Thus: we cannot understand ourselves and others except by projecting what we have actually experienced into every expression of our own and others' lives. So man becomes the subject-matter of the human studies only when we relate experience, expression and understanding to each other.
>
> ([8.36], 176)

This concept of understanding surely cannot be detached from agents' goals and intentions—rather it seems to require our empathizing with them.

Displacement of understanding of actions and their meaning from agents' intentions to the place of the action in a larger whole raises another problem: how to specify the relevant whole. In the strictly or narrowly hermeneutic case, this problem may not appear to be insoluble; but when a hermeneutic approach is applied to history and the human sciences in general, it becomes acute. We have already taken note (above) of Dilthey's predilection for treating the individual human life as a meaningful unity, in terms of which the meanings of its parts are to be discerned. A similar approach is applied to historical events. But as we shall now see, this—and especially the latter—appears to introduce an intrinsic uncertainty or relativism into Dilthey's central concept of meaning (and hence of understanding, which is the grasping of meaning). Dilthey writes:

> The category of meaning designates the relationship, inherent in life, of parts of a life to the whole. The connections are only established by memory, through which we survey our past… But in what does the particular kind of relationship of parts to a whole in life consist? It is a relationship which is never quite complete. One would have to wait for the end of a life, for only at the hour of death could one survey the whole from which the relationship between the parts could be ascertained. One would have to wait for the end of history to have all the material necessary to determine its meaning… Our view of the meaning of life changes constantly. Every plan for your life expresses a view of the meaning of life.
>
> ([8.36], 235–6)

Some obvious problems arise from this passage. So far as the individual life is concerned, Dilthey vacillates between two points of view: namely, that a human life is a natural unity stretching from birth to death, from which the meaning of its parts derives; and that it is a continually developing and changing unity, with corresponding change in the meaning of parts. Something similar applies to history. 'One would have to wait for the end of history to have all the material necessary to determine its meaning.' But Dilthey elsewhere has explicitly stated that history as a whole has no single meaning, no over-arching *telos* or goal ([8.71], 303). Where then can the historian find the unity needed to discern meaning and permit understanding? Does he or she need to find such a unity? Undoubtedly, historical development continually reveals new connections (as Dilthey might have put it, *Zusammenhänge*) which call for reinterpretation of past events, and the historian's function is a continual analysis and re-analysis of these connections. But a

Zusammenhang, in the sense of structured connection, is not a definable *whole* made up of definable parts. Or to put it another way, to ask the historian to convert a pattern of connections into a meaning-conferring whole seems to give him or her a great deal of latitude in the assignment of meaning. One has to wonder if this is any longer 'science'.

HISTORICISM AND THE PROBLEM OF RELATIVISM: DILTHEY'S SOLUTION

There is one answer given by Dilthey to this problem of the definition of historical wholes, which is of particular interest because, in so far as it does help to solve that particular problem, it immediately raises another. We noted above the importance attached by Dilthey to the concept of the historical period *(Zeitalter)* and its unifying 'spirit': we must now note his view that this constitutes a whole that confers meaning on its parts:

> Everything in an age derives its meaning from the energy which gives it its fundamental tendency… All the expressions of the energy which determines the age are akin to each other. The task of analysis is to find the unity of valuation and purpose in different expressions of life… The context forms the horizon of the age and through it, finally, the meaning of every part in the system of the age is determined.
>
> ([8.35], 156)

For the sake of argument, let us suppose that this particular kind of unity is a more or less objective fact that can be discovered by the scientific historian. If so, we have solved one problem only to raise another—one of which Dilthey was acutely aware, indeed it concerned him deeply. Each age takes its own values, its own world-view, as unproblematically valid—this is even the necessary condition of its creativity—but historiography shows such assumptions to be naive and untenable. The historical study of human life reveals—this indeed is its point, and its glory—the immense variety of expressions of that life, including values and world-views. But the obverse of this is the problem of historical relativism:

> Historical comparison reveals the relativity of all historical convictions. They are all conditioned by…circumstances… Historical consciousness increasingly proves the relativity of every metaphysical or religious doctrine which has emerged in the course of the Ages.
>
> ([8.36], 112)

The same applies to 'values, obligations, norms and goods'. Dilthey writes:

> History does indeed know the positing of something unconditional as value, norm, or good… But historical experience knows only the process of positing… and nothing of their universal validity. By tracing the course of development of

> such unconditional values, goods or norms, it notices that life has produced different ones and that the unconditional positing itself becomes possible only because the horizon of the age is limited… It notices the unsettled conflict among the unconditional positings.
>
> ([8.35], 165)

This state of affairs Dilthey called 'the wound brought about by the knife of historical relativism' ([8.60], 21).

Is the wound so fatal? Does the 'chaos' of conflicting world-views and values mean that none of them can be objectively true, or—worse—that there is no such thing as objective truth in these realms? It might well seem that such sceptical and unsettling conclusions do *not* follow from any amount of historical evidence. But here we must remind ourselves of Dilthey's philosophy of values, which like everything else in his philosophy rests finally on the bedrock of 'life'—values arise *in life*, and there is nothing 'behind' life to which we can appeal. The relativist implications of Dilthey's combination of ethical subjectivism and historicism seem inescapable.

Yet Dilthey sought to escape them, and to assert at least some universal values—even to deduce them as implications of his philosophy of history and the human sciences. These are values of individualism, freedom and creativity. According to Dilthey 'the dignity and value of every individual' is an unconditional value ([8.35], 74); 'the individual is an intrinsic value [which] we can ascertain beyond doubt' ([8.36], 224). Why so? Because says Dilthey, the individual is the ultimate 'subject-matter of understanding'. 'Understanding has always an individual for its object' ([8.71], 276). A philosophy of human sciences which proposes to understand mental life must presuppose the value of the bearer of mental life, the human individual.

Furthermore, Dilthey's philosophy of the human sciences is posited on a conception of mankind as being (unlike nature) free and genuinely creative. A historiography which reveals a multiplicity of values and world-views is a revelation of this freedom and creativity. Revelation of this truth is liberating. Historicism, therefore, continues and even completes the increasing realization of man's potential for freedom and creativity that was earlier carried forward by such episodes as the Renaissance, the Reformation and the Enlightenment:

> The historical consciousness of the finitude of every historical phenomenon… and of the relativity of every kind of faith, is the last step towards the liberation of mankind. With it man achieves the sovereignty to enjoy every experience to the full and surrender himself to it unencumbered, as if there were no system of philosophy or faith to tie him down… The mind becomes sovereign over the cobwebs of dogmatic thought… And in contrast to relativity, the continuity of creative forces asserts itself as the central historical fact.
>
> ([8.35], 167)

Alas, this resolution of the problem hardly seems satisfactory. Dilthey seems to oscillate uneasily between spelling out what he takes to be the moral implications of a humanistic science, and extracting a historicist ethic from its findings. This latter kind of argument

hardly seems open to him, given his denial that history has any necessary *telos* or goal. We surely do not want to put the values of individuality, freedom and creativity at the mercy of unpredictable historical trends. The last quotation cited above bristles with problems. How can Dilthey predict with such confidence the liberating effects of the 'historical consciousness', given his view that history is inherently unpredictable? And suppose his prediction is right—is it really desirable that people become free 'to enjoy *every* experience to the full'? The problem of liberty and its proper limits cannot be solved by invoking history in this way. A historicist ethic is liable to end up with either an arbitrary interpretation of history, or an undiscriminating endorsement of whatever happens. Dilthey, unhappily, falls into the latter trap. Let us fill in some gaps left in the last quotation above. 'The mind' writes Dilthey 'becomes sovereign over the cobwebs of dogmatic thought'. He continues:

> Everything beautiful, everything holy, every sacrifice relived and interpreted, opens perspectives which disclose some part of reality. And equally, we accept the evil, horrible and ugly, as filling a place in the world, as containing some reality which must be justified in the system of things.

Do we? Must it? Surely not.

DILTHEY'S HUMANISM

Dilthey's attempts to solve the problem of relativism led him to an unacceptable conclusion; however, the problem itself is, in part, the obverse of what is perhaps most attractive in his philosophy, namely what may be called his humanism—his passion to understand all the varied and multifarious expressions of the human spirit. Dilthey stressed equally the enormous variety of these expressions, and the fundamental unity of human nature from which they spring. As he put it in a famous remark, for interpretation of the expressions of human life to be necessary—to be a science—there must be something alien about them, something puzzling that sets us a problem of understanding: on the other hand, if they were utterly alien, interpretation and understanding would be impossible. His entire enterprise therefore presupposes a fundamental unity of the human race.

DILTHEY'S INFLUENCE

Dilthey's influence on later thought has undoubtedly been significant, in both philosophy and the social sciences. So far as philosophy is concerned, a recent discussion underlines his relevance to the shaping 'of the dominant Continental movements of phenomenology, existentialism, and hermeneutic philosophy' ([8.87], vii). In Dilthey's relations with Edmund Husserl (the chief creator of phenomenological philosophy) influences in fact ran in both directions. The two men met in the winter of 1905/6, and, according to Husserl's own testimony, thereafter 'the problems pertaining to phenomenology as a

human science…occupied me more than almost all other problems' ([8.87], ix–x). There is no doubting the influence of Dilthey's 'philosophy of life' on Husserl's central concept of the 'life world'. Equally clear is the kinship between some of Dilthey's ideas and those of the existentialism of Martin Heidegger—for example, the key role of time and memory in human life, the conception of man as essentially free and creative, and the corresponding relativity of values. Another existentialist philosopher, Karl Jaspers, explicitly acknowledged Dilthey's influence on his thinking (in his *Allgemeine Psychopathologie,* a work of psychiatry rather than philosophy—nevertheless the influence is likely to have been more general). Dilthey's importance for the hermeneutic movement in philosophy is almost too obvious to mention (a recent review in the *Times Literary Supplement,* 24 July 1992, p. 7, refers to him simply as 'the founder of modern hermeneutics'). But it is perhaps worth pointing out, in this connection, that (for example) Hans-Georg Gadamer's well-known concept of the 'fusion of horizons' seems clearly to be a response to Dilthey's references to the 'closed horizon' of the historical period *(Zeitalter).* Equally obviously, Jürgen Habermas, leading contemporary representative of the 'critical theory' of the Franfurt School, is indebted to Dilthey for his categorization of human knowledge—or rather for two-thirds of it, since Habermas has turned Dilthey's dichotomy into a trichotomy. However, Habermas's category of 'historical-hermeneutic sciences' has an unmistakable Diltheyan ring, while his category of 'empirical-analytic sciences' stemming from a human interest in technical control of nature has much in common with Dilthey's conception of the *Naturwissenschaften.*

Even more important, perhaps, has been Dilthey's influence on social science and psychology, or rather on those within these 'human sciences' who resist their assimilation to the natural sciences. In anglophone psychology Dilthey's influence has not been great (it has been swamped by the behaviourists and Freudians) but in the German-speaking world it has given birth to a movement known as *verstehende Psychologie* and has been influential with a number of psychiatrists, such as Heinz Hartmann and Ludwig Binswanger ([8.60], 160). Cultural anthropology is another field in which significant influence has been attributed to Dilthey—Franz Boas attended his lectures in Berlin, while Ruth Benedict explicitly invokes Dilthey in her *Patterns of Culture* ([8.60], 175). But if Dilthey has been influential within the social sciences, it has been above all by influencing one of the most influential of all social scientists, Max Weber. Marianne Weber, in her famous biography of her husband, informs us that Dilthey was a frequent visitor to the Weber household in Berlin ([8.111], 39) and confirms that Weber based his own concept of *Verstehen,* so central to his sociology, on that of Dilthey ([8.111], 312). Another central concept of Weberian sociology—that of meaning and the meaningful—likewise looks to have a Diltheyan ancestry. However, some care is needed here, and it is perhaps as important to point to the differences as to the similarities in the conceptual schemes of the two men. According to Weber, the subject-matter of the social sciences is 'social action', and by 'action' he means 'all human behaviour when and insofar as the acting individual attaches a subjective meaning to it' ([8.112], 88) In other words, for Weber, the meaning of an action is defined by the agent's motives and intentions: understanding is grasping these motives and intentions. Weber's concept of understanding or *Verstehen,* therefore, seems to derive from the earlier, pre-hermeneutic phase of Dilthey's thought—the later, hermeneutic phase had no influence on him. Nor

did Weber (unlike Dilthey) see any incompatibility between understanding *(Verstehen)* and causal explanation *(Erklären)*—in his view of the social sciences the two must go hand in hand.

BIBLIOGRAPHY

Original language editions

Only a fraction of Dilthey's work was published in his lifetime. Since his death, his students and followers have undertaken a multi-volume publication in German of his entire *oeuvre*, the *Gesammelte Schriften* (Collected Works). The undertaking, not yet complete, projects a total of thirty-two volumes. So far, twenty volumes have been published. The first twelve volumes were published jointly by B.G. Teubner of Stuttgart, and Vandenhoeck & Ruprecht of Göttingen; subsequent volumes by Vandenhoeck & Ruprecht alone. The titles, editors and original publication dates of individual volumes are as follows:

8.1 Vol. 1: *Einleitung in die Geisteswissenschaften: Versuch einer Grundlegung für das Studium der Gesellschaft und der Geschichte*, ed. B.Groethuysen, 1922.

8.2 Vol. 2: *Weltanschauung und Analyse der Menschen seit Renaissance und Reformation*, ed. G.Misch, 1914.

8.3 Vol. 3: *Studien zur Geschichte des deutschen Geistes*, ed. P.Ritter, 1921.

8.4 Vol. 4: *Die Jugendgeschichte Hegels und andere Abhandlungen zur Geschichte des deutschen Idealismus*, ed. H.Nohl, 1921.

8.5 Vol. 5: *Die geistige Welt: Einleitung in die Philosophie des Lebens. Erste Hälfte: Abhandlungen zur Grundlegung der Geisteswissenschaften*, ed. G.Misch, 1924.

8.6 Vol 6: *Die geistige Welt: Einleitung in die Philosophie des Lebens. Zweite Hälfte: Abhandlungen zur Poetik, Ethik und Pädagogik*, ed. G.Misch, 1924.

8.7 Vol. 7: *Der Aufbau der geschichtlichen Welt in den Geisteswissenschaften*, ed. B.Groethuysen, 1927.

8.8. Vol. 8: *Weltanschauungslehre: Abhandlungen zur Philosophie der Philosophie*, ed. B.Groethuysen, 1931.

8.9 Vol. 9: *Pädagogik: Geschichte und Grundlinien des Systems*, ed. O.F. Bollnow, 1934.

8.10 Vol. 10: *System der Ethik*, ed. H.Nohl, 1958.

8.11 Vol. 11: *Vom Aufgang des geschichtlichen Bewusstseins: Jugendaufsätze und Erinnerungen*, ed. E.Weniger, 1936.

8.12 Vol. 12: *Zur preussischen Geschichte*, ed. E.Weniger, 1936.

8.13 Vol. 13: *Leben Schleiermachers, Erster Band* (in two half-volumes), ed. M. Redeker, third edn 1970.

8.14 Vol. 14: *Leben Schleiermachers, Zweiter Band* (in two half-volumes), ed. M. Redeker, 1966.

8.15–17 Vols. 15–17: *Zur Geistesgeschichte des 19. Jahrhunderts*, ed. U.Herrmann, 1970–4.

8.18 Vol. 18: *Die Wissenschaften vom Menschen, der Gesellschaft und der Geschichte: Vorarbeiten zur Einleitung in die Geisteswissenschaften*, ed. H.Johach and F.Rodi,

1977.

8.19 Vol. 19: *Grundlegung der Wissenschaften vom Menschen, der Gesellschaft und der Geschichte: Ausarbeitungen und Entwürfe zum zweiten Band der Einleitung in die Geisteswissenschaften,* ed. H.Johach and F.Rodi, 1982.

8.20 Vol. 20: *Logik und System der philosophischen Wissenschaften,* ed. H.Lessing and F.Rodi, 1990.

N.B.Rickman 1976 [8.36], contains (pp. 264–6) an extremely useful English translation of the table of contents of each volume of the *Gesammelte Schriften* up to vol. 17.

Other works by Dilthey, not yet included in the Gesammelte Schriften

8.21 *Das Erlebnis und die Dichtung: Lessing, Goethe, Novalis, Hölderlin,* first published 1906, and frequently reprinted, e.g. Göttingen: Vandenhoeck & Ruprecht, 1970.

8.22 *Mozart: Figaro, Don Juan, die Zauberflöte,* Tiessen, 1986.

8.23 Gadamer, H.G. ed., *Grundriss der allgemeinen Geschichte der Philosophie,* Frankfurt am Main: Klostermann, 1949.

8.24 Nohl, H., ed., *Die grosse Phantasiedichtung und andere Studien zur vergleichende Literaturgeschichte,* Göttingen: Vandenhoeck & Ruprecht, 1954.

8.25 Nohl, H. and G.Misch, eds, *Von deutscher Dichtung und Musik: Aus den Studien zur Geschichte des deutschen Geistes,* first published 1932, 2nd edn, Stuttgart: B.G.Teubner; Göttingen: Vandenhoeck & Ruprecht, 1957.

Letters and diaries

8.26 Misch, C. ed., *Der junge Dilthey: Ein Lebensbild in Briefen und Tagebüchern, 1852–70,* first published 1933, 2nd edn, Stuttgart, B.G.Teubner; Göttingen: Vandenhoeck & Ruprecht, 1960.

8.27 Schulenburg, S. v.d. ed., *Briefwechsel zwischen Wilhelm Dilthey und dem Grafen Paul Yorck v. Wartenburg 1877–1897,* Halle: Max Niemeyer, 1923.

8.28 'Der Briefwechsel Dilthey-Husserl' (with introduction by W.Biemel), *Man and World,* 1 (1968): 428–46. (English translation in P.McCormick and F.Elliston, eds., *Husserl: Shorter Works,* Notre Dame, Indiana, Notre Dame University Press, 1981.)

English translations

8.29 *Dilthey's Philosophy of Existence: Introduction to Weltanschauungslehre,* trans. W.Kluback and M.Weinbaum, London: Vision, 1960.

8.30 *The Essence of Philosophy,* trans. S.A.Emery and W.T.Emery, New York: AMS, 1969.

8.31 *Descriptive Psychology and Historical Understanding,* The Hague: Martinus Nijhoff, 1977. Contains 'Ideas Concerning a Descriptive and Analytic Psychology', trans. R.M.Zaner, and 'The Understanding of Other Persons and their Expressions of Life', trans. K.Heiges. There is a lengthy introduction by R.A.Makkreel.

8.32 *Introduction to the Human Sciences,* trans. R.J.Betanzos, London: Harvester Wheatsheaf and Wayne State University Press, 1988.

8.33 Makkreel, R.A. and F.Rodi, eds., *Poetry and Experience,* Princeton: Princeton University Press, 1985. (This is vol. 5 of a projected *Selected Works* in six volumes.)
8.34 Makkreel, R.A. and F.Rodi, eds., *Introduction to the Human Sciences,* Princeton: Princeton University Press, 1989. (Vol. 1 of the *Selected Works*.)
8.35 Rickman, H.P., ed., *Meaning in History: W.Dilthey's Thoughts on History and Society,* London: Allen & Unwin, 1961. Contains selections from vol. 7 of the *Gesammelte Schriften,* with commentaries.
8.36 Rickman, H.P., ed., *Dilthey: Selected Writings,* Cambridge: Cambridge University Press, 1976.
8.37 Hodges, H.A. *Wilhelm Dilthey: An Introduction,* London, Routledge & Kegan Paul, 1944. Contains some fifty pages of selections in translation.
8.38 'The Dream', trans. W.Kluback, in his *Wilhelm Dilthey's Philosophy of History,* New York: Columbia University Press, 1956.
8.39 'The Understanding of Other Persons and Their Life-Expression', trans. J.J.Kuehl, in P.Gardiner, ed., *Theories of History,* New York: Free Press, 1959.
8.40 'The Rise of Hermeneutics', trans. F.Jameson, in *New Literary History,* 3 (1972):229–44.
8.41 'The Eighteenth Century and the Historical World', trans. J.W.Moore, in P.Gay and G.J.Cavanaugh, eds., *Historian at Work,* vol. 4, New York and London: Harper & Row, 1975.

Bibliographies

CHAPTER 9
Logic and the philosophy of mathematics in the nineteenth century

John Stillwell

INTRODUCTION

In its history of over two thousand years, mathematics has seldom been disturbed by philosophical disputes. Ever since Plato, who is said to have put the slogan ‘Let no one who is not a geometer enter here’ over the door of his academy, mathematics has been the standard of exact truth against which other philosophical discourse is measured. Descartes’ *Discourse on Method* grew out of his *Geometry*. Spinoza wrote his *Ethics* in the style of Euclid’s *Elements*. And Leibniz dreamed of a *Characteristica Universalis* by means of which ‘we should be able to reason in metaphysics and morals in much the same way as in geometry and analysis’.

Mathematics is not only supremely logical, it is also astonishingly powerful. Here is how it struck Thomas Hobbes, according to Aubrey’s *Brief Lives:*

> He was 40 yeares old before he looked on Geometry; which happened accidentally. Being in a Gentleman’s Library, Euclid’s Elements lay open, and ‘twas the 47 *El. libri* I. He read the Proposition. *By G*——, sayd he (he would now and then sweare an emphaticall Oath by way of emphasis) *this is impossible!* So he reads the Demonstration of it, which referred him back to such a Proposition; which proposition he read. That referred him back to another, which he also read…that at last he was demonstratively convinced of that trueth. This made him in love with Geometry.
>
> ([9.1], 230)

It was this power of mathematics to draw unexpected conclusions, to solve difficult problems, that overcame the occasional philosophical doubts about the validity of its methods.

Up until 1800 the main doubts about mathematics centred on the following issues: the existence of irrational numbers; the use of numbers in geometry; the existence of imaginary numbers; infinite objects and processes.

Irrational numbers were a thorn in the side of the Pythagoreans (c. 500 BC), who believed that the natural numbers 1, 2, 3…were the key to understanding the universe. They found, for example, that musical harmony involved simple natural numbers—halving the length of a vibrating string raised its pitch an octave, reducing its length to 2/3 raised its pitch a fifth, and so on. However, they also found the theorem of

Pythagoras, which implies that the diagonal of the unit square is the square root of 2, $\sqrt{2}$, and then were horrified to discover that $\sqrt{2}$ is *not* a ratio of natural numbers. In their view, this meant $\sqrt{2}$ was not a number at all, and hence numbers were not an adequate measure of geometric quantities.

Rather than abandon geometry, the Greeks developed a geometric system parallel to arithmetic in which lengths were added and multiplied like numbers. It was also possible to *compare* a length such as $\sqrt{2}$ with ratios of natural numbers (rational numbers). That is, one could say whether $m/n < \sqrt{2}$ or $m/n > \sqrt{2}$ for any natural numbers m, n. The geometric meaning of $m/n < \sqrt{2}$ can be seen from the equivalent relation $m < n\sqrt{2}$ which says that the line segment consisting of m units of length is contained in the line segment consisting of n copies of $\sqrt{2}$. This occurs just in case $m^2 < 2n^2$. Thus the geometric relation $m/n < \sqrt{2}$ is in fact equivalent to the natural number relation $m^2 < 2n^2$.

Eudoxus (c. 350 BC) realised that to know the position (> or <) of a length ℓ relative to *arbitrary* rational numbers m/n is to know ℓ with complete precision. Hence calculations in the world of lengths are just as exact as those in the world of natural numbers. If $m/n < \ell$ and $m'/n' < \ell'$, for example, then one can conclude that $m/n + m'/n' < \ell + \ell'$, and in this way one knows all rational numbers less than $\ell + \ell'$. By such arguments, Eudoxus was able to develop a system of calculating with lengths and comparing them with (ratios of) natural numbers. It was preserved in Book V of Euclid's *Elements* and became known as the *theory of proportion*.

Eudoxus also developed a more general method for reasoning about geometric quantities called the *method of exhaustion*. Just as the theory of proportion captures an irrational by comparing it with arbitrary rationals, the method of exhaustion captures a figure of unknown magnitude by comparing it with known ones. Typically, a curve will be compared with polygons, and this may enable the exact determination of areas and volumes of curved figures when the corresponding polygonal ones are known.

For example, Archimedes showed that the area A of the parabolic segment (Figure 1) is 4/3 that of the inscribed triangle Δ_1 by showing

It follows that $A = 4\Delta_1/3$ because any value of A unequal to $4\Delta_1/3$ can be refuted by summing sufficiently many triangles $\Delta_1,\ldots,\Delta_n$. The method 'exhausts all possibilities' except $A = 4\Delta_1/3$ and, more importantly, each incorrect possibility is eliminated by reasoning about the *finite* sum of $\Delta_1,\ldots,\Delta_n$.

The theory of proportions and the method of exhaustion enabled mathematicians to sidestep their first encounter with infinity. It was not necessary to sum infinitely many triangles to determine A, for example; the sum of $\Delta_1,\ldots,\Delta_n$ was *sufficient, provided n was arbitrary*. One might say that infinity is present in the arbitrariness of n, but only 'potentially' so. The Greeks (and most mathematicians until the nineteenth century) drew a sharp distinction between the *potential infinity* which supplies natural numbers one by one, and the *actual infinity* which delivers them all at once. The concept of natural number is in fact potential infinity in a nutshell; the process of beginning with 0 and adding 1 'indefinitely' is what the natural numbers are all about. The idea that this process could ever be completed seems at first as unnatural and uncalled for as a last

natural number.

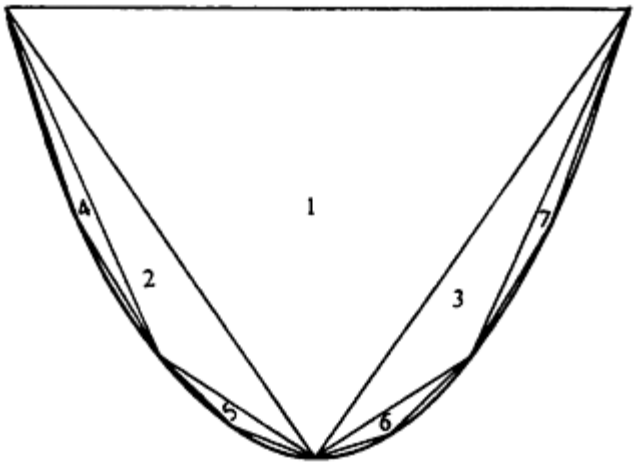

Figure 1

(1) *A* can be approximated arbitrarily closely by a finite sum of inscribed triangles $\Delta_1,\ldots,\Delta_n$ (indicated by their subscripts in Figure 1).
(2) $4\Delta_1/3$ is also approximated arbitrarily closely by such finite sums.

However, the distinction between potential and actual infinity is not so easy to maintain in other cases. Consider the following example. To travel a distance of one kilometer, say, one first has to reach the 0.9 kilometer mark, then the 0.99 kilometer mark, then the 0.999 kilometer mark…, and in general the $1–1/10^n$ kilometer mark for each *n*. One seemingly cannot complete the journey without also completing the infinity of values $1–1/10^n$. A similar example is discussed in Aristotle's *Physics*, 239b, 14, under the name of Zeno's paradox of Achilles and the tortoise. Aristotle refutes it by appealing to the (potentially) infinite divisibility of space and time. The kilometer can be subdivided at 0.9, 0.99, 0.999,…and the time interval required for the journey can be subdivided similarly, so completion of the journey involves only the *potential* infinity of subdivisions.

We do not know the purpose of Zeno (*c.* 450 BC) in formulating his paradoxes, since they are known to us only through Aristotle, who wished to debunk them. Nevertheless, Zeno does seem to have put the fear of infinity into Greek mathematics. It is otherwise hard to understand the rejection of irrational numbers, and the restriction to potential infinity even in cases where actual infinity seems harmless. We now know, in fact, that Archimedes used actual infinity to discover his results on areas and volumes. His original methods were uncovered only in 1906, thanks to some extraordinary detective work by Heiberg ([9.26], 5). By then, it was too late for them to have any effect on mathematical practice.

After the classical era, the next major encounter with infinity was in the seventeenth century. The occasion was the invention of the calculus, a resurgence of Archimedes'

theory of curved figures powered by the new algebraic geometry of Fermat and Descartes. Algebra made an enormous difference to geometry. Whereas Archimedes had to make an ingenious new approach to each new figure—for example, the approach to the parabolic segment using specially placed triangles—calculus dealt with a great variety of figures in the same way, via their equations. That was the whole point. Calculus was a method of *calculating* results, rather than proving them. If pressed, mathematicians could justify their calculations by the method of exhaustion, but it seemed impractical if not unnecessary to do so. Even before the stream of new results reached full flood with Newton and Leibniz (from 1665 onward) Huygens had warned:

> Mathematicians will never have enough time to read all the discoveries in Geometry (a quantity which is increasing from day to day and seems likely in this scientific age to develop to enormous proportions) if they continue to be presented in a rigorous form according to the manner of the ancients.
>
> ([930], 337)

In fact, Huygens was probably the only major mathematician who stuck to the ‘methods of the ancients’. The methods of calculus were so much more powerful and efficient that rigour became secondary. Hobbes and Berkeley wrote scathing attacks on the illogical language of ‘infinitesimals’ used by mathematicians as a substitute for exhaustion, but they could not deny that it got results. And what results! By the middle of the eighteenth century, calculus had solved almost all the problems of classical geometry, and new ones the ancients had not dreamed of. It had also revealed the secrets of the heavens, explaining the motions of the moons and planets with uncanny precision. Apart from a few marginal controversies over such things as the infinite series $1-1+1-1+\ldots$, all the results of calculus stood up to rigorous scrutiny.

The confidence inspired by the success of calculus was infectious. During the eighteenth century, mathematicians pushed their luck even further, using some concepts they did *not* know how to justify. They freely used $\sqrt{-1}$ while calling it ‘imaginary’ or ‘impossible’. They assumed that arbitrary continuous functions were expressible as infinite sums of sine waves. And once again their faith was rewarded, with an avalanche of new discoveries in mathematics and physics by d’Alembert, the Bernoullis, Euler and Lagrange. With this much success, mathematicians could afford to ignore philosophical questions about the meaning and rigour of their work. Only a direct contradiction in the heart of mathematics could give them pause. When it came, all the forgotten fears of irrationality and infinity would come back to the surface.

THE CRISIS IN GEOMETRY

Before 1800, geometry was thought to be part of physics. Its simplest elements—straight lines and circles—were idealizations of the simplest physical curves, constructed by the simplest drawing instruments, the straight edge and compasses. However, what set geometry apart from the rest of physics was its logical structure. It appeared that all properties of straight lines and circles (in the plane) were logical consequences of five

axioms postulated by Euclid in his *Elements* (*c.* 300 BC):

Let the following be postulated

1. To draw a straight line from any point to any point.
2. To produce a finite straight line continuously in a straight line.
3. To describe a circle with any centre and distance.
4. That all right angles are equal to one another.
5. That, if a straight line falling on two straight lines make the interior angles on the same side less than two right angles, the lines, if produced indefinitely, meet on that side on which are the angles less than the two right angles.

([9.27], 154)

Euclid's axioms were physically plausible, at least within the limits of measurement possible before 1800, though of course the fifth axiom could not be tested properly with finite lines. What was more important, in the opinion of most mathematicians and philosophers, was that no alternatives to Euclid's axioms could be *imagined*. In particular, it seemed impossible to imagine either of the following alternatives to axiom 5:

5^+. Two straight lines, if produced indefinitely, meet on *both* sides.

5^-. There are straight lines which fail to meet even though a straight line falling on them makes interior angles on the same side less than two right angles. (Or the following logical equivalent: given a line L and point P not on L there is more than one line through P not meeting L.)

The strongest statement of the *a priori* nature of geometry was made by Kant in his *Critique of Pure Reason*. Kant believed that the fact that we cannot imagine alternatives such as 5^+ and 5^- made Euclid's geometry the only one logically possible or meaningful:

> It is therefore, solely from the human standpoint that we can speak of space, of extended things, etc. If we depart from the subjective condition under which alone we can have outer intuition, namely, liability to be affected by objects, the representation of space stands for nothing whatsoever.
>
> ([9.31], 71)

Kant's philosophy was the high-water mark of intuitive geometry. The tide turned during the nineteenth century when mathematicians became increasingly absorbed with the construction of geometries contradicting Euclid, and later with the reconstruction of Euclidean geometry itself.

These investigations stemmed from dissatisfaction with Euclid's axiom 5, the so-called *parallel axiom*. Gauss, Bolyai and Lobachevsky realized that it was impossible to confirm the parallel axiom by physical experiment, and in fact conceivable that one could *refute* it. This was because the parallel axiom has the consequence that the angle sum (in radians) of any triangle is π. Since perfectly accurate measurement is impossible, one could never be sure that an angle sum measured to be π was in fact equal to π; and conceivably a triangle could be found with angle sum definitely *not* equal to π, i.e.

differing from π by more than experimental error. While no physical refutation of the parallel axiom succeeded at the time (success was not achieved until 1919, as part of the confirmation of general relativity theory) its very possibility was enough to encourage Gauss, Bolyai and Lobachevsky to explore an alternative to Euclidean geometry. Their investigations were made independently, roughly between 1800 and 1830, and reached similar conclusions.

Each of them studied the replacement of the parallel axiom by the axiom 5^{-}. The geometry that results from this replacement is now called *hyperbolic geometry*. It is in some ways more complicated than Euclidean geometry. For example, there are no similar figures of different sizes. There are no squares. Equilateral triangles of different sizes have different angles (always less than the angle $\pi/3$ of a Euclidean equilateral triangle). However, in other ways hyperbolic geometry is extremely elegant and convenient. The fact that equilateral triangles of different sizes have different angles yields an *absolute unit of length*. One could define the unit to be, say, the side of the equilateral triangle with angle $\pi/4$, since there is only one size of equilateral triangle with this angle. Likewise, the fact that the angle sum of a triangle is less than π makes it possible to show that the area of a triangle is proportional to the difference between π and the triangle's angle sum. Thus, in hyperbolic geometry, area can be measured by angles.

These beautiful consequences of axiom 5^{-}, and the non-appearance of any contradictory consequences, convinced Gauss, Bolyai and Lobachevsky that hyperbolic geometry was meaningful and worth pursuing. However, there was no immediate threat to the authority of Euclid and Kant. Gauss was too afraid of controversy to publish his results. Bolyai gave up soon after publication of his work in 1832, discouraged by the lack of response from other mathematicians and troubled by the possibility that contradictions might yet emerge. Lobachevsky published doggedly from the obscurity of Kazan from 1829 until 1856, the year of his death, without any encouragement from the outside world. (Gauss in fact admired Lobachevsky's work, but communicated his feelings only to his friend Schumacher in a letter [9.24].

But in 1855 Gauss died, and his interest in hyperbolic geometry became known to the mathematical world through the release of his unpublished papers. This led to a more widespread interest in hyperbolic geometry, particularly in the light of *differential geometry*, a field also pioneered by Gauss with his book on curved surfaces [9.23], and invigorated by the ideas of Riemann [9.38] on curved space of arbitrary dimensions.

On any smooth surface there are curves called *geodesics* which are 'as straight as possible' and hence can be regarded as the 'lines' of a 'geometry'. On the sphere, for example, the geodesics are the great circles, because a great circle gives the shortest distance between any two points on the sphere. The corresponding 'geometry' is *spherical geometry*, which studies such things as spherical triangles. Spherical geometry had in fact been studied since ancient times because of its applications to astronomy and navigation, but the idea of its being a 'geometry' with theorems contrary to those of Euclidean geometry had not come up, perhaps because its 'lines' are manifestly finite and closed.

However, the curved 'lines' on the sphere can be made straight by projecting the sphere from its centre on to a tangent plane (Figure 2). Admittedly, only half of each spherical 'line' can be seen at a time this way, and spherical distance becomes distorted. However, it does make spherical geometry look like a geometry of genuine lines, and it

raises an interesting question. For which surfaces is there a map to the plane carrying geodesics to straight lines?

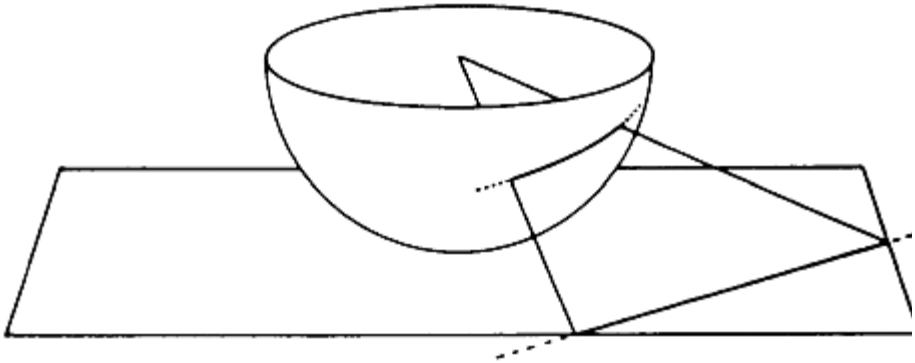

Figure 2

Beltrami [9.2] found the answer in terms of the *curvature* of the surface, a concept introduced in Gauss [9.22]. The surfaces whose geodesics can be mapped to straight lines are precisely those of *constant* curvature. The plane itself is of zero curvature, a sphere has constant positive curvature—which explained the known examples—but there are also surfaces of constant *negative* curvature. The first of these to be discovered was the *pseudosphere,* a trumpet-shaped surface (Figure 3) whose geometry had been investigated by Gauss's student Minding in 1840. Minding even made the pregnant discovery that its triangles are governed by formulas like those for spherical triangles, but with the circular functions sine and cosine replaced by their hyperbolic analogues sinh and cosh (hence the name 'pseudosphere'). The same formulas had already been found to hold in hyperbolic geometry by Lobachevsky [9.34].

Unfortunately the pseudosphere cannot be regarded as a complete

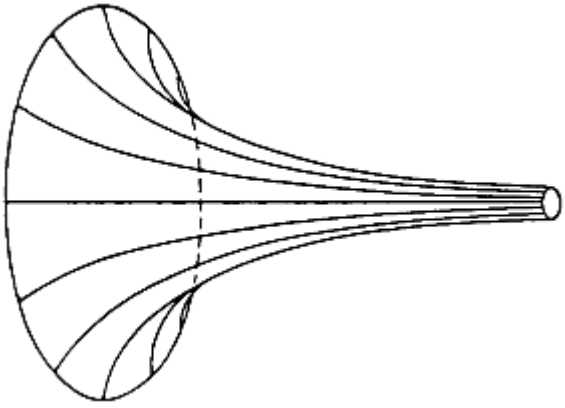

Figure 3

realization of hyperbolic geometry, because ‘lines’ on the pseudosphere do not extend indefinitely. The rim of the trumpet is an impassable boundary, beyond which the pseudosphere cannot be extended because its curvature becomes undefined there. In 1868 Beltrami [9.3] saw a way round this difficulty with his mapping of geodesics to straight lines. The pseudosphere is mapped on to a portion of the disc (Figure 4) and the line segments representing its geodesics have a natural exten

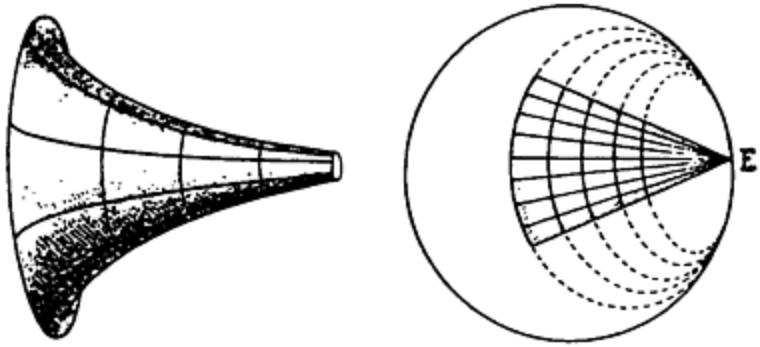

Figure 4

sion to the whole interior of the disc. (The boundary of the disc is infinitely far away, in the sense of distance on the pseudosphere. In particular, the point *E* represents the infinitely distant end of the trumpet.) Thus the whole interior of the disc has a geometry, inherited from the pseudosphere, and it is the *complete* hyperbolic geometry of Gauss, Bolyai and Lobachevsky. The validity of the hyperbolic parallel axiom 5^- is particularly clear, as Figure 5 shows.

Beltrami had found what we now call a *model* of hyperbolic geometry—an interpretation of the terms ‘point’, ‘line’, etc. within Euclidean geometry under which the axioms 1, 2, 3, 4, 5^- are satisfied.

It follows that the Gauss-Bolyai-Lobachevsky axioms *cannot lead to a contradiction*, unless there is a contradiction in Euclidean geometry itself. This was Beltrami’s great contribution to the philosophy of geometry. As he put it (rather modestly) in his 1868 paper:

> In recent times the mathematical public has begun to take an interest in some new concepts which seem destined, if they prevail, to change profoundly the whole complexion of classical geometry.
>
> These concepts are not particularly recent. The master Gauss grasped them at the beginning of his scientific career, and although his writings do not contain an explicit exposition, his letters confirm that he had always cultivated them and attest to his full support for the doctrine of *Lobachevsky*.
>
> …we have sought, to the extent of our ability, to convince ourselves of the results of *Lobachevsky’s* doctrine; then, following the tradition of scientific research, we have tried to find a real substrate for this doctrine, rather than

admit the necessity for a new order of entities and concepts. We believe we have attained this goal for the planar part of the doctrine.

(Beltrami 1868 in [9.17], 533)

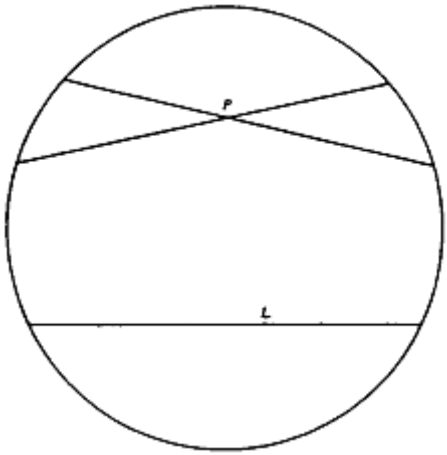

Figure 5

Beltrami's model showed that Euclid's axioms 1, 2, 3, 4, 5 are not the only logical possibility. It was therefore admissible to doubt that they were true of physical space.

If Euclid's geometry was not about physical space, what *was* it about?

ARITHMETIZATION

With the discovery of non-Euclidean geometry the nature and existence of geometric objects was called into question. It was time to take up an option which had been available for two centuries, but held back out of respect for the Greek tradition of separating the concepts of number and length—the *arithmetization* of geometry. Around 1630, Fermat and Descartes independently discovered the method of co-ordinates which makes it possible to describe curves by equations in variables x and y. Given two lines OX and OY in the plane (Figure 6), any point P is determined by its distances x and y from them. (It is convenient, though not necessary, to take OX and OY to be perpendicular, and to let y and x be the perpendicular distances from P to them.) As P traverses a curve in the plane, x and y enter a certain relationship, which Fermat and Descartes found they could easily describe in many important cases.

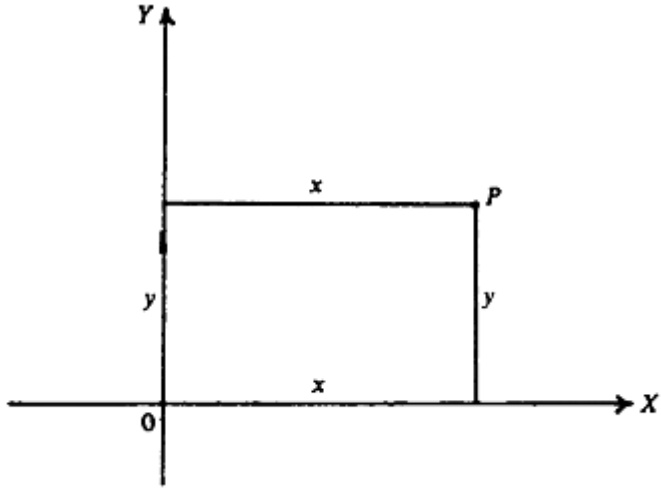

Figure 6

For example, if *P* describes the straight line passing through *O* and equidistant from *OX* and *OY*, then $y=x$. More generally, any straight line is described by an equation of the form

$$ax + by + c = 0$$ where *a*, *b*, *c* are constants,

and which we now call a *linear* equation for that reason. Conversely, any such equation (provided *a*, *b* are not both zero) represents a straight line, so there is a correspondence between lines and linear equations.

Linear equations are recognizable algebraically as those in which *x* and *y* occur to the first power. The next simplest equations, called *quadratic*, include terms in x^2, y^2 and xy as well as linear terms. Fermat and Descartes discovered that the curves described by quadratic equations are precisely the *conic sections* (ellipses, parabolas, hyperbolas), which had been studied by the Greeks, particularly by Apollonius, *c*. 200 BC. Apollonius even knew the relationship between *x* and *y* for a conic section, but he expressed it in words (taking about half a page!) and not as an equation. Lacking algebraic notation, the Greeks could hardly form the idea of equations, let alone manipulate them so as to be able to recognize the curves they described. Fermat and Descartes had the advantage of a well developed notation and technique for algebra, thanks to the efforts of their compatriot Viète (1540–1603) and the Italians del Ferro, Tartaglia, Cardano,

Ferrari and Bombelli in the sixteenth century. In turn, Descartes' *Geometry* (1637, [9.15]) made a big impression on Newton, who carried the analysis of equations beyond the range of classical geometry with a classification of *cubic* curves [9.37]. Thus by the end of the seventeenth century it was well established that curves could be studied by algebra, at least the curves expressed by *polynomial* equations, i.e. equations formed by applying arithmetic operations to *x* and *y*.

However, these developments did not prompt any reassessment of the nature of curves. No one said that curves were equations. Moreover, the variables *x* and *y* were regarded as

lengths rather than numbers. Thanks to Eudoxus' theory of proportions (see Introduction above), *x* and *y* could be regarded as lengths while only arithmetic operations were applied to them, so the Greek segregation of geometry from number remained in force. The inadequacies of the theory of proportions (and indeed the theory of numbers) were not exposed until questions about *curves in general* began to be asked in the eighteenth century. Perhaps the turning point was Gauss's proof of the fundamental theorem of algebra [9.22].

The exact statement proved by Gauss does not concern us here (the modern equivalent is that any polynomial equation has a solution in the complex numbers). The point of interest is the following statement *assumed* by Gauss in his proof. If K_1 and K_2 are curves inside a circle, and the endpoints A_1, B_1 of K_1 separate the endpoints A_2, B_2 of K_2 on the circle (Figure 7), then K_1 and K_2 have a common point. The only justification Gauss offered for this statement was that 'no one, to my knowledge, has ever doubted it'. This was probably true, but

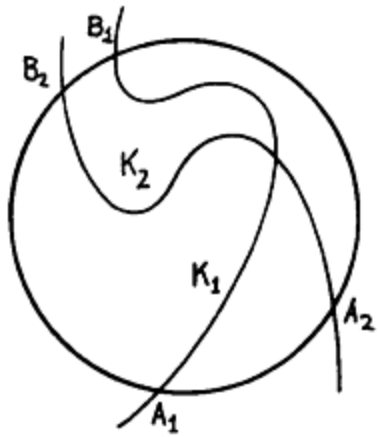

Figure 7

nevertheless a poor excuse, particularly since Gauss was well aware of gaps in previous attempts to prove the fundamental theorem, and at pains to point them out. Quite likely, the only reason the statement had never been doubted is that it had never previously been used in a mathematical proof. Gauss's proof was probably the first *existence proof* in the history of mathematics—one where the existence of a point was proved without a means of constructing it—and probably the first to use *topological* reasoning. The basic concept of topology, namely *continuity*, had not even been defined in 1799, and Gauss's claim is not easy to prove even when the notion of continuous curve has been made clear.

It seems that Gauss realised the seriousness of the gap in his proof, because in 1816 he offered another proof of the fundamental theorem of algebra in which the role of continuity was minimized. In his second proof he assumed only that if *p(x)* is a polynomial such that $p(a) < 0 < p(b)$ for some real numbers *a* and *b* then *p(c)*=0 for some *c* between *a* and *b*. This assumption, known as the *intermediate value theorem* (for

polynomials) can be viewed as a special case of the assumption in the first proof, namely, where K_1 is part of OX and K_2 is part of the curve $y=p(x)$ (Figure 8).

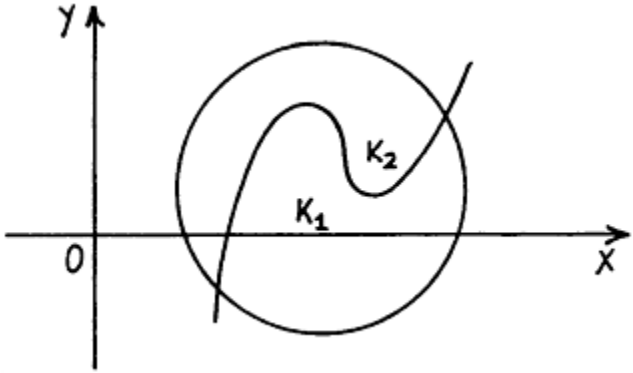

Figure 8

The intermediate value theorem is needed even to show the existence of $\sqrt[n]{2}$, which is the value for which $p(x) = x^n - 2$ becomes zero between, say, x=1 and x=2. Thus any proof of the fundamental theorem of algebra involves the intermediate value theorem, at least implicitly.

This point was recognized by Bolzano in 1817 [9.5], immediately after the appearance of Gauss's proof. Bolzano gave a proof of the continuity of polynomial curves $y=p(x)$, and attempted a proof of the intermediate value theorem for arbitrary continuous curves $y= f(x)$. His definition of continuity was essentially the modern one:

> a function fx varies according to the law of continuity for all values of x inside or outside certain limits means just that: if x is some such value, the difference $f(x+\omega) - fx$ can be made smaller than any given quantity provided ω can be taken as small as we please.
>
> (Bolzano 1817 in [9.17], 565)

However, his proof of the intermediate value theorem assumes the following *least upper bound* property of real numbers:

> whenever a certain property M belongs to all values of a variable quantity i which are smaller than a given value and yet not for all values in general, then there is always some *greatest* value u, for which it can be asserted that all $i<u$ possess property M
>
> ([9.17], 565)

Actually, the value u is *greatest lower bound* of the values *not* having property M. It is now more usual to consider the equivalent least upper bound property: every bounded set

of real numbers has a least upper bound. Bolzano was unable to prove this property rigorously because he did not have a definition of real number. Nevertheless, identifying the property was an important step. It set a requirement that any future definition of real number would have to meet, and was the first indication that further clarification of geometric concepts would depend on clarification of the concept of number.

WHAT IS A REAL NUMBER

In 1858, the last student of Gauss, Richard Dedekind, found himself teaching elementary calculus at the Polytechnic School in Zurich. He later wrote:

> In discussing the notion of the approach of a variable magnitude to a fixed limiting value, and especially in proving the theorem that every magnitude which grows continually, but not beyond all limits, must approach a limiting value, I had recourse to geometric evidences. Even now such resort to geometric intuition… I regard as exceedingly useful… But that this form of introduction into the differential calculus can make no claim to being scientific, no one will deny.
>
> ([9.14], 1)

Dedekind, too, had glimpsed the elusive least upper bound property. He was determined to capture it.

> I made the fixed resolve to keep meditating on the question until I should find a purely arithmetic and perfectly rigorous foundation for the principles of infinitesimal analysis. The statement is so frequently made that the differential calculus deals with continuous magnitude, and yet an explanation of this continuity is nowhere given; even the most rigorous expositions of the differential calculus do not base their proofs on continuity…they either appeal to geometric notions…or depend upon theorems which are never established in a purely arithmetic manner. Among these, for example, belongs the above-mentioned theorem, and a more careful investigation convinced me that this theorem, or any one equivalent to it, can be regarded in some way as a sufficient basis for infinitesimal analysis
>
> ([9.14], 7)

Having seen clearly what the difficulty was: ‘It then only remained to discover its true origin in the elements of arithmetic and thus at the same time to secure a real definition of the essence of continuity. I succeeded Nov. 24, 1858’ ([9.14], 2).

What then was Dedekind’s definition that captured the essence of continuity? In a nutshell, it was what Eudoxus would have said if he had believed in actual infinity. Like Eudoxus, Dedekind determined a length by comparison with rational numbers, but, unlike Eudoxus, Dedekind considered the totality of rational numbers to be an actual object—a *set*—and he declared the length being determined to be a *number*.

The length $\sqrt{2}$, for example, is greater than a positive rational m/n if and only if $2n^2>m^2$, as we observed in the Introduction above. This gives a numerical *process* for comparing m/n with $\sqrt{2}$, essentially Eudoxus' theory of proportions. Dedekind sought a numerical *object* he could identify with $\sqrt{2}$, and found it in the *completed outcome* of the comparison process, namely the pair of sets of positive rationals $\{m/n : 2n^2 < m^2\}$ and $\{m/n : 2n^2 > m^2\}$

In general, Dedekind defined a *real number* to be a partition of the rationals into two sets A_1, A_2 such that each member of A_1 is less than every member of A_2. He called such a partition a *cut*. Each rational number r itself produces a cut, or rather two cuts (one with r the maximum member of A_1, the other with r the minimum member of A_2), so the rationals are naturally absorbed into this more comprehensive concept of number. The real numbers also inherit natural operations of sum, product, etc. from the rational numbers. For example, if α is the cut (A_1, A_2) and (β is the cut (B_1, B_2) then $\alpha + \beta$ is the cut (C_1, C_2), where C_1 is the set of sums a_1+b_1 where a_1 is in A_1 (i.e. $a_1 < \alpha$) and b_1 is in B_1 (i.e. $b_1 < \beta$), and C_2 consists of the rationals not in C_1. In this way it becomes possible to prove results such as $\sqrt{2}\sqrt{3} = \sqrt{6}$, which Dedekind believed had not been proved rigorously before. (It would, however, have been possible to prove $\sqrt{2}\sqrt{3} = \sqrt{6}$ rigorously for *lengths* $\sqrt{2}$, $\sqrt{3}$, $\sqrt{6}$ by the theory of proportions.)

Finally, it was easy to prove the least upper bound property. If a real quantity α grows continually but not beyond a limit β say, consider the set L1 of all rationals belonging to lower sets A_1 of values of α. Then if L_2 is the set of rationals not in L_1 (in particular L_2 includes the rationals greater than β) it is easily seen that (L_1, L_2) is a cut and it is the least upper bound of the variable quantity α.

The least upper bound property is one of several equivalent statements of what Dedekind called the *continuity* of the real numbers (nowadays called the *completeness* of the real numbers). Another is that there is *no gap*, that is, no partition of the real numbers into sets A_1, A_2 with each member of A_1 less than every member of A_2, no maximum member of A_1 and no minimum member of A_2. This property is an almost immediate consequence of Dedekind's definition, which essentially *fills* each gap in the rational numbers by a real number.

As Dedekind pointed out, the continuity of the real numbers enables them to serve as a model of points on the line. Thus the key step in the arithmetization of geometry was finally achieved. With the *line* defined as the set of real numbers x, it is natural to define the *plane* as the set of ordered pairs of real numbers, (x, y), and then curves can be defined by equations in x and y. This programme was completed in the *Grundlagen der Geometrie* of Hilbert (1899, [9.26]). Incidentally, the pair (x, y) is also used as a concrete representative of the complex number $x + y\sqrt{-1}$, thus giving a meaning to 'imaginary' numbers (see Introduction above).

In the meantime, several other definitions of real number had been proposed, notably by Meray [9.32], Weierstrass [9.29] and Cantor [9.9]. Weierstrass [9.37] also gave the

first rigorous proofs of the fundamental theorems on continuous functions, in particular the intermediate value theorem anticipated by Bolzano [9.5]. Meray, Weierstrass and Cantor all defined real numbers as sets of convergent infinite sequences—definitely a more complicated approach than Dedekind's, but one more suited to modern analysis, where convergent sequences (of objects which are not necessarily numbers) are the stock in trade. All these definitions are equivalent, as it happens, so it does not matter which one is used to define the line.

The important question is whether it is necessary to accept completed infinities to arithmetize the concept of line. With hindsight, one can see how the cut defining $\sqrt{2}$, say, might be explained away as a potential infinity (see the next section). But can the infinity of real numbers be regarded as merely potential? This was one of the profound questions answered by Cantor in the next episode of our story—the development of set theory.

SETS

Cantor, like Dedekind, was drawn into accepting actual infinities in order to clarify the meaning of points on the line. In Cantor's case the problem was more technical (though with a pedigree going back to the Pythagorean investigation of vibrating strings), concerning the points of discontinuity of infinite sums of sine waves [9.9]. He found that such a set of points could be very complicated. So complicated, in fact, that an operation he used to 'thin' the set could be repeated infinitely often without removing all of it. He therefore decided to apply his thinning operation 'more than an infinite number of times', or rather, to continue applying it after the first infinity of applications was complete. The implication was, of course, that this infinity of operations was *actual*.

To count the number of applications of the thinning operation, Cantor [9.11] introduced *ordinal numbers*, a generalization of natural numbers to infinity and beyond. The first infinite ordinal number, following the complete series 0, 1, 2, 3,…, is called ω. It is followed by $\omega + 1, \omega + 2, \omega + 3$,…, and this second infinity of ordinal numbers is followed by a number called $\omega \cdot 2$. Any ordinal number α, like a natural number, has a successor $\alpha + 1$. Cantor [9.11] called this the 'first principle of generation' of ordinal numbers. He also introduced a second principle, which generates, ω, $\omega \cdot 2$ and further ordinals by wholesale actualization of infinities:

> If any definite succession of defined whole real [i.e. ordinal] numbers exists, for which there is no largest, then a new number is created, by means of this second principle of generation, which is thought of as the *limit* of these numbers, i.e. it is defined as the next number larger than all of them.
>
> ([9.11], 196)

In calling his ordinal numbers whole *real* numbers Cantor wished to stress their reality, i.e. the reality of infinite sets, rather than any analogy with the real numbers (which is *reell* in German and not the word *real* used by Cantor). There is a much better analogy with the natural numbers, of course, though it is striking that the ordinals share the least

upper bound property with the real numbers. The relationship between the ordinals and the real numbers was in fact an unsolved problem of Cantor's set theory, the *continuum problem*, and it remains today one of the great mysteries of mathematics. As will become clearer below, the real numbers are generated by a principle which is possibly even more powerful than Cantor's second principle of generation for ordinal numbers.

Cantor's investigation of sets of real numbers led him to another generalization of the concept of natural number, the concept of *cardinal number*. Two sets *A* and *B* are said to have the *same* cardinal number if there is a *one-to-one correspondence* or *pairing* between the members of *A* and the members of *B*. The cardinal number of a finite set *A* is simply the (natural) number of members of *A*, because if *A* has, say, seventeen members then any set *B* whose members can be paired with the members of *A* will also have seventeen members. The set of all natural numbers has an infinite cardinal number which Cantor called $\aleph_0$

Cantor found that many seemingly 'larger' × sets can be put in one-to-one correspondence with the natural numbers, and hence also have cardinal number $\aleph_0$. One such set is the rational numbers. Another, as Cantor [9.10], found, is the *algebraic numbers*. A number is called algebraic if it is the solution of an equation

$$(*)\quad a_n x^n + a_{n-1}x^{n-1} + \cdots + a_1 x + a_0 = 0$$

where a_0, a_1,..., a_n are integers. Cantor observed that if each such equation is assigned the 'height'

$$h = |a_0| + |a_1| + \cdots + |a_n| + n$$

then there are only finitely many equations with height *h* less than a given natural number *i*. It is therefore possible to make a (potentially infinite) list consisting of all equations of height $\leqslant 1$, then all equations of height $\leqslant 2$, then all equations of height $\leqslant 3$..., thus obtaining a list of all equations (*), in which each equation has some natural number position *j*. This puts the equations (*) in one-to-one correspondence with the natural numbers *j*. Finally, if each equation is replaced by the (finite) list of its solutions we get a list of all algebraic numbers, on which each algebraic number appears at some natural number position *k*.

The listing of the algebraic numbers is a very strong result, since it includes listings of many other sets, in particular the integers and the rational numbers. It follows that all these sets have cardinal number $\aleph_0$. However, it does not follow that the set of all real numbers has cardinal number $\aleph_0$. It was already known, from the work of Liouville [9.33], that certain real numbers are not algebraic. Cantor [9.10] discovered the more dramatic result that *almost all* real numbers are not algebraic. He showed that the cardinal number of the reals is not $\aleph_0$, by showing that the reals cannot be paired with the natural numbers. This result is known as the *non-denumerability* or *uncountability* of the set of real numbers.

Non-denumerability was so unprecedented that Cantor initially attempted to downplay

it as far as possible, calling his paper 'On a Property of the Collection of All Real Algebraic Numbers' and using non-denumerability only to give a new proof of Liouville's result. (The algebraic numbers have cardinal number $\aleph_0$, the reals do not, so not all reals are algebraic, QED.) He soon realized, however, that non-denumerability was the gateway to a new world. It revealed the existence of cardinal numbers beyond $\aleph_0$, so mathematics was able to distinguish different kinds of infinity. It also showed that the real numbers could not be explained away as a potential infinity. For what is a potential infinity but one whose members can be paired with the natural numbers?

As pointed out in the Introduction above, the natural numbers 0, 1, 2,…are the epitome of a potential infinity—a list which includes any given member, if carried sufficiently far. The non-denumerability of the reals means that any proposed listing of real numbers is doomed to incompleteness—certain numbers (depending on the list, of course) will never appear on it, no matter how long the list is continued.

In 1891 [9.12] Cantor gave a second proof of non-denumerability which makes the futility of listing real numbers crystal clear. Suppose that x_1, x_2, x_3,… is a list of real numbers, and let x_i be expanded as a decimal up to and including the ith decimal place. For example, the list may begin like this: $x_1 = 17.7\ldots, x_2 = 0.16\ldots, x_3 = 2.131\ldots, x_4 = 0.7474\ldots, x_5 = 11.11312\ldots$ No matter how the list continues, a number x *not on it* may be constructed by making x different from x_1 in the first decimal place, different from x_2 in the second decimal place, different from x_3 in the third decimal place…, and so on. An explicit way to do this (which avoids getting an expansion which is ultimately all 9s or all 0s, and hence expressible in two ways) is to let the ith decimal place of x be 1 if the ith decimal place of x_i, is *not* 1, and otherwise let it be 2. Thus no list includes all the real numbers.

Since the number x is constructed from the sequence of digits along the diagonal of the list, this technique came to be known as the *diagonal argument*. It was actually used before Cantor by du Bois Reymond [9.16], though in a less transparent way. Cantor [9.12] was the first to see that the diagonal argument was not simply a trick with numbers but actually a fundamental insight into the relationship between sets and their subsets, showing that *any set has more subsets than members*. This yields the astonishing conclusion that *there is no largest set*.

To apply the diagonal argument in the general case let S be any set, and let S_X be a sub-set paired with element x. (You may like to think of S_x laid out in a 'row' beside element x, which is in a 'column' of the members of S.) Then one sub-set of S which is not among the sets S_X is the 'diagonal sub-set' D defined as follows:

x belongs to D if and only if x does not belong to S_X.

This ensures that D is different from each S_x, with respect to the element x in fact, and hence there are more sub-sets of S than members of S. The operation of forming all sub-sets of a given set is called the *power set* operation. This is the operation, mentioned above, which is possibly more powerful than the second principle of generation of ordinal numbers. While the generation of ordinal numbers admits a larger number only when

there is some way of 'approaching' it, the power set operation creates a new set without offering any means of approach.

In the case where *S* is the set of natural numbers it is easy to show (though a little technical) that the power set of *S* has the same cardinal number as the set of real numbers. Thus the continuum problem, which asks how big an ordinal number is required to count the real numbers, is about the size of the power set of the natural members.

WHAT IS A NATURAL NUMBER?

With the help of the set concept, Dedekind had reduced the concept of real number to the concept of rational number, as explained on pp. 255–7. Since relations between rational numbers are equivalent to relations between natural numbers, this meant that all the concepts of geometry and analysis were definable in terms of sets and the natural numbers 0, 1, 2, 3,… Most mathematicians felt that this was as solid a foundation as it was necessary or possible to have. After all, statements about the natural numbers were not contested (the way the parallel axiom, or the intermediate value theorem had been, for example) and no simpler concept than natural number seemed likely as a basis for mathematics.

In taking this view, mathematicians tended to overlook the fact that the foundation was not just the natural numbers, but natural numbers *and* sets. Sets were unavoidable, as experience with the real numbers made clear, so if there was a simpler basis for mathematics than natural numbers and sets it had to be just sets.

The first to grasp this possibility was Gottlob Frege, who developed a definition of natural numbers in terms of sets, or more precisely in terms of *properties,* in his 1884 book *Die Grundlagen der Arithmetik* [9.19]. There is a subtle but important difference between sets and properties (or *concepts,* as Frege called them). Corresponding to each set *S* there is the property of belonging to *S,* and for each property *P* there is the *extension of P,* consisting of all things with property *P* (or of all things *which fall under concept P,* as Frege put it). However, the extension of a property can have paradoxical behaviour if one assumes it to be a set (see pp. 266–8). This was not known in 1884, so there is no distinction between sets and extensions of properties in the *Grundlagen*. To make a distinction possible, and at the same time to give a concise description of Frege's original idea, we shall use the term *class* for the extension of a property.

Frege began with a highly entertaining demolition of previous attempts to define the notion of number, then opened his own investigation by defining what it means for two classes to have the same number. Like Cantor, he said that this is the case when there is a one-to-one correspondence between their members, though he pointed out that for finite classes this criterion had already been given by Hume (*A Treatise of Human Nature,* Book I, part III, section I). Note that it is not necessary to use the number 1 to define one-to-one correspondence. A relation $\phi(x, y)$ between the elements *x* of a class *X* and the elements *y* of a class *Y* is a one-to-one correspondence if

for each *x* in *X* there is a *y* in *Y* such that $\phi(x, y)$,

for each y in Y there is an x in X such that $\phi(x, y)$,
if $x \neq x'$ and $\phi(x, y)$ and $\phi(x', y')$ then $y \neq y'$,
if $y \neq y'$ and $\phi(x, y)$ and $\phi(x', y')$ then $x \neq x'$

The *number of a class X* may then be defined as the property of admitting a one-to-one correspondence with *X*, i.e. the class of all classes that admit a one-to-one correspondence with *X* ([9.19], 79).

Frege spent some time discussing the numbers 0 and 1. Any contradictory property serves to define a class with number 0, and Frege used the property 'not identical with itself'. Thus 0 is the class of classes admitting a one-to-one correspondence with the (empty) class of things not identical with themselves. The concept of the empty class was novel, and Frege felt he would have to overcome some resistance to the idea:

> Some may find it shocking that I should speak of a concept in this connection. They will object, very likely, that it contains a contradiction and is reminiscent of our old friends the square circle and the wooden iron. Now I believe that these old friends are not so black as they are painted. To be of any use is, I admit, the last thing we should expect of them; but at the same time, they cannot do any harm, if only we do not assume that there is anything that falls under them.
>
> ([9.19], 87).

Frege proceeded to show that the empty class is not only harmless, but wonderfully fertile, by pulling the natural numbers out of it, one by one. First

> 1 is the number which belongs to the concept 'identical with 0'.
>
> ([9.19], 90)

That is, 1 is the class of classes which admit one-to-one correspondence with the class whose member is 0. Then to define *n+1*,

> we shall choose the concept 'number of the series of natural numbers ending with *n*'.
>
> ([9.19], 92)

That is, *n+1* is the class of classes which admit one-to-one correspondence with the class whose members are 0, 1,…, n. Admittedly, there is something to be proved before we know that 'the series of natural numbers ending with *n*' is well defined. However, this was a matter of pure logic, which Frege already understood. As we shall see in the next section, he had laid the foundations of mathematical logic in 1879.

Thus Frege's work in 1884 was essentially the last step in a reduction of mathematics to pure logic, the previous steps being the definition of the real numbers in terms of rationals and the arithmetization of geometry and analysis. This stunning achievement

went unnoticed at the time, even by Frege himself. Strange as it may seem, Frege rejected the arithmetization of geometry, so he missed the opportunity to extend his ideas beyond the field of number. When Hilbert's *Grundlagen der Geometrie* [9.28] appeared in 1899, Frege wrote him several long letters ([9.20], 34) protesting against Hilbert's definitions of 'point' and 'line' and insisting on spatial intuition as the source of geometric axioms. He seemed oblivious to all that had happened in geometry since Kant. The opportunity Frege missed was taken up by Bertrand Russell (with due credit to Frege) only after the turn of the century.

WHAT IS LOGIC?

Logic has been a part of mathematics since ancient times, but until the nineteenth century it was the least understood part. In mathematics there was no 'theory' of logic the way there was a theory of numbers, for example, no attempt to analyse the content of logic and to describe it completely. It is true that Leibniz and others had dreamed of making logic as exact and mechanical as calculation, but little progress resulted from these speculations. The proper understanding of logic arose from the attempt to understand the foundations of mathematics, and eventually encompassed it.

The first important, though small, step was taken by George Boole. In his *Mathematical Analysis of Logic* (1847, [9.6]) and *The Laws of Thought* (1854, [9.7]) he introduced a logic of classes which is now known as Boolean algebra. In a deliberate imitation of algebraic notation, he used *x, y, z,*…to denote classes, and let xy, $x+y$ *and* $x-y$ denote intersection, union and relative complement respectively. Since a thing belongs to

> *xy* if and only if it belongs to *x and* to *y*, to $x+y$ if and only if it belongs to *x or* to *y*, to $x-y$ if and only if it belongs to *x and not* to *y*,

the algebra of Boole's product, sum and difference reflects the logic of 'and', 'or' and 'not', or *propositional logic* as it is now called. This algebra is not exactly the same as ordinary algebra—for example, $x^2 = x$ for any class x—but it was near enough for Boole to venture the opinion that

> There is not only a close analogy between the operations of the mind in general reasoning and its operations in the particular science of Algebra, but there is to a considerable extent an exact agreement in the laws by which the two classes of operations are conducted.
>
> ([9.7], 6)

He was correct in thinking that his algebra was similar to ordinary algebra in its operations and laws, but quite mistaken in thinking that such an algebra could reflect 'general reasoning'. If thought was really as simple as Boole's algebra we should not be able to grasp very much mathematics, not even the concept of number, as Frege realized in 1879. By reflecting on this difficulty, Frege was able to discover a vastly more

powerful system of logic.

The difference between Boole and Frege was that Boole was looking for a mathematics of logic, whereas Frege was looking for a logic of mathematics. Boole's search was less fruitful, because the mathematics of his time contained a reflection of only a small part of logic—the logic of 'and', 'or' and 'not'. We can now see that Frege made a better choice, but still it is astounding that he was able to succeed so completely at his first attempt.

Frege's logical system came to life fully grown in his *Begriffsschrift (Concept Writing)* of 1879 [9.18]. Unlike the *Grundlagen* of 1884, the *Begriffsschrift* is not a masterpiece of clear and persuasive writing; in particular, most of its logical content is expressed in a strange, labyrinthine symbolism of Frege's own invention. Frege believed that the structure of deduction is best revealed by displaying it in a two-dimensional, treelike form. He managed to overcome his printer's objections to this typographical nightmare, but apparently forgot that readers, too, prefer symbols to follow one another in a sequence. Fortunately it is now possible to translate the *Begriffsschrift* into a widely accepted notation, and I shall do so in what follows.

The first difference one sees between Frege and Boole is that Frege regards the laws of logic not as algebraic identities but as *theorems* derivable from *axioms* by certain *rules of inference.* In the part of Frege's logic that coincides with Boole's, namely prepositional logic, the difference shows itself as follows. Instead of Boole's 'and', 'or' and 'not', Frege uses 'if…then' and 'not', which we shall denote by $\rightarrow$ and ~ respectively. This difference is not really important, since 'and', 'or', 'not' are expressible in terms of 'if… then', 'not' and vice versa, but 'if…then' and 'not' more naturally reflect the processes of deduction. In terms of $\rightarrow$, ~, Frege's axioms are:

1
$$a \rightarrow (b \rightarrow a).$$
2
$$c \rightarrow (b \rightarrow a)) \rightarrow ((c \rightarrow b) \rightarrow (c \rightarrow a)).$$
3
$$(d \rightarrow (b \rightarrow a)) \rightarrow (b \rightarrow (d \rightarrow a)).$$
4
$$(b \rightarrow a) \rightarrow ((\sim a) \rightarrow (\sim b)).$$
5
$$(\sim\sim a) \rightarrow a.$$
6
$$a \rightarrow (\sim\sim a).$$

It is one of the expository defects of the *Begriffsschrift* that Frege does not announce his axioms. He does say, at the beginning of his section II, that 'a small number of laws' (the axioms) 'contain all of them' (the theorems), but the reader finds the axioms only by searching through a long series of sample derivations. His rules of inference have to be found the same way; they are

Modus ponens: from theorems *B* and *B* $B \to A$ *A* derive the theorem *A* (for any formulae *A, B*). *Substitution:* from theorem *A* derive the result of substituting, for each occurrence of a variable *x* in *A*, a formula $\phi(x)$.

Since it is very easy to confuse a rule of inference with a theorem of logic—for example, *modus ponens* can be confused with the theorem $b \to ((b \to a) \to a)$—Frege let his readers down badly by not making these rules explicit in section II. It seems clear that he did understand the difference between a theorem and a rule of inference. In his section I he discusses the idea of a 'mode of inference' and mentions *modus ponens* in particular. However, this was not clear enough for the logicians of his time, and they were still confused thirty years later (see, for example, the indiscriminate mixture of axioms, rules of inference and rules for the construction of formulae in Whitehead and Russell's *Principia Mathematica*, vol. I, part I, section A*1 [9.41]).

Frege offers no explanation for his claim that all laws of logic are consequences of his axioms. In fact for prepositional logic this is not difficult to prove, though proofs did not appear until around 1920. The claim is much more remarkable for his system as a whole, which is a logic of properties and relations now known as *predicate logic*. (Here 'predicate' is used as a synonym for 'relation', and a property is a special case of a relation.) The consideration of relations is the second, and major, difference between Frege and Boole.

As we know from his analysis of the concept of number (pp. 261–3 above), Frege recognized that reasoning about properties and relations was fundamental to mathematics. He therefore decided to build the formulae of his logic from atomic formulae such as

P(x) '*x* has property P'
R(x, y) '*x* and *y* are in relation *R*'

etc. All mathematical statements can be built from such atomic formulae with the help of the equality sign, =, the universal quantifiers, $\forall x$ ('for all x'), $\forall y$ ('for all y'), etc., and the connectives $\to$, ~ of prepositional logic. The task then was to find all the laws of this logic. Frege claimed that they could be obtained as theorems from the prepositional axioms 1–6, plus the following rules and axioms specific to predicate logic.

$\to$ *introduction rules:* from theorem *A(x)* derive $\forall$; from theorem $\forall x A(x)$ derive $B \to A(x)$ (when *x* does not occur in *B*). *Axioms:*

7 $B \to \forall x A(x)$, where f is any formula
8 $c=c$
9 $(c = d) \to (f(c) \to f(d))$, where c is any letter not in f.

Quite amazingly, he was right! However, this is a deep theorem, first proved by Gödel [9.25], and it is doubtful that Frege fully understood the meaning of his claim, let alone knew why it was true. It was enough that he had captured logic in a system, of axioms

and rules of inference—proving theorems *about* such a system was a task for a later generation of logicians.

A FEW CLOUDS ON THE HORIZON

In the last decades of the nineteenth century, mathematicians enjoyed a period of satisfaction with the foundations of their discipline, rather like that enjoyed by their colleagues in physics (before the discovery of relativistic and quantum effects). Geometry and analysis had been reduced to the theory of real numbers, the real numbers had been reduced to sets of natural numbers, and nearly everybody was satisfied with the natural numbers. If Frege's work had been generally known the satisfaction could have been even greater (despite Frege's personal objection to the arithmetization of geometry), because everything was wrapped up in his logic of classes. However, few were granted a glimpse of this mathematical heaven, because Frege remained in obscurity until the turn of the century. Then his logic became generally known only because Bertrand Russell found something wrong with it.

The background to Russell's discovery was this. In 1891 [9.12] Cantor introduced the general diagonal argument which shows that any set *S* has more sub-sets than members, as we saw on pp. 257–61 above. This obviously implies that there is no largest set, but it has a more serious implication: *there is no set of all sets*. If there were, it would be the largest set, by definition, yet the set of its sub-sets would be larger. Thus it is contradictory to suppose that the class of all sets is itself a set. This was the first of the so-called 'paradoxes' of set theory. A similar paradox, involving the class of all ordinal numbers, was published by Burali-Forti in 1897 [9.8]. Cantor did not discuss the paradoxes in print, but he suggested a possible resolution of them in a letter to Dedekind in 1899.

> a multiplicity can be such that the assumption that *all* of its elements 'are together' leads to a contradiction… If on the other hand the totality of elements of a multiplicity can be thought of without contradiction as 'being together', so that they can be gathered together into '*one* thing', I call it a *consistent multiplicity* or a 'set'.
>
> ([9.13], 14).

In other words, to avoid contradictions, some classes should not be regarded as sets. This in fact is the solution favoured today, but at the time it was not clear how to recognize the inconsistent sets. Russell's contribution was an analysis of the 'set of all sets' which made its inconsistency more obvious.

Recall from pp. 257–61 how the diagonal construction is applied to a set *S*, with members *x* and sub-sets S_x paired with the members. One constructs the diagonal sub-set *D* of members *x* such that *x* does not belong to S_x. Then *D* differs from each S_x with respect to *x*.

Now if *S* is the set of *all* sets *x*, then each subset *y* of *S* is also a member of *S* and we can pair *y* (as a sub-set) with *itself* (as a member). The diagonal set *D* then consists of all

sets *y* such that *y* does not belong to *y*. Consequently, *D* differs from each set *y* with respect to the member *y: y* belongs to *D* if and only if *y* does not belong to *y*. But *D* is itself a member *y* of the set *S* of all sets, so *D* has the contradictory property of being different from itself.

This is how Russell came to discover the inconsistency of the set *D* whose members are the sets that do not belong to themselves. Of course, its inconsistency is obvious once one has thought of it. Each of the two possibilities

(1) *D* belongs to *D,*
(2) *D* does not belong to *D,*

implies the other. However, it is not easy to see how to prevent logic from being infected by such inconsistencies, and for this reason Russell's discovery was a severe blow to Frege (see Russell [9.39], Frege [9.21]). Most of the classes Frege used to define numbers were inconsistent when regarded as sets, but if the logic of sets did not apply to them, what did? Evidently logic would have to be overhauled, taking the properties of sets into account, if inconsistencies were to be avoided.

Even if the paradoxical sets were successfully excluded, how could one be sure that inconsistencies would not later arise in 'indispensable' parts of mathematics, such as arithmetic and analysis? In view of the trouble arising from the diagonal construction, one had to be suspicious of any field in which it was applicable, such as the theory of real numbers.

Drastic cures for these ills were proposed by several mathematicians, especially those who had not gone along with set theory in the first place. Kronecker refused to accept completed infinities, and even denied the existence of irrational numbers. Poincaré and Borel opposed the use of 'self-referential' definitions. However, Hilbert probably spoke for the majority when he urged the construction of foundations to save as much as possible of set-theoretic mathematics. In 1900 [9.29] he presented a list of twenty-three problems to the mathematical community as tasks for the coming century. The first two were concerned with foundations, and focused on the real numbers:

1 *The continuum problem:* decide whether each infinite set of real numbers admits a one-to-one correspondence either with the set of natural numbers, or with the set of all real numbers.

2 *The consistency of arithmetic:* prove that no contradiction can arise from the axioms of arithmetic. (These axioms are essentially the basic properties of +, × and < normally assumed for real numbers, together with the least upper bound property.)

These two problems effectively exposed the two greatest difficulties in the nineteenth-century reduction of mathematics to logic. Firstly, the set concept was not clear. Between the simplest infinite set (the set of natural numbers) and the set of all its sub-sets (equivalently, the set of real numbers) was a gulf whose size and general nature was not understood. Secondly, it was not clear that mathematical concepts were correctly captured by axioms. The consequences of a given set of axioms were difficult to foresee

and they could conceivably include contradictions.

The answers to Hilbert's problems 1 and 2 obtained so far do not boil down to a simple yes or no. They reveal many aspects of the foundations of mathematics not anticipated in the nineteenth century. The picture is no longer as simple as it once seemed, nevertheless the general outline remains intact.

CHAPTER 10
Philosophy of biology in the nineteenth century

Jagdish Hattiangadi

THE PHILOSOPHY OF BIOLOGY

The emergence of biology as a unified subject

Students of history and of biology share a common delight: as they study the details of any subject, they find a fascinating diversity of cases which far exceeds any preconceived expectations. But that is not their sole delight. Some will also see unifying themes therein, with coincidences that beg for explanation and leitmotifs which please the aesthete. Some scholars choose to stress the diversity, perhaps even the perversity, to be found in events in history (or, in biology, of living forms). Other scholars may feel happier following the motto *e pluribus unum*.

There is no right or wrong to it, that one is a unifier and another a divider of forms. We ascribe these differences in scientific or philosophical temperament to individual style or taste: some like a tidy story and others prefer a wealth of detail. Nor is this a matter of respect or lack of it for detailed facts. A grand unifier may study facts painstakingly while trying to unify (perhaps bending the facts, or perhaps ruefully admitting failure) while the person with a predilection for detail may believe in it only in principle, leaving it to others to dig them up and record them. Those who grant that details are important may do so either to prove that they fit into a grand scheme or to disprove that very point.

This difference is, perhaps not unsurprisingly, more than a matter of style. It is also an issue of substance in the nineteenth century, both in history and in biology. It became a topical question whether there is meaning in unfolding events: whether history exhibits fundamental laws, and whether there is a grand design to explain adaptation among living things. Do some things just happen, or is everything determined by a deep plan? Philosophers and scientists alike were on both sides of this celebrated debate, and on each side there are examples of intellectuals of both temperaments. But the issue of substance was not merely a matter of temperament, it was a matter of doctrine, of theory and of the future direction of thought.

The main issue of substance which animates the philosophy of biology in the nineteenth century has its root in the seventeenth, in the difficulties faced by Galileo's mechanical conception of the universe. This conception of a world ruled by mathematical laws of motion, or mechanics, became the central feature of the so-called scientific revolution of the seventeenth century. It was proposed by Galileo consciously in opposition to the Scholastic conception of the universe, which was dismissed with Ptolemaic astronomy as false. Galileo proposed that it was superseded by the new Copernican solar system, and proposed his new mechanics to replace the older physics of

the scholastics.

The subsequent success of the mechanical conception of the universe cannot be equated with the success of any one of the mechanical systems proposed to describe motion. Galileo's laws were followed in turn by those of Descartes, Huygens, Newton, d'Alembert, Euler, Lagrange, Poisson, Laplace, Fresnel, Hamilton, Maxwell. At the end of the period we are studying there followed entirely new mechanical systems from Einstein (relativistic laws of motion) and Schrödinger and others (quantum mechanics). The accepted laws of motion keep changing, sometimes in matters of detail and at others in more fundamental ways, but the general idea of a mechanical universe conjoins consistently with any of them.

What is common to all the mechanical conceptions of the universe following Galileo is what they seemed to exclude: certain aspects of the universe which were readily understood as far back as in Aristotle's or even in Plato's accounts of the world seemed to be incomprehensible within a thoroughgoing mechanistic scheme. The existence of forms, the prevalence of purposes and the realm of morality seemed to lie entirely beyond the mechanical conception of the universe. If we regard mechanics as forming the basis of a new comprehensive philosophy to rival the old Scholastic philosophies (as modified from those of Plato and Aristotle), then form, purpose and morality had to be understood somehow as part of the new mechanical conception. But how? There is no ready explanation for the existence of any of these three. To resolve this difficulty there were two basic ways to proceed: with ingenuity we could develop mechanical models to reproduce the effect of forms, purposes and morality artificially; or we could devise a conception of the world in which form, purpose and morality are quite real, and wherein mechanics has a diminished role to play in our understanding.

A thoroughgoing mechanist could dismiss forms as residing in the eye of the beholder, or (invoking the medieval doctrine of nominalism) as residing in the act of naming. Purposes could be denied to all animals, and restricted to the human psyche, within which can also be located the free will, allowing us the luxury as moral beings, apparently denied to animals, of being naughty (domesticated animals being interesting exceptions). In this convoluted way the problems posed by forms, by purposes and by morality can be reduced to the mystery of the human mind. But having done so, we have only artificially isolated the recalcitrant Scholastic phenomena without having thus made any attempt at solving the problems posed for mechanists. The thoroughgoing mechanist such as Descartes who throws all recalcitrant Scholastic phenomena into the category of mind is no better off as a mechanist than the one who, like La Mettrie, regards all these phenomena as external, and explicable in material terms, without saying exactly how.

Interaction between two substances is ruled out by Spinoza's powerful argument that a substance is by definition autonomous, and hence cannot be affected by anything which is independent of it. The mechanical conception of the universe seemed to leave us with no option but to adopt one of these two alternatives: some form of materialism, or some form of idealism; we have either to seek an extension of mechanism to model and recreate the effect of the recalcitrant Scholastic phenomena or to subsume all material phenomena under the realm of ideas in a modified form.

A titanic debate was touched off between Newton and Leibniz just prior to the latter's death, which is found recorded in the Leibniz-Clarke correspondence [10.1]. Clarke, as

Newton's voice, describes a material world which is governed by mathematical laws, but which has many physical features for which there are no mathematical laws governing them. Newton's own view was that God acted upon the world from time to time to preserve it in its required form (the solar system, for instance, was unstable according to Newton, and continues without signs of collapse because God holds the planets constantly within their orbits). Leibniz, on the other hand, proposed a fully rationalist conception of the universe, in which everything and every event is determined by the Principle of Sufficient Reason. The world according to Leibniz consists of a community of spirits (monads) each of which is completely determined in itself by its own nature. Each interacts successfully with other monads (or appears to do so, since any monad's experiences of other monads are completely predetermined by its own nature) only because of the pre-established harmony by which God has established an order among all things (monads).

If we neglect the references to God, either because we no longer believe in any, or for those who still continue to do so because we want to restrict ourselves to natural phenomena, then the choice for us lies between these two schemes: Firstly, a world in which some things just exist and some events just happen without natural cause, and they have no natural explanation (Newton). Secondly, a world which is fully determined in its smallest detail, and in which everything and every event within it is determined by a Grand Design which pre-establishes an otherwise inexplicable harmony (Leibniz).

These two points of view—one materialist and the other idealist, one indeterministic and the other deterministic, one antithetical to Scholasticism and the other friendly to some of its features, one seeking to understand what can be understood only in terms of the laws of matter and motion, and the other seeking to understand everything in terms of a pre-established rational order—are not the only two possible ways to approach the subject. But they did seem to many to offer the two most reasonable alternatives. In biology in the nineteenth century, however, are to be found some new ideas which cut across these extremes. They resolved some of the difficulties which were raised within Galileo's mechanical conception of the universe.

Thoroughgoing mechanists who avoided the relegation of all recalcitrant Scholastic phenomena to the mind, but accepted instead that forms and purposes were to be found among the phenomena (in short, materialists), had to find a way to understand form, purpose and morality in a material world governed by mechanical laws. A lively discussion between materialists and their opponents characterizes what we may identify in retrospect as the condition of biology as it coalesced into a subject in the nineteenth century.

Biology or the science of life arose as a unified subject among the discussions between French materialists and their opponents in the last years of the eighteenth century. Buffon, La Mettrie, Lamarck and their free-thinking contemporaries conceived a unified science of life, or of biology. Such was the need for recognizing this new subject that it was quickly taken up by many scholars of different persuasion across the scientific world. There is no doubt of course that the unity of biology was strengthened by the remarkable but later developments in cytology, genetics and evolutionary theory all of which cut across earlier divisions within the previously known sciences of living things. The prior unification of the sciences of life depends on this: form and purpose are to be found

among all living things on earth, and barely outside of them. The need for a unified science of life arises out of the need to find mechanical models for these two categories of recalcitrant Scholastic phenomena, all of which seem to be found in and about living things. These issues are central to 'Modern Philosophy' as this is taught in universities to this day. If we take that as our cue, we may say confidently that the unification of biology was a philosophical attempt to solve some central problems of modern philosophy.

On mechanism and vitalism

The schism in modern thought between the thoroughgoing mechanists and those who sought to put mechanism in its proper (and diminished) place in the grand idealist scheme begins with the clash between Newton and Leibniz. Unlike the seventeenth century, the eighteenth marks a deepening separation between natural philosophy and moral philosophy. By the nineteenth century this division became established. The word 'philosopher' came to be reserved for an apologist for idealism or perhaps an opponent of thoroughgoing mechanism in any form, and the expression 'scientist' came into use for the thoroughgoing mechanist who followed the experimental method of investigation. These two professions came to inhabit different parts of the university, and came to adopt different curricula, and thus and only so were able to keep the peace.

The mechanists adhered to three things: some form of the laws of motion to understand everything in the world; a conception of scientific method as experimental and inductive; and a healthy scepticism about Scholastic issues which were dismissed as superstitious.

It is an unfortunate fact that heated debates between scientists on the question of how to accommodate form and purpose within mechanism often led them to accuse one another of becoming unscientific. Two schools of thought exist within the group of thoroughgoing mechanists early in the nineteenth century concerning how to accommodate purpose in nature. One group sought to explain it by a special life force (attached to a kind of fluid, vital matter); another group hoped to explain it entirely in terms of other known forms of matter and force, such as the magnetic, the electric, the chemical, etc. The first sought to identify all living forms by an ingredient common to them, and the other sought to understand life in terms of organization (of the organism) from ordinary or inert matter. In principle either of these ploys might have been true (or of course neither might be true). As it happens, by the end of the nineteenth century the odds had swung in favour of the latter point of view, and in the twentieth century, whatever a scientist accepts she will regard vitalism as an intellectual oddity. Nevertheless, in the nineteenth century it would be premature to describe vitalism as unscientific as is done all too often today.

One of the unfortunate terminological ambiguities of this debate lies in the description of the opponents of vitalism as 'mechanists'. In a certain sense, a vitalist is also a mechanist who happens to believe in an additional element with a force much like magnetic or electric forces as they were conceived at the end of the eighteenth century. The mechanists were, therefore, not necessarily the only mechanists in that conflict of opinion, if by mechanics we mean the well known laws of motion accepted at the time as governing all matter.

Galvani's experimental and theoretical contributions were regarded as unscientific by

Volta late in the eighteenth century, but we may wish to differ in our assessment today. Perhaps Galvani was not correct in arguing that since the severed leg of a frog had been separated from its organisation (i.e. within the previously live frog) its twitching when probed by two metal prongs shows that there resides in the severed limb of the frog the principle of living matter. Perhaps Volta was right that this was not even a credible argument. But if it had not been for Galvani's argument, would Volta have sought to show that the twitch in the severed leg of a frog arose from the ordinary metals separated by the ordinary acidic fluid therein? Would he have otherwise looked for an apparatus to duplicate his model of a schematic form of a frog's leg being probed by two metal prongs, by inventing the voltaic pile? And would we have discovered current electricity, or the decomposition of water by electrolysis, or any of those remarkable things in physics and chemistry which followed Volta's invention of the pile and the discovery of the electric current?

Moreover, the methods used by vitalists could be and often were thoroughly experimental. Bichat made an excellent case for vitalism by conducting detailed studies of anatomical phenomena. Perhaps it is this more than anything else which led Claude Bernard, the great physiologist and methodologist, to recognize some fifty years later that while the experimental method needs preconceived ideas, it needs also a healthy scepticism (see pp. 292–5 below). Between the time of Bichat and Bernard, the tide seem to have swung against vitalism in physiology, though the full demise of vitalism had to await the twentieth century. The debate between vitalists and mechanists is a fine example of a thoroughly scientific controversy, in which experimental results and good arguments played an important role in the eventual outcome. As the difficulties for vitalism mounted and those for mechanists diminished, the tide of opinion swung against the vitalists. It is frequently but not invariably true that predominance of opinion among experts is a good gauge of the strength of the case made for and against the opinion, and in this instance the correlation seems to be quite good.

The factors which led to the decline of vitalism in the nineteenth century lay both within and without biology. In physics, there was an eighteenth-century consensus that the various forces of nature were distinct, and that each of them emanated from a characteristic and dis-tinct type of matter. For example, physicists thought they had discovered electric fluids which supported electric forces, and magnetic fluids which supported magnetic forces, and caloric, which induced heat. This is quite compatible with a living material supporting a life force. But in the nineteenth century the growing experimental confirmation of the interchangeability of forces (or the unity of all force, later redefined and identified as 'energy') came to undermine the vitalist idea of a special force shared by all and only living things. Within biology, arguments leading to the demise of mechanism had much to do with the rise and predominance of physiology as opposed to anatomy in the study of form. The close connection between physiological function and evolution in Darwin's account eventually made vitalism an outsider to science as Darwin's views, and their improved descendants, came to occupy centre stage in biology.

Although vitalism had its share of friends and opponents in the nineteenth century, it was only after Darwin's conception of evolution by natural selection was grasped that vitalism came to fall in favour very generally. The heated debate over the merits of

Darwin's theory of evolution by natural selection, however, was not between two versions of mechanism as was the case between the vitalists and the so-called mechanists. The issue debated by Darwin was the very different one philosophers had raised as the problem of design. He provided us with a mechanistic alternative to a grand design, or a pre-established harmony, or to some form of idealism. If we regard the French materialists' location of forms and purposes in matter as basically correct (in contradistinction to interactionists who find them in the mind), then we may say that Darwin's theory of evolution by natural selection solves the mind-matter problem (or the mind-body problem) of the Cartesian philosopher.

On biology as a development of the science of Galileo

When Leibniz proposed his idea of a divinely pre-established harmony, he had in mind the extraordinary coincidence that two monads which 'interact' have complementary experiences. In his account, two monads have two aspects of the same world. Each monad determines its own inner nature, and two 'interacting' monads might well have not been co-ordinated, and thus they may fail to 'interact' at all. (They may not possess aspects of the *same* world.) But in creating the universe, God created the best of all possible universes, and thus created a universe in which everything which exists and every event within each monad is there for a reason: were anything other than as it is, this would have been a different possible universe and therefore a universe inferior to this one. This being the best of all possible universes it determines for us what there is in every minutest detail—a determinism as complete as can be imagined—based on the assumption that anything else would not have sufficient reason to exist.

It is a remarkable fact of the history of ideas that Leibniz, the author of modern determinism (i.e. the Law of Sufficient Reason), was forgotten as its true author by the early part of the nineteenth century. Instead, the determinism invented by Leibniz is attributed to Newtonian mechanics. Perhaps it is not so surprising that this is so, after all. As Koyré expresses it:

> the world-clock made by the Divine Artifex was much better than Newton had thought it could be. Every progress of Newtonian science brought new force for Leibniz's contention: the moving force of the universe, its *vis viva* did not decrease; the world-clock needed neither rewinding nor mending.
>
> The Divine Artifex had therefore less and less to do in the world. He did not even need to conserve it, as the world, more and more, became able to dispense with this service.
>
> Thus the energetic God of Newton who actually 'ran' the universe according to his free will and decision, became in quick succession, a conservative power, an *intelligentia supermundana,* a 'Dieu fainéant'.
>
> Laplace, who, a hundred years after Newton, brought the New Cosmology to its final perfection, told Napoleon, who asked him about the role of God in his *System of the World:* 'Sire, je n'ai pas eu besoin de cette hypothèse.' But it was

> not Laplace's *System*, it was the world described in it that no longer needed the hypothesis God.
>
> ([10.4], 276)

But if Leibniz's determinism had taken over the Newtonian system of the world, it was not by providing mechanism with a new pre-established harmony. Laplace's determinism is one in which the particles at a given time, with their positions and momenta, determine once and for all the future and past states of the world; but this is not any explanation for the existence of forms or purposes (real or apparent) other than in the form of an unencashable promissory note.

The positions taken on these issues by scientists in the nineteenth century are varied and complex. The variety spans many intermediate forms between the two extremes which are represented here as mechanism and teleology. In the nineteenth century, both philosophers and scientists had become determinists. Only the form of determinism separated the two. The mechanists had come to adopt *physical determinism*, a determinism by mechanical forces alone, whereas the philosopher followed Leibniz in seeing in the system (or harmony) of the world such things as forms, their essences, purposes and purposeful beings (spirits). All of these were found by the philosopher in a simple 'common-sense' examination of the world. The pre-established harmony that was once postulated between minds or monads was now postulated to explain the adaptation of life forms. In this manner the pre-established harmony came to be regarded as a grand design in which physical organisms were adapted one to another. Even the description of development in an organism, in the work of von Baer, for instance, shows allegiance to both a mechanical perspective and a ideological perspective, tempting some modern commentators to call it 'teleomechanism', though this term would also apply to theologically inclined strict mechanists of the period as well (e.g. the geologist Hutton).

William Paley likened a living organism to a watch: if we were accidentally to find a watch, would we not postulate a watchmaker? The wonderful way in which all of the parts of the watch fit together allows us to infer that there must have been a watchmaker. In much the same way, the extraordinary manner in which living forms are adapted to their very particular surroundings, and often unable to survive in certain very slightly changed surroundings, suggests a designer. But it is not the existence of a designer which is the problem, but of a design or a plan. Many mechanists were faithful believers. They might still find a pre-established harmony to be unpalatable, given the success of modern mechanical science.

The existence of forms on earth had thus taken a particular twist late in the eighteenth and early in the nineteenth century: the fact that Scholastic forms are evident among phenomena is embarrassing enough for modern science. But the extraordinary coincidence that the various forms were uniquely fitted or adapted to their surroundings made them a double embarrassment to a mechanist. In order to respond to this challenge, Lamarck proposed his theory of evolution, in which all living forms metamorphose into other forms as they strive to make best use of the environment. Over the ages, thus, the various forms come to fit their surroundings with all the appearance of design, without a designer. (Other precursors of evolutionary theory and/or metamorphosis, include David Hume, Erasmus Darwin and Goethe.)

There were two difficulties with Lamarckian evolution: the concept of 'striving' was still a difficulty for a thoroughgoing mechanist. But this was not such a difficulty if one were also the kind of thoroughgoing mechanist who might be called a 'vitalist'. A more fundamental difficulty than that was a methodological flaw which arose in the usual defence of its main thesis. We turn to this difficulty of the theory of evolution, which was solved by Darwin.

Darwin's reconciliation of scientific metaphysics and method

Newtonian mechanism was not merely a set of ever-changing mathematical laws of motion; it came also with a distinctive method. Newton espoused an experimental method, which was both championed and practised with great success in many fields of science, old and new. The success of modern science was attributed to the adoption of Newton's experimental method, which enjoined a close study of the facts and a repudiation of all hypotheses. If we study the great debate between evolutionists before Darwin and their opponents concerning evolution, we find however that it is their opponents who were clearly scientific in their treatment of phenomena.

The celebrated debate in 1830 in the French Academy between Geoffrey St Hilaire, who defended Lamarck, and Cuvier, who ridiculed evolutionary theory, was a clear defeat for the evolutionists. Cuvier was a remarkable comparative anatomist. He had minutely studied the skeletal structure of a great many animals. On the basis of measurements he was able to establish ratios between skeletal limbs of a great variety of species. The minute and exhaustive studies of bones allowed him to reconstruct entire skeletons from a few fossil bones, sometimes from a single bone. Cuvier came to be regarded as the Newton of comparative anatomy, for such were his accomplishments in that subject.

In 1812, Cuvier had come forward boldly to assert that a study of the fossil record for different ages revealed that the earth had entirely different species from time to time inhabiting it. This evidence, he claimed, was compatible only with the catastrophic destruction of species and subsequent creation of a new collection of living forms during successive ages on earth. The facts he collected left him no other choice that he could imagine but cycles of destruction and special creation.

The evolutionists (e.g. Lamarck or his follower Geoffrey St Hilaire) could not challenge Cuvier's claims about the existence of these very different species in successive ages on earth. Cuvier's scientific method was too rigorous to allow that counter-attack. His techniques continue to be useful in palaeontology and comparative anatomy even today.

The best that an evolutionist could do was to suggest a possible mapping between species in one age and the next to show how one set of species might have metamorphosed into an entirely different one in the intervening period between two fossilizations. But so far apart were the species in different ages that the suggested pathway from one form extant in one age to one extant in another was sometimes fantastic. Evolutionists seemed to be dreaming up their models of change, where the hard-nosed scientist who studied the established facts would be fully on the side of Cuvier, the consummate observer of minute and detailed facts about anatomy in different

species.

For a philosopher of biology this debate is instructive not only because we now admire an idea that was once regarded as an unscientific speculation. It is also instructive because it is a clash of opinion between an ingenious metaphysical solution to a dilemma of Newtonian mechanics and a rigorous application of Newtonian method. The facts are, as they were then known, clearly investigated by Cuvier in a scientific manner. The evolutionist, on the contrary, appears to be a dreamer, a myth maker. The Lamarckian hypothesis defended by Geoffrey St Hilaire seems to be methodologically flawed, because it is an hypothesis (of the kind that Newton would not feign), and not an experimentally established statement, such as Cuvier's.

This clash of opinion is of seminal importance. Lyell formulated a 'uniformitarian' geology in contradistinction to Cuvier's catastrophic theory of the history of the earth. This clash changed the way in which uniformitarians and evolutionists approached their subject. The vicious attack on evolutionism on methodological grounds made subsequent uniformitarians and evolutionists nervous for decades about proposing hypotheses.

Darwin would not publish until he had investigated a great many particulars, perhaps more than absolutely necessary for the purpose of promulgating or defending their views. Darwin himself, whose evolutionary theory was of a different kind altogether, nevertheless immersed himself in the study of minute details of living things before coming forward with his views, which made his work both immensely richer and much less accessible to contemporaries than it might have been. Some controversies following Darwin's writing may be attributed to a lack of understanding of its main features, which were sometimes not clear to everyone, so great was the mountain of factual evidence in which it was lost. But an echo of Cuvier's earlier critique remains to this day: the fossil record, they say, is too incomplete to warrant evolutionary theory. The case for evolution cannot be made with so many gaps in the evidence. In the methodological developments of the nineteenth century it became evident that this demand is too great to make of any theory. Suffice it to say that the fossil record cannot support Cuvier's view either. If evolution is fantastic, then repeated extinction and creation are equally fantastic, without further evidence.

The critical feature of the evolutionary theory of Geoffrey St Hilaire and Lamarck which made it unsatisfactory is that this form of evolution did not allow for the extinction of species. Darwin's theory of evolution by natural selection does. The fossil record from one age to the next may be very different; and it may be futile to seek a one-to-one correlation between a species in one age and its descendants in another. Darwin suggests that even if most species in an age become extinct, a few which survive will produce all the variations which populate the next age. To take a popular example, it would be futile to look for an evolved successor today to every dinosaur which once roamed the earth. But there may well be one form *(archaeopteryx)* from which have evolved all the birds of today. Cuvier believed in mass extinction during the ice ages, and Lamarck in no extinction but only evolution. Darwin's theory is successful because it allows for almost complete extinction, and for evolution as well. Darwin's theory of evolution by natural selection postulates that there is a large amount of small variation in offspring. His proposal of blind variation combined with natural selection resolved the scientific and metaphysical issue of how form and purpose may arise—or may seem to do so—in a

material and mechanistic universe.

In one theory, he was able to defend the mechanistic conception of the world in a manner which was compatible with detailed study of fact. Newtonian method and Newtonian metaphysics were reconciled, and a major philosophical problem for Galileo's science was solved.

There is nowadays some confusion about the form of gradualism which is necessarily entailed by Darwin's theory and a form of catastrophism which is compatible with it: Darwin's theory is often described as gradualist in the sense that there are no catastrophes in the history of the earth. This form of gradualism is not appropriately attributed to Darwinian theory. The hypothesis that the extinction of a very large number of dinosaur species in a very short period of time by the catastrophic event of a meteor striking the earth is certainly not a critique of Darwinian theory. But the evolution of subsequent life-forms would be described by a Darwinian as descent from the surviving life-forms then extant, and this evolution would be gradual in the specific sense that the evolution would depend on small variation within species and their differential advantages. Whereas Lyell's geology denied the assumption that there are regular catastrophes, Darwin's theory describes how to do without periodic bursts of creation *de novo*. On Darwin's account, the evolution of species does not show leaps of creation, though it may well undergo rapid destruction of species in what may be described as catastrophes.

Two of the three Scholastic phenomena which could not be fitted into mechanistic theory were reconciled with it in Darwin's model. Forms (species) were described as mutable, but apparent at a given time; and the appearance of a great purpose or a grand design was also feigned in nature by the almost adaptive character of living forms which had been naturally selected in their environment in competition with variations which become extinct.

Continuing issues in the philosophy of biology

After Darwin successfully promulgated his theory of evolution by natural selection, an entirely new set of issues in the philosophy of biology came to light which were only dimly realized before.

Form and species

One of these issues concerns the classical idea of form. There may be a certain sense in which the mechanical conception of the universe challenged the idea of forms as the basis of all knowledge. Certainly, in some subjects in which mechanics was successful, forms ceased to play an important role. Many were the subjects, however, which resisted the advent of mechanical theories. The study of form in animals, plants and minerals (particularly crystals) left forms as a fundamental category for our knowledge.

In classifying species of plants, for instance, Linnaeus and Buffon provided rival schemata. Buffon's nominalist scheme was more general and philosophical, whereas that of Linnaeus, which stressed the essential qualities of species, was found much more useful in the practice of classification. Whichever system of classification one adopts, it is necessary for the practising natural historian, in order to classify things according to

their form, to presuppose that each species *has* a characteristic form, which may be captured in a typical specimen. Abnormal individuals may be found, of course, but the natural historian had to guard against choosing one of them as a specimen, which difficulty prompted Buffon's doubts about essential properties. An elaborate methodology had been developed to pursue natural history to respond to these concerns, the recounting of which falls outside the scope of this essay.

Darwin's theory of evolution by natural selection undermines the theoretical basis for this enterprise. Species, according to Darwin are not fixed but constantly changing. The normal situation is an abundance of variety in offspring. Thus in any species the characteristic form is not one but a multiplicity. Are there such things as species at all? (This is not quite the traditional problem of natural kinds and realism, though perhaps related to it.)

Darwin did not deny that an examination of the flora and fauna around the earth would yield a knowledge of identifiably different species. As a young man he delighted in collecting beetles. He did not need to be reminded that identifying forms is what makes the practice of natural history possible. His claim is a historical one: Darwin envisaged living organisms as belonging to a single tree. As the branches fanned out, some lines would come to an end (the forms would become extinct) but some would continue to flourish and would produce numerous varieties. Given a cross section of time the tree would project on a plane the characteristic grouping together of living things into species, genera, etc. as we find these in our records. But there are two provisos: Firstly, there are always some variations, and these are the source of evolutionary change. Secondly, over time, we recognize that species are mutable, and organisms from one species will be seen to have a common ancestry (and therefore share formal similarity) with the most remote of living organisms if only we are willing to go back far enough on the tree of life.

Darwin's theory eats its cake and has it, too. Species have characteristic properties more often than not, because the process of natural selection may well isolate a form of life as a species. This is what makes Linnaean natural history possible. But within any species there are many small variations, which will, in the course of time, speciate. Because species change in this manner, each existing variation has equal right to be regarded as characteristic of the species—or better still, it is the variety which characterizes the species. So Buffon is perhaps right after all in denying the existence of essences to living forms.

This conception of mutability challenged the idea of 'sorts' or 'kinds' as fundamental to our understanding of living organisms. In the theory of collections or aggregates or classes, it is possible to take any aggregate and regard it as a class. If any collection is a class, is there anything special about a species considered as a class? Is there some way in which it is natural, and not artificial?

From the old conception of morphology, it is only their form which binds similar organisms into a species. But when we consider Darwinian evolution, a species must be understood as a class of organisms which share the ability to generate common offspring. Thus we find in Darwinian theory a criterion for describing a class, when it is a species, as a natural kind. There are no doubt difficulties with this. For one thing, inability to generate offspring may be due to separation in time or by geography, which leaves it an open question whether two separated groups belong to the same species when they do not

generate common offspring, even though we may suppose that they could. On the other hand some combinations of animals may have only sterile offspring, or have offspring which are sterile after one or two or more generations. For all these and still more reasons the notion of a species has become both richer and more troublesome since Darwin. The criterion of form or essence to identify specimens, however practical and useful, is usually undermined by the existence of variety, and has been seriously undermined as a fundamental tool of biological thought.

Quite recently, this issue has been raised again under the slogan 'species as individuals', i.e. the idea that any one species is not a class of objects similar in some respect but an organic unity. This twentieth-century discussion seems to contribute little to what Darwin had already considered apart from obscuring the perfectly good notions of class and of individual. The theory of classes allows any collection to be also considered as an individual if we so wish; one might even wish to say that that is its whole point. Considering a species as an organic unity does not deprive it of its status as a class of organisms, any more than the class of cells within an organism is denied status as a class because they are all part of one organism. In both cases the defining property of the relevant class may be a historical one. All (or almost all) the living cells in the body of Georg Cantor have the property of having descended from one fertilized egg from his parents. They form a class none the less, as defined by that property, and Georg Cantor was an individual all the same.

History and determinism

Another fundamental issue of interest to philosophers to emerge from evolutionary theory is the conception of an 'open' history. Darwin's account of evolution included an idea of small variation in great abundance which has been variously described as 'blind' and 'random'. The inability of the environment, or of the organism, to direct the variation in the offspring is a very fundamental feature of Darwinian evolutionary theory. In order to distinguish the first view which was proposed by Darwin from a theory which allows organisms to have offspring which inherit the good acquired characteristics of the parent, the latter is often called 'Lamarckian'. Darwin himself vacillated between giving Lamarckian and what we may wish to call Darwinian accounts of adaptation. Climate-induced or environment-induced variation would be a third variety, which we may wish to call Lyellian evolution, to commemorate Lyell's views on it in his *Principles of Geology*.

What is interesting from a philosophical perspective about Darwin's distinctive theory (even if he sometimes used other theories also) is that in his account there is an element of chance in the evolution of species which cannot be eliminated. A chance event here and now could have a profound influence upon the course of the future history of life on earth. Indeed, the entire history of life is a history of many chance events which produce the appearance of a pre-established harmony (or what is more neutrally called 'adaptation').

It may seem at first that this is a peculiarity of biology that it raises chance to such an important level of fundamental principle, though we have seen it repeated latterly in thermodynamics and quantum mechanics. Although Darwin was not technically a

statistician, his conception of the biosphere was a fundamentally statistical one. His theory gave the statistical view, itself adumbrated earlier in the nineteenth century, considerable scope for development, although this development had to await the 'new synthesis' of Darwinian theory of selective fitness with Mendel's theory of genetic inheritance, and Waismann's theory of the eternal or at any rate long-living germ line.

Among nineteenth-century philosophers, Peirce is perhaps the only philosopher to adopt this indeterminist consequence of Darwinian evolution. There are many philosophical problems concerning indeterminism, statistics and probability, and chance that are of interest to a philosopher of biology, though only in forms evident in the twentieth century.

Methodology

When Darwin wrote his *Origin of Species*, there was almost universal agreement that any scientific theory, to be successful, must describe the world as fully deterministic. The indeterministic theory of Darwin with a prominent place for chance within it creates a methodological difficulty. Whether it is a methodologically satisfactory theory or not can be asked while assuming that a theory must fit the model of theories in physics as then conceived. In the nineteenth century this was not as great an enigma as it became in the twentieth, when methodologists frequently worried about the methodological status and explication of Darwinian evolutionary theory.

In the nineteenth century, and indeed to this day, the central methodological difficulty raised about Darwin's theory of evolution by natural selection is that the record of facts (i.e. fossils) is incomplete. Darwin's theory may be described for that reason as unfounded, or poorly founded. Alternatively we may dismiss the methodology which demands so much of Darwinian theory or of any other, for that matter, as an unrealistic methodology to adopt.

Compared to methodologies propounded in the nineteenth century, theories of method in the twentieth are much more varied and much less demanding. Foundationalism is in doubt today more than ever. It would be a mistake, however, to think that Darwin's theory had a great deal to do with this change. All the evidence seems to suggest, rather, that methodology has developed more in response to problems in mathematics and in physics, and less in response to those in biology, even though the present scepticism concerning foundations fits Darwinian science extremely well.

Although the influence on methodology of reflections upon the development of evolutionary theory is minimal, the same is not true for reflections on the content of evolutionary theory. Darwin was among those who realized that his theory implied that all life including human life has evolutionary origins. In his *Evolution of the Emotions in Animals and Man*, Darwin sought to extend his theory explicitly to human feeling. We also know from his diaries that he regarded human intelligence and some critical ideas to have been inherited, too. In fact a case can be made that Darwin was a follower of Whewell until he became a Darwinian in 1839 when he realized that a substitute for what Whewell had called fundamental ideas (which are not derived from experience) could be understood as having been inherited from our simian ancestry [10.3]. An evolutionary epistemology promises to be one of the most fundamental and profound philosophical

consequences of Darwinian evolutionary theory, though what it is exactly remains undecided.

Morality

The mechanical conception of the universe still fails to accommodate one class of Scholastic phenomena, concerning morality. Where evolutionary epistemology is clearly an interesting subject with much to teach us, evolutionary morality is, like a mechanistic conception of purposes in the seventeenth century, still enigmatic. Whereas Darwin's account shows how to do without a grand design, and how to explain the existence of forms among living organisms, there is in evolutionary theory as yet no satisfactory theory of the existence of morality.

There is of course ample room to account for the fact of the existence of mores among groups of people. Just as we can study different animals to study their mating, nesting or feeding behaviour, so too we can observe humans in different groups and study them moralizing. This might lead us to think that we have an evolutionary understanding of morality if we have some explanations of how they come to acquire their moralizing habits, but that would be a mistake. The characteristic feature of morality is not that we behave in some way, or moralize in some way, but that we regard some behaviour as immoral or wrong even as we practise it. What needs to be understood is how it comes about that some things are wrong, or immoral, and not just why we so regard them.

The understanding of morality from an evolutionary perspective certainly had a controversial and well publicized attempt in the nineteenth century. One of Darwin's most ardent admirers, Herbert Spencer, proposed a doctrine called Social Darwinism. In this doctrine the lesson for us from competing living forms as Nature evolves (red in tooth and claw), is that the fittest survive, and the weak perish. Applied to the social sphere it led to what was roundly attacked as an amoral and callous view of human society. Its popularity with some despicable political movements in the twentieth century (e.g. with the National Socialists, or Nazis) has left many intellectuals with a horror of social theoretical biologists.

But the issue of morality is squarely one which remains unresolved within the Galilean revolution, and, however distasteful and misguided Spencer's Social Darwinism, one must give him and other intellectuals of the nineteenth century credit for recognizing this as a fundamental difficulty of modern science which needs to be addressed. Indeed it is because an entire society under the Nazis, in the name of their entire society, espousing Social Darwinist slogans, was so immoral as to practise systematic murder and genocide that we have to ask not only how individual immorality is possible but also how collective immorality is possible. No account of how actual mores are acquired or propagated can explain this.

As opposed to Spencer, who tried to extract a morality from the natural course of events as he interpreted them, G.E.Moore argued early in the twentieth century that any attempt to derive a claim that something must be so based on the claim that it is so, is a fallacy (what he called the Naturalistic Fallacy). His argument is that of whatever is described as a fact we may still ask meaningfully whether it is good that it is so. Since we can always meaningfully ask that question, we cannot identify the meaning of 'good'

with what is the case. Moore's argument purports to make the realm of morality (and of norms and prescriptions generally according to later philosophers) independent of the realm of nature. How it may have come about that these realms are independent is a difficulty for naturalists.

The situation at the turn of the twentieth century was that naturalism in ethics was opposed to normativism, and the matter was unresolved, and so it remains to this day.

METHODOLOGY OF BIOLOGY

Origins of the subject and of some terms

Whether there was any philosophy of biology in the nineteenth century is debatable: there is as good reason to deny it as to assert it. The expressions 'philosophy of science' and 'philosophy of biology' were invented in the nineteenth century by William Whewell. Were we to rely on that alone we would have to allow that there is such a subject by 1840. But if we were to seek practising philosophers of biology, none comes to mind, at least none who would self-consciously describe any of their work as belonging to such a field. The name invented by Whewell for this field came to designate something which clearly exists only in the latter half of the twentieth century, with some writings of T.Goudge and J.H.Woodger. Later, the writings of D.Hull, still later followed by a host of interesting writers on the subject (Ghiselin, Ruse, Wimsatt, Sober), all of whom would be happy to describe their relevant works as belonging to the philosophy of biology.

To a modern historian of the philosophy of biology in the nineteenth century this creates an interesting question of choice: lacking a clearly defined field in the nineteenth century, one could dismiss it as non-existent. This implies that there is no philosophy of biology until concerns arising out of logical empiricism (a unique intellectual movement of the twentieth century) led to the birth of this subject. But this would belie the fact that many of the issues taken up today did arise earlier, as we have seen, however different the context in which they arose in the nineteenth century.

The strategy which suggests itself is to pick out issues in the philosophy of biology today and to seek to present these very issues as they once emerged or developed in the nineteenth century. This is the strategy which has been adopted in this chapter. The obvious difficulty with this strategy is that it may be prone to anachronism: how do we prevent our criteria of choice of issue from imposing our own concerns for those of the past? To a certain extent this is unavoidable. In writing a history of philosophy in the nineteenth century, or in writing a history of the subject of history, there would be a generally accepted sense *at the time in the period being studied* that some things were within the field, even if today they were to be classified as belonging elsewhere. Issues in psychology or in sociology, for instance, which arose in the early part of the nineteenth century would have to be classified as part of philosophy because they were so regarded then. In this sense we cannot find a bench mark or a criterion of what would have been part of the philosophy of biology in the nineteenth century as seen by a contemporary then. But to be forewarned was to be forearmed.

The issues of the philosophy of biology may be divided into two kinds:

methodological, and substantive. There is, as I shall soon suggest, an overlap there as well.

The substantive questions within nineteenth-century biology which are of concern to philosophers of biology today may be classified into three categories: those connected with problems of evolutionary theory and related developments; those connected with the problem of reduction of life sciences to physics and chemistry; and those related to the understanding of human beings in the light of modern biology. There are of course a host of issues which may fit within or across these categories. All these issues were already controversial in the latter part of the eighteenth century and continue to attract interest to the present day, and some of them have been sketched in the first section above.

In studying the methodology of biology in the nineteenth century one could include the commentators on science (Whewell, Bernard) or those involved in the practice of scientific research who exhibit or are obliged to pronounce upon method (Cuvier, Pasteur, Darwin): the discussion of methodology in the practice of scientific research is generally a sign of a clash between defenders of different theoretical perspectives, all of whom attempt to use methodological considerations to buttress their respective cases.

The second kind of methodological pronouncement is usually controversial, because it is made in the interests of controversy. The substantive issues in biology which stand out today as worth discussing are just those that were once the subject of controversy. Practical methodology is therefore closely bound up with the same substantive issues that we have identified as part of the philosophy of biology in the nineteenth century.

There may also be a connection between the writings of abstract methodology and the controversies of the nineteenth century: Whewell's work may be related to the controversies arising from substantive issues in physics (empiricism versus *a, priori* knowledge, for instance) and Bernard's from those in medicine (anatomical as opposed to physiological considerations in medical research). Nevertheless, the form of these self-consciously written methodological tracts differs from the others: the former must be taken literally as methodologies. The others are more casual and less systematic remarks uttered in the interests of other argumentation. We may sometimes disregard the methodological apologia and prefer instead to analyse the science in action. For this reason there has been included, in the section below, a brief account of two methodological treatises of the nineteenth century of particular interest to the philosophy of biology.

Since the unification of biology is an important part of the story recounted here, perhaps some comments are in order about each of the subjects of history, philosophy and biology as they are found in the nineteenth century. The first two of these subjects trace their origin to an era which is at least as early as that of the ancient Greeks—Herodotus and Socrates respectively being cited as their originators. (The words were invented then, but it is always possible to suggest that there were predecessors in or around ancient Greece, or in another civilization prior to the Socratic invention of the word.) Philosophical history, a particularly influential conception of time and events in human history, seems to be an especially noteworthy product of the nineteenth century (Hegel, Comte, Marx). It is an open question which will not be taken up here what direct or indirect influence philosophical history might have had on biology.

Unlike philosophy and history, biology is a comparative beginner. It is recognized as a

unitary and integral subject worthy of a separate designation for the first time only late in the eighteenth century. Many of the fields which are now part of biology as we understand it have a hoary history: zoology, botany, physiology, anatomy, as well as hosts of sub-disciplines like ornithology, entomology. They were well developed subjects for a long time before they came to be regarded as component parts of a single subject identified as the science of life, or of biology. It is an interesting fact about this new subject, biology, that there is a philosophy of it according to us. In contrast, we would find a philosophy of entomology or of botany to be unnecessary without further argument. It seems that there is a unity to biology which warrants a philosophy of it. Perhaps the thesis that the unity of biology is a unity of philosophical approach, prompted by the fundamental problems of modern philosophy, is not the whole story. But if it is part of the story, it still makes philosophy much more central to the development of biology, and vice versa, than is generally supposed.

Two important methodological treatises

The origin of the expression 'philosophy of science' may be traced to Whewell, who proposed it in his book *Philosophy of the Inductive Sciences, Founded upon Their History* (1840). Book IX is entitled 'The Philosophy of Biology', which is part of the philosophy of science.

> The advances which have, during these last three centuries, been made in the physical sciences;—in Astronomy, in Physics, in Chemistry, in Natural History, in Physiology;—these are allowed to be real, to be great, to be striking: may it not be then that these steps of progress have in them something alike?—that in each advancing movement there is some common process, some common principle?

Then a little later he says, 'if we can, by attending to the past history of science, discover something of this common element and common process in all discoveries, we shall have a *Philosophy of Science*' ([10.5], vi). In the opening section of Book I, philosophy of science is said to offer nothing less than a complete insight into 'the essence and conditions of all knowledge, and an exposition of the best methods of the discovery of all truths'.

It is evident that a philosophy of science would include at least a methodology, and an informed analysis of the history of science to exhibit that methodology. In addition it would have to exhibit an insight into all real knowledge—a tall order indeed. Whewell's own writings are remarkable for the insight he exhibits into diverse subjects and their history, which few have matched.

But when we turn to his account of the philosophy of biology, the reading is disappointing (but no more than Mill, Comte or Spencer). There he lists five schools of biological thought, and a cursory account of some developments in physiology. We do not find any especially remarkable insight into the essence and conditions of biological knowledge, or even of the particular methods which may have made them successful. Instead, we find that when he can he applies the paraphernalia of a philosophy arrived at

from the study of physics and mathematics to biology—his conception of a fundamental idea not derived from experience, for instance, is inspired by Kant's conception of *a priori* synthetic judgement, introduced to show how mathematical knowledge is possible.

Searching for a nineteenth-century figure who actually studied what Whewell may have called the essence and conditions of biological knowledge and who reflected upon the process of discovery to extract some insight from it, we find only one book which merits our attention, Claude Bernard's classic, *An Introduction to the Study of Experimental Medicine* (1865).

Claude Bernard was one of the great physiologists of his day. His most memorable achievement perhaps was the discovery of the internal environment of animals, which allows for an explanation of the comparative autonomy of some animals even though they remain in constant interaction with environment. He had also made numerous and brilliant discoveries in physiology before that, such as the function of the pancreas, animal glycogenesis, experimental production of diabetes, the existence of vasomotor nerves, which are mentioned among other discoveries in Paul Bert's introductory eulogy ([10.2], v-xii).

Claude Bernard's work does not address biology as an integral subject. He deals exclusively with physiology, and mentions anatomy. But his work is so centrally in philosophy of biology as we now understand it that it cannot be left out of account.

Bernard argues forcefully for the need to study not just form as in comparative anatomy but function as well. And he suggests that in order to do so it is necessary not just to observe organisms but to experiment with them. What, we may ask, is the difference between observation and experiment?

Bernard provides us with one of the most lucid and brilliant accounts of experimentation and experimental reasoning ever given. He begins by distinguishing the process of experimentation from that of observation. We take observation to be a passive gathering of facts, where in experiments there is an intervention into the process being studied, 'a variation or disturbance that an investigator brings into the conditions of natural phenomena' ([10.2], 5). But in distinguishing an observation from an experiment and both from experimental reasoning, he notes that the objective of an experiment is to understand a phenomenon from a perspective under our own control, 'to reason experimentally, we must usually have an idea and afterwards induce or produce facts, i.e. observations, to control our preconceived idea'. ([10.2], 20).

Bernard's account of the experimental method in observations as well as in experimentation is anything but passive. 'Of necessity, we experiment with a preconceived idea. An experimenter's mind must be active, i.e. it must question nature, and must put all manner of queries to it according to the various hypotheses which suggest themselves.' And his account of the experimental method is this:

> the metaphysician, the scholastic, and the experimenter all work with an *a, priori* idea. The difference is that the scholastic imposes his idea as the absolute truth which he has found, and from which he then deduces consequences by logic alone. The more modest experimenter, on the other hand, states an idea as a question, as an interpretative, more or less probable anticipation of nature, from which he deduces consequences which, moment by moment, he confronts

with reality by means of experiment.

([10.2], 27)

Bernard's brief for a study of experimental medicine is an attempt to bring science to bear on a subject which he saw then as

> still in the shades of empiricism and suffers the consequences of its backward condition. We see it still more or less mingled with religion and with the supernatural. Superstition and the marvellous play a great part in it. Sorcerers, somnambulists, healers by some virtue of a gift from Heaven, are held as the equal of physicians. Medical personality is held above science by the physicians themselves; they seek their authority in tradition, in doctrines or in medical tact. This is the clearest of proofs that the experimental method has by no means come into its own in medicine.
>
> ([10.2], 45)

The conception of experimental medicine proposed by Bernard suggests that experimentation has exactly the same character whether we experiment on inorganic chemicals or on living tissue. Thus he argues that there is just one method for the study of all living and non-living things, which is in direct contrast to the claims of some vitalists that living organisms provide exception to the general rules governing the study of dead (non-living) matter.

While Bernard argued forcefully and lucidly for the unity of experimental method, he also pointed out that living objects must be treated differently from inorganic things.

> So far we have been explaining experimental conditions applicable to both living and inorganic bodies; for living bodies the difference consists merely in the greater complexity of the phenomena…. But in the behaviour of living bodies we must call the reader's attention to their very special interdependence; in the study of vital functions, if we neglected the physiological point of view, even if we experimented most skilfully, we should be led to most false ideas and the most erroneous deductions.
>
> ([10.2], 87)

Living organisms must be treated as a harmonious whole. And in this manner he argues for the need to do not only comparative anatomy but experimental medicine as well.

The greatness of Bernard's suggestions lies not only in the profound changes that he foresaw and helped advance in the profession of theoretical medicine but also his genuine contributions to methodology, or to the philosophy of science as this subject had been conceived by Whewell. Bernard's analysis of the sceptical doubt which is used by the experimenter without letting it get out of control, his defence of the need for preconceived ideas together with the injunction that we must be ready to abandon them as soon as nature turns recalcitrant—all these are so remarkable in capturing the essence of scientific method that it is one of the few books on methodology which continues to be read as profitably now as when it was first printed.

Compared to Bernard's brilliant work, there is nothing else of interest in the nineteenth century, and perhaps even since then, in the form of a sustained methodological treatise on the topic of experimental method in biology.

NOTE

My thanks to Professor Margaret Schabas and Mr David Clingingsmith for their comments and assistance with the paper; the errors which remain are of course my

CHAPTER 11
The separation of psychology from philosophy

Studies in the sciences of mind 1815–1879

Edward S.Reed

> An age which demands free inquiry, pushed without fear or compromise to its legitimate conclusions, turns up an Epicurus or a Hobbes. In one which likes to put up at a half-way house, there will be no lack of a Dugald Stewart or a Mackintosh, to provide it with comfortable entertainment.
>
> Thomas Love Peacock, 'The epicier' (1836)

THE IMPOSSIBLE SCIENCE

Traditional metaphysics

The consensus of European opinion during and immediately after the Napoleonic era was that psychology as a science was impossible. This was not the position of a few retrograde thinkers but was the thoughtfully articulated opinion of the best placed academic thinkers. Much of what we now think of as psychology and philosophy emerged from attempts to overcome these well developed arguments against the possibilities of a scientific psychology.

There is an important terminological shift during this time as well. In Locke's day, the English terms 'natural philosophy' and 'moral philosophy' were used in parallel to mean, roughly, what we would now call natural science as versus social science. By the middle of the eighteenth century a host of other terms were being used to denote all or part of 'moral philosophy', such as the Latin 'psychologia' (both empirical and rational) and the pseudo-Greek 'pneumatology'. Within Scottish philosophy the phrases 'intellectual powers' and 'active powers' of the mind gained some currency. By the turn of the century, however, the word 'metaphysics' was increasingly used to denote much of what we would now call psychology (although terms like 'moral philosophy' were still common as well). Around 1815, the linguistically sophisticated poet Shelley wrote that 'Metaphysics is a word which has been so long applied to denote an inquiry into the phenomena of mind that it would justly be presumptuous to employ another [although] etymologically considered it is very ill adapted to express the science of mind' (Shelley also spoke of Kant as a 'psychologist'). At about this time Maine de Biran and Schopenhauer were using this term in a similar way, and a generation later one finds the young Charles Darwin also using 'metaphysics' to refer to psychological inquiry.

As Napoleon swept across Europe academic theorists increasingly argued that 'metaphysics' (psychology) was not a science, or at least that it could not be an empirical science in the same way that physics or chemistry could. The two most important sources of this broad consensus were literally situated at opposite ends of the continent: Immanuel Kant in East Prussia and Thomas Reid in Scotland. It is no exaggeration to say that these were the two most influential psychologists between the French Revolutions of 1789 and 1830. Their views on psychology were widely taught, analysed and discussed. I shall call the position that emerged under this influence 'traditional European metaphysics'. Ironically, traditional metaphysics is *not* a position to which either Reid or Kant would have subscribed; nevertheless, it is a set of views which arose in large part because of the influence of Reidian and Kantian arguments.

Neither Kant nor Reid was against the study of psychology—on the contrary, both were acute practitioners of this discipline. Nevertheless, they both had strong reasons for attacking any pretensions put forward for treating psychology as a science. Kant and Reid took Newtonian mechanics to be the model empirical science; arguing that explanations in terms of patterns of efficient causality conforming to empirically determinable laws are essential to real science. Both Kant and Reid presumed such laws would be expressed mathematically, and that controlled experimentation (perhaps mixed with observational modelling as in astronomy) was the proper method for deriving the laws.

Kant argued that the various claims about the nature of the human mind or soul are impossible to evaluate in this scientific manner. He attacked the 'rational psychology' then popular in Germany for claiming to be able to prove such propositions as 'the soul is unitary and simple'. Instead, as Kant showed in the antinomies of his first *Critique*, diametrically opposing views of the soul could be sustained with equal rational force. In his 'anthropology' Kant endorsed a kind of natural historical model for psychology, using observational techniques to illustrate how different people(s) have developed, and how they react in diverse situations. Kant's 'critique' was a novel discipline, or method, intended to undercut all pretensions to a science of metaphysics beyond this sort of observational procedure.

Reid's attack on psychology as science had a different origin from Kant's, but ended up in much the same place. Responding to what he called the 'way of ideas'—and in particular to what we would see as Lockean psychology—Reid objected to what he saw as an inadequate appreciation of the difficulties of accounting for intentional psychological states on the basis of sensory data. Reid argued that psychological capacities, such as the ability to perceive external objects (which Reid saw as central to all mental powers), could not be explained as causal outcomes of physical stimuli affecting the mind or the body. He tried to show that all such accounts either violated the concept of efficient causality, or were not explanatory, or both. The causal effects of, for example, light on the retina are one thing, and the sensory awareness of light (visual sensations) another thing, and the visual perception of objects yet a third thing. The widespread claim, originating in Descartes and running through Locke, the *philosophes* and beyond, that the first caused the second which caused the third, were simply what we would now call category errors—because physical stimuli cannot be the efficient causes of mental states, nor can sensory (non-intentional) states be the causes of perceptual (intentional) states. Reid occasionally flirted with Berkeleian semiotic explanations of the

stimulus-to-sensation transition, and also dabbled with occasionalist interpretations of the sensation-to-perception transition. But, in his mature works on *The Intellectual Powers* and *The Active Powers*, he most often argued that these transitions cannot be causal and simply do not fit available models of explanation.

Reid did not argue against the distinctions among the concepts of stimulus, sensation and perception; on the contrary, it was Reid who sharpened these three concepts into modern form—thus setting the stage for many a nineteenth-century dispute. However, Reid strongly stated that explanation of the causal interrelationships among these three kinds of events was not possible, and he objected to claims that such interrelationships had to conform to patterns of cause and effect. For Reid the ultimate fact in psychology was ideological: God had so arranged our bodies and minds that upon receipt of a certain stimulus, our bodies felt a given sensation, and our minds conceived a particular perceptual belief. In an intriguing parallel with Kant's *Critique of Judgement,* Reid argued that the relationships among the various animal and conscious properties of ourselves is a part-whole relationship, contrived by a deity with the purpose of adapting us to the rest of his creation. Like Kant, Reid argued the need for a descriptive psychology, to elucidate the modes of this adaptation of self to world, but denied even the possibility of an experimental, causally based psychological science.

Both Reid and Kant left open a path to what we nowadays call, often disparagingly, a faculty psychology. Through natural history, anthropological observation, intuitive introspection, and other sciences' knowledge of creation, a descriptive psychology might be developed. Such a psychology would provide a taxonomy of mental capacities ('faculties'). This taxonomy could be correlated with medical or physiological knowledge of our bodies' capacities, although no causal explanation of the linkage could be given. Both Kant and Reid were willing to say, for example, that vision begins in the eye, but neither was willing to characterize the events in the eye or brain as efficient causes of vision. Although Reid and Kant left open the possibility of a faculty psychology, neither of them argued for such a psychology. In fact, both Reid and Kant were careful to warn against reifying descriptions of phenomena into substances or forms. None the less, and perhaps because Reid and Kant had left little for psychologically minded inquirers to *do*, their followers did often move in the direction of reifying psychological phenomena into faculties.

Victor Cousin: exemplary traditional metaphysician

The career of Victor Cousin (1792–1867) illustrates many of the features of what I am labelling the traditional European metaphysics of the first part of the nineteenth century. A proponent of an increasingly modified 'Scottish common-sense philosophy', Cousin was influential across the entire continent, and in America as well, especially through his writings in the history of philosophy. Alternately stymied and helped by political events in post-Napoleonic France, Cousin ultimately became the Minister of Education under Thiers in 1840, exerting a direct and powerful influence on higher education in France for the next generation.

Cousin taught primarily at the École Normale, where he began his lecturing career in 1813. In 1815, the premier exponent of Scottish philosophy in France, Royer-Collard,

chose Cousin as his substitute, a post he held until 1820. During this period, Cousin became interested in German idealism, especially the work of Schelling and Hegel, and he visited Hegel and others in the German-speaking countries. Thus was begun what Cousin called his 'eclecticism'—a philosophy which proposed to integrate the best of all previous philosophies. (It is an interesting and unsolved question why Cousin eagerly sought connec-tions between Scottish philosophy and Hegel's ideas, whereas Dugald Stewart at the same time professed to be completely baffled by Hegel.)

Cousin attacked the French Lockeans, from Condillac down to the ideologues, in a way reminiscent of Reid's critique. Reid argued that the Lockean (really Cartesian, but Cousin downplayed this) 'way of ideas' led to materialism. That is, argued Cousin, the notion that mental states are 'ideas' which are the effects of physical causes (stimuli and the impressions they make on our bodies and brains) makes no sense except on the kind of materialist interpretation given to it by Diderot or, worse, d'Holbach.

Cousin promoted these ideas in his lectures on eighteenth-century philosophy, and also in a separate volume, *The Elements of Psychology*, an immensely popular chapter-by-chapter duel with Locke's *Essay*. Although Cousin here endorsed Reid's critique of Locke, he was unable to articulate a complete and coherent version of Reid's alternative to Lockean epistemology. In particular, Cousin's account of Reid's theory of perception as direct (not based on either ideas or sensations) was very muddled, in ways that prefigure William Hamilton's disastrous version of Scottish philosophy. Most importantly, Cousin (who was followed in this by Hamilton, Mansel and others) tied Reid's everyday concept of perception into an almost mystical concept of intuitions of realities. Responding to Locke's attack on enthusiasm (*Essay*, IV, xix) Cousin endorsed what he took the Scottish school to be saying as a 'spontaneous intuition of truth by reason, as independent as possible of the personality and of the senses, of induction and demonstration'. Thus the common sense of the Scottish enlightenment became the enthusiastic intuition of nineteenth-century orthdoxy. What for Reid had been tied into the senses, based on experience, and not on reason, Cousin twisted into a quasi-mystical access to truth, with an eye towards religious and moral orthodoxy. It was to be his greatest contribution.

The success of traditional metaphysics—what Kant and Reid saw as an impossible science—was really quite impressive. Fichte and many others in German-speaking countries developed post-Kantian taxonomies of powers of the soul, and began to speculate about the mechanics of the soul as well. In France Reid's influence on Royer-Collard and Kant's on Maine de Biran defeated Lockean psychology even before Napoleon had met his Waterloo. Dugald Stewart's influence in Scotland (and around the continent as well) at this time was immense. In *The Encyclopaedia Britannica* of the 1820s, in the curriculum of faraway Harvard College, and all around Europe, in Paris, Naples, Vienna and elsewhere something like this metaphysical or faculty psychology was at the centre of the philosophy curriculum. The concert of European ideas about the mind was every bit as broad and strong as the concert of reactionary powers that ruled the European nations rigidly from 1815 to 1830. After 1830 the unity of support for traditional metaphysics began to erode, under the influence of new philosophical positions, and especially with developments in physiological and experimental analyses of neural and mental phenomena. Nevertheless, thanks to Cousin's eclecticism,

traditional metaphysics was still very much alive up to 1848. Although disagreeing about much else, the French-speaking, German-speaking and English-speaking proponents of traditional metaphysics increasingly endorsed psychological theories which made room for Cousin's intuitionism, a kind of sanctimonious transcendentalism which would have disturbed Kant and Reid. Nevertheless, this kind of intuitive psychology found a home in a broad array of writers: the right Hegelians, Cousin and his French followers, Whewell in England, Hamilton and his followers throughout Britain and the United States. Indeed, it is almost impossible to find a textbook of 'moral philosophy' or 'metaphysics' from this period that does not promulgate something akin to Cousin's intuitionism. James Mill's *Analysis* is a conspicuous and important exception to this rule, but it is probably not completely representative of the views of those who opposed traditional metaphysics, as I shall now explain.

Frankenstein's science: an alternative psychology

Try as they might, Metternich and his allies in reaction could not completely eradicate progressive thinking. Similarly, although the set curriculum of most academic institutions and texts followed a kind of popularized Reidian or Kantian psychology, there was at the same time a widespread, if non-academically-based, alternative psychology. To a great degree this oppositionist psychology was what might be dubbed a 'fluid materialist' position. This psychology had its roots in Franklin's two-fluid theory of electricity, and its branches in Mesmer's animal magnetism, Galvani's and Volta's exciting work on electric phenomena in animal tissues, and in Boscovich's reconceptualization of physical force. Increasingly, some thinkers were led to speculate that an understanding of electricity—or perhaps some other, subtler, fluid within the nerves—would unlock the secrets of life and mind.

Priestley was perhaps the earliest proponent of this materialist psychology—and was soundly attacked first by Kant and then by a mob organized by the British authorities to drive him out of the country. Above all it was Priestley who placed associationism (derived from Hartley) at the centre of materialist psychology, launching a tradition of psychologists and physiologists looking for associations among neural processes and pathways. Priestley however shied away from serious neurophysiological analysis of the mind (and called Hartley's attempt at such an analysis a failure). Thus it was Erasmus Darwin's *Zoonomia* (many editions and translations from 1792 to 1812) that properly launched a fluid materialist psychology. This text, which appears to have been widely influential across Europe, treated sensory impressions as the fluidic activity of nerves when impressed by stimuli, and went on to develop an elaborate associationist mechanism for psychological processes. In addition, Darwin here and elsewhere speculated about the possibility that electricity is the key to understanding not only neural processes but even life itself. For example, he reported on the experiments of Aldini (Galvani's nephew) in which dead flesh is 'reanimated' by the use of electricity.

A glimpse of the ideas involved in this oppositionist psychology is afforded by Mary Shelley's novel *Frankenstein.* First published in 1818, this novel emerged from Shelley's attempts to think through the implications of Darwin's psychology. Victor Frankenstein is a scientist in the mould of the elder Darwin: 'I was led to examine,' this character says,

'the cause and progress of th[e] decay [of living tissue]' and such studies helped him succeed 'in discovering the cause of generation and life'. But not only is life science capable of being studied causally, so is psychology. Mary Shelley follows Hartley and Darwin carefully in her description of how Frankenstein's android, abandoned by its creator, would develop psychologically. In the creature's original state, 'no distinct ideas occupied my mind; all was confused'. What confused the creature was a bewildering array of sensations. But some of the sensations were more pleasurable than others, and these captivated the creature's mind. The most powerful feelings were elicited by the creature's witnessing scenes of social intercourse among the family members upon whom it is spying: seeing the ageing father playing music for his daughter, the creature 'felt sensations of a peculiar and overpowering nature: they were a mixture of pain and pleasure, such as I had never before experienced'.

Shelley follows the materialist psychology of her day in seeing both language and morals as emerging from the association of weaker feelings with these powerfully strong sensations of social origin. 'I perceived,' says the android, 'that the words they spoke sometimes produced pleasure or pain, smiles or sadness, in the minds and countenances of the hearers. This was indeed a godlike science, and I ardently desired to become acquainted with it.' Such acquaintance is made by the creature's straining to associate names of familiar objects and people with their referents. Like her mentors, Hartley and Darwin, Mary Shelley did not try to explain how a creature limited in its experience to sensations could come to perceive the significance of such a thing as a pained countenance. She understood that even simple objects can have multiple names (such as the boy in the family being called alternately 'Felix, brother, or son') but was able to convince herself that the bewildering associations of sound and sense could nevertheless be worked out by a naive listener. But some associations are not so simple: the android discovers that it can hear the sounds of some words, even though it does not grasp their reference, words 'such as good, dearest, unhappy'.

To understand such words, the materialist psychologists argued, required experience with people and their ways. Here is the beginning of the great nineteenth-century conflict between an experiential, or empiricist, psychology and a nativist one. The standard metaphysics asserted that knowledge of good and evil, right and wrong was not based on experience, and certainly not based on the sensations of pain and pleasure; on the contrary, writers like Fichte, de Biran and Stewart held that we each have a kind of direct intuitive apprehension of right and wrong. Reid had warned that the Hutchesonian concept of 'moral sense' was incoherent—that an apprehension of good and evil could never be obtained by mere sensation. Reid's own response to this was to argue that morals were empirical (he spoke of moral judgements and moral perceptions, based on experience and intuitive—God-given—standards of conduct). Although this view influenced American thinkers, especially Thomas Jefferson, it appears to have been abandoned in nineteenth-century Europe even by followers of the 'Scottish school'. In its place was substituted the traditional metaphysicians' assertion of an innate, intuitive, apprehension of right and wrong.

The metaphysical mainstream shied away from Reid's empirical ethics for reasons well understood by the materialists, and well illustrated in the narrative of *Frankenstein*. If moral evaluation derives from experience, then certain repeated patterns of association

might generate moral monsters: people who get pleasure from and justify acts which the rest of us judge to be evil. At first, when his experience derives primarily from reading history, the android 'felt the greatest ardour for virtue arising within me, and abhorrence for vice' but these terms, as the android explains, should be understood only as 'relative…to pleasure and pain alone'. Hence, when it emerges that human beings cannot stand even to look at him, and that even his creator finds him horrific, the android develops an inverted morals: what destroys humans will destroy all his greatest pains, and is therefore the greatest good.

Contemporary critics detested this point of Shelley's book, and attacked her for promulgating a false morals, or an amoral position. 'Our taste and our judgment alike revolt at this kind of writing' said the *Quarterly Review*, 'and the greater the ability with which it may be executed the worse it is—it inculcates no lesson of conduct, manners or morality.' A psychology that treated humans as natural objects, that did not assume that humans were creatures with a transcendent soul—as did the traditional metaphysics—would end up offering a scenario of mental and moral development that looked frighteningly like the one in Shelley's novel. To make psychology into a science could threaten the moral fibre of society.

The suppression of psychology as a natural science

In evaluating the conflict between traditional metaphysics and the materialist psychological tradition, the modern reader should keep in mind that this battle often went well beyond the realm of ideas. Especially after the defeat of Napoleon, State and religious authorities (often the same people, and almost always the same bureaucracies) exerted enormous efforts to prevent dissemination of ideas like those of Erasmus Darwin and Mary Shelley. Censorship, the use of informers and highly active secret police forces were the norm in all European countries from 1815 to 1830. The authorities were on the lookout for fluidic psychology, in order to crush what they saw as 'pantheism', 'atheism' and 'materialism'—all assumed to be enemies of the status quo. A number of historians have argued that it was the emerging sciences of phrenology and mesmerism that were specifically under attack. I would argue that proponents of these ideas were attacked only in so far as they were seen as overlapping with the fluidic materialists. Once the second generation of Mesmerists gave up Mesmer's claims concerning the physical force supposedly at the root of mesmeric phenomena, once the second generation of phrenologists adopted a moderate nativism (especially in Calvinist Scotland), they were widely accepted.

In contrast to mesmerists or phrenologists, those who propounded the idea of studying life and mind within the framework of natural science were zealously prosecuted, even in the most 'liberal' of European states at this time, Great Britain. One of the most important cases of such repression is that of William Lawrence (1783–1867), a distinguished but radical surgeon (soon to be an editor of the insurgent medical periodical *The Lancet*, and later Surgeon to Queen Victoria). Lawrence was a follower of Bichat who believed that research on electricity and other physical forces would ultimately reveal the connection between neural structure and mental function, giving us a kind of natural science of the soul. Doctors should rejoice in this, Lawrence believed, because it

means that insanity is not a disease of the soul (only treatable, if at all, by moral suasion) but a physiological disorder, perhaps curable by medicine. In 1819 Lawrence prepared to publish a work explaining these ideas, his *Lectures on Physiology, Zoology, and the Natural History of Man*. After a brief period of publication, there was an orchestrated campaign against this book for blasphemy. Leading figures in the medical establishment asked the Royal College of Surgeons to force Lawrence to expunge the blasphemies and to desist from lecturing. Lawrence withdrew the book and lost his lectureship.

One of William Lawrence's patients, the husband of the author of Frankenstein, had even worse problems with State suppression of his philosophical and psychological ideas. In 1813 Percy Shelley had 250 copies printed of the first of his great dramatic poems, *Queen Mab*. Directly influenced by Erasmus Darwin's poetry as well as his theories, this poem included extensive prose notes, amounting to a series of essays on such forbidden topics as republicanism, atheism and materialist psychology. Shelley was explicit in his psychology in these essays, where Mary in her novel could only be implicit. He argued explicitly for treating humans as part of nature, and for seeing psychology, morals and politics, as sciences seeking causal laws: 'Were the doctrine of necessity false, the human mind would no longer be a legitimate object of science; from like causes it would be vain that we should expect like effects', but this is never true. A true psychology would see motives as nothing more than complex causes, and lawful patterns of cause and effect would then be discerned. Where we seem to see action without causes, he said, 'these are the effects of causes with which we are unacquainted.' This psychology would 'introduce a great change into established notions of morality…there is neither good nor evil in the universe, otherwise than as the events to which we apply these epithets have relation to our own mode of being'.

Shelley was always acute at seeing the implications of his philosophical ideas. One implication he took pleasure in emphasizing was that this new moral psychology would desanctify marriage, and legitimate divorce—an implication chosen to annoy his orthodox readers. Marriages, far from being made in heaven, are natural relationships, 'the worthiness [of which should be] estimated by the quantity of pleasurable sensation it is calculated to produce…. the connection of the sexes is so long sacred [only] as it contributes to the comfort of the parties, and is naturally dissolved when its evils are greater than its benefits'. Much of Shelley's more serious discussions of the implications of his psychology revolved around his vegetarianism, expounded at great length in the notes to the poem. Like Feuerbach and then the German materialists of forty years later, Shelley argued that the intake of food was a key ingredient in a person's constitution, and that proper diet was a basis not only for good physical and mental health but for the formation of progressive characters, capable of educating and reforming the world. Historians of philosophy have often noted, usually with scorn, Feuerbach's extreme materialist phase, with his claim that 'man ist was man isst' (people are what they eat)—but historians would be better advised to try to explain the widespread appeal of this doctrine throughout the middle of the nineteenth century than to make fun of it.

Shelley was attacked for both seditious and blasphemous libel, and his book banned. This was one of a series of events, which included the use of government spies to follow him and his friends and to read his correspondence, that ultimately led to Shelley's self-imposed exile from what he saw as a ruthless and tyrannical government. Shelley tried in

various ways to have the ideas in this book, or even parts of the book, published and/or reviewed with varying success. Finally, again, several pirated editions began appearing, including one from Richard Carlile, an important 'working-class' publisher and fighter for a free press. Bans and trials continued to be stimulated by this book, but the text was out of the bag. *Queen Mab* quickly became known as 'the Chartist's Bible'. Many a cobbler and cordwainer cut their philosophical teeth on Shelley's ideas, and his quotations from d'Holbach, Voltaire, Drummond, E.Darwin and Spinoza.

The battle between traditional metaphysics and psychology as a natural science was thus not an even one. The former had access to publication, pulpit and professorships; the latter risked prosecution, imprisonment, loss of positions and banishment. The rapid success and proliferation of materialist ideas across Europe in the wake of 1848 suggests that ideas like the first Darwin's and Shelley's were much more widely known and discussed than the printed records—especially the printed records of philosophical works which tended to be academically and ecclesiastically respectable publications—might suggest. Historians of philosophy need to know much more about what radical surgeons and poets were thinking and saying. It will not be easy to find out what these heterodox thinkers were saying because of the widespread use of police spies and informers, which inhibited people even in private correspondence, much less in publication. It is imperative that historians recognize that the decades following Waterloo imposed the tightest censorship ever seen across most of the European continent.

Here is one example of the mischief this severe censorship has caused to historians of ideas. It is widely believed that Spinozist ideas—especially those relating to pantheism and to psychophysical isomorphism—arose from theological discussions sparked by such 'left Hegelians' as Feuerbach and Strauss in the 1830s and 1840s. Supposedly the first 'serious' writing on Spinoza in nineteenth century England was G.H.Lewes's in the early 1840s, followed by the unpublished translation of *The Ethics* by Marian Evans (later 'George Eliot' and Lewes's spouse). But Lewes acknowledged hearing of Spinoza from discussions with Leigh Hunt in the 1830s. Leigh Hunt was one of Shelley's key literary contacts, and probably knew of Shelley's translation of Spinoza's *Tractatus*. Perhaps Spinoza's ideas, interpreted through the lens of a materialist psychology, influenced philosophical opinion in London well before reaching the 'broad reading public' or the conservatives in Oxford and Cambridge. (A similar story could be told of the dissemination of Spinoza's ideas in France in part via the writings of the radical poet Heinrich Heine.)

The iron grip of the concert of Europe began to be loosened in the 1830s. As we shall see in the next section, there was a corresponding increase in objections to traditional metaphysics in the years between 1830 and 1848. It is possible that some of these ideas were previously censored ones finally seeing the light of day, and it is also possible that some of these ideas were genuinely novel. Without extensive and careful research that includes examination of unpublished documents, and information about non-academic circles (such as working-class reading groups which were common in all the major British cities, and even in some continental cities as well, from 1820 on), it will be difficult to determine the path taken by novel ideas at this time.

THE BREAKDOWN OF THE OF EUROPEAN IDEAS

Emergent naturalism

Despite its widespread popularity, and despite the very real boost it received from the authorities, secular and sacred, traditional metaphysics was a relatively unstable theory for psychology. It is one thing to state that the analysis of the soul goes beyond the boundaries of the natural world, for the soul is a transcendental entity—but it is another thing to produce various analyses of psychological states, all the while protesting that certain modes of explanation do not apply. For example, Reid's denial that sensory impressions can or should be treated as the causes and sensory states as the effects of a single process simply had to strike any independent-minded physiologist as wrongheaded.

The rise of associationist psychological theories after 1820 should be seen in the context of attempts to naturalize aspects of traditional metaphysics. In particular, the associationists were dissatisfied with what they saw as overly general statements about 'laws' and 'dispositions' of the human mind. They wanted these replaced by what we would now call psychological mechanisms. This conflict is well illustrated in the different estimations of the state of psychology offered by Dugald Stewart and his erstwhile student, James Mill. Stewart's *Dissertation exhibiting a general view of the Progress of Metaphysical, Ethical, and Political Philosophy since the revival of letters in Europe* (which was prefaced to the fourth edition of the *Encyclopaedia Britannica* in 1819) offered a strong defence of traditional metaphysics. For example, in writing about John Gregory's essay of advice to physicians, Stewart explained that Gregory correctly emphasizes 'the laws of the union of the mind and the body and the mutual influence they have upon one another'. Stewart went on to caution, however, that

> it is only the *laws* which regulate the union between mind and body…which are here pointed out as proper objects of philosophical curiosity; for as to any *hypothesis* concerning the *manner* in which the union is carried on, this most sagacious writer was well aware, that they are not more unfavorable to the improvement of logic and of ethics, than to a skilful and judicious exercise of the healing art. (425)

Making a sense

One of the specific ways in which traditional metaphysics responded to the Kantian and Reidian arguments against scientific psychology was to invent a new sense. What Kant termed the 'scandal of philosophy'—and it is important to remember that by 'philosophy' he meant something closer to what we mean by 'science' than modern philosophy—was the inability to prove the existence of the external world. Reid was content to avoid proof in this matter, and merely to assert the plausibility of the existence of objects as an assumption on which science should be based. Here Kant went well beyond Reid and

investigated how such a proof might be developed, ultimately offering his transcendental arguments to make such a proof. The empirical world of causal interactions, of space and time, Kant asserted, could be proved to exist only if one assumed that the human soul *qua* transcendental creature participated in the construction of these phenomena. Thus Kant was what he chose to call a transcendental idealist but an empirical realist. The phenomenal world could be proved to be real, but only by hypothesizing a transcendentally active mind.

Naturally Kant's conclusions were resisted by many thinkers (whether his arguments were understood by these thinkers is a separate question). Just as Kant chose to make causality, space and time the central test issues of his work, so did the traditional metaphysicians who resisted Kant's transcendental idealism. In the first three decades of the nineteenth century several non-transcendental schematisms were offered to explain how knowledge of causality and space and time might be veridical. One group of arguments revolved around refining and extending the previously inchoate notion of a 'movement' or 'muscle sense'. A second group of arguments revolved around a novel idea of a 'sense of effort' or some sort of direct intuition of personal activity. Maine de Biran and Schopenhauer are the most important thinkers of the second group (some might put Fichte in this group as well). Destutt de Tracy and some of his followers in France, along with Thomas Brown, James Mill and their followers in Britain, make up the important members of the first group. (And there is some reason to suspect that Brown was heavily influenced by de Tracy.) It was the promoters of this new sense who did the most to set the stage for mid-nineteenth-century associationism.

What both these groups of thinkers held in common was the notion that non-transcendental forms of mental activity could be invoked to prove that our knowledge of the external world is reasonably veridical. The crudest form of their idea is the doctrine of 'resistance': that children learn the difference between themselves and the world by coming up against things that resist their actions as they move around. (Berkeley actually anticipated this part of the argument in several passages of his *Three Dialogues*.) Whether this resistance is detected through sense inputs deriving from muscular activity or from something preventing the proper carrying out of an action as willed, the cognitive result might be the same: knowledge of something that is external to, and undetermined by, myself.

Where the two groups of theorists diverge most sharply is on the nature of causation. The second group of theorists offers a kind of output-based theory, by emphasis in the mental output causing action. In contrast to the input-based theorists of muscle sense, these output theorists typically suggested that the human mind has a kind of direct, intuitive knowledge of its own causal power. Both Maine de Biran and Schopenhauer make this supposed intuition central to their metaphysics, arguing that it is through knowledge of our causal powers that we know ourselves as Kantian noumena, not merely as phenomena. Neither a transcendental schematism nor empirical associations need be invoked, these theorists claimed, to explain how we know this one species of causality, because it is known via a special kind of direct access.

This very dichotomy between input- and output-based theorizing raised the question as to what, exactly, is a sense? Could one call the direct intuition of personal causal powers a sense? Even Locke had decided to call such mental facts 'reflection' as opposed to

sense experience. In reflection there is no sense organ, aside from the cerebrum, and perhaps not even the brain is necessary for a person to detect his or her own mental activity, or so de Biran seems to have argued on occasion, unlike Schopenhauer. The idea of a muscle or a movement sense also raised a host of questions about what should count as a sense. If there is a separate sense based on our capacity to detect changes of tension in muscles, then how does one distinguish this sense from touch? E.H.Weber, in his seminal experiments on somesthesis in the early 1830s, argued that the only proper way to draw the distinction was to study touch in a completely passive hand or body part. But as early as the 1810s physiologists like Steinbuch in Germany, Bichat in France and Charles Bell in Scotland were exploring the possibility that muscles themselves, as well as skin, were sensitive organs.

In contrast to Weber, Charles Bell in his Bridgewater treatise on *The Hand* emphasized the co-ordination between movement and perception (as, later, did Weber's student, Lotze). It is striking that Bell's early concept of a nervous circle and complex co-ordination between activity and perception was among his least influential ideas. For nearly a century after Bell and Weber, research on touch meant research on the sensitivity of immobilized skin (in which the normal exploratory processes of touch are eliminated), and research on action meant studies of reflex functioning (in which the normal sensory adjustments of bodily parts are eliminated). The contrast between the widely accepted conception of the senses as passive channels of impressions and the natural activity of animals and people is still a fundamental tension in psychological theory.

While the output theorists offered a strong challenge to Kant's claim that noumena are unknowable, the input theorists' challenge was to Kant's doctrine of perception as resting on a transcendental schematism. In particular, associationist psychologists tried to develop intricate models of how sensitivity to muscular motion might provide them with the 'missing information'—just what they needed to explain how external objects are perceived in space and time. The model for how to do this was supplied by a Scottish traditional metaphysician who broke explicitly from Reid, and exerted enormous influence on the Mills and later associationists, Thomas Brown.

Thomas Brown (1778–1820) was the successor to Dugald Stewart in the Chair of Moral Philosophy in Edinburgh. He made his name as a young scholar by defending Hume's theory of causation when Hume was still a bogeyman in Scotland, and by attacking Erasmus Darwin's materialist psychology, and, a little later, phrenology. Brown's lectures on *The Philosophy of the Human Mind* (1820) were exactly that, his lecture notes, published posthumously and widely disseminated in Great Britain, France and the United States. (Brown preferred to spend his energies in the composition of bad poetry.) Although typically categorized as a follower of Reid, Brown was not, and explicitly acknowledged his deviations from Reid's philosophical positions. Brown did not think, as did Reid, that what we perceive are the external objects themselves.

> It is evident, that…the real object of sense is not the distant object, but that which acts immediately upon the organs,—the light itself, not the sun which beams it on us…. The reference to the distant sun…is the effect of another principle of our intellectual nature [than perception],—the principle of association, or suggestion…without which, indeed, our mere transient

sensations would be comparatively of little value.

(1.242)

For Reid the object of sense is always the distant object, and our sensations are different things entirely than our perceptions, so no amount of suggestion or association could turn them into perceptions.

One implication of Brown's sensationalism is that the young child will have to learn to distinguish self from non-self based only on sensations. A Reidian might acknowledge that learning is involved here, but the learning would be based on the Reidian assumption that even babies perceive external objects. It was Brown, above all others, who bequeathed to nineteenth century-century psychology one of its central problems: how can an infant come to perceive objects as external from and independent of itself, and how can it do so on the basis merely of sensations? 'There will be, in the first momentary state,' Brown explains, 'no separation of self and the sensation,—no little proposition formed in the mind, I feel, or I am conscious of a feeling; but the feeling and the sentient I, will, for the moment, be the same.' As Brown understood, once one accepts sensationalism, it is clear that in a childhood state 'we know as little of our bodily frame, as of th[e] material universe.' Luckily 'our muscular frame, is not merely a part of the living machinery of motion, but is also truly an organ of sense. When I move my arm, without resistance, I am conscious of a certain feeling; when the motion is impeded, by the presence of an external body, I am conscious of a different feeling' which arises only in part from touch. The other component of this difference in feeling is muscular, and it is from this that we get sensations of solidity—without muscle sense, touch would be nothing more than painful or pleasant feelings.

Having abandoned Reidian perception of real objects for sensationalism, Brown added this important new sensation: the feeling of solidity. It is from this, through intricate patterns of association, that he and his many associationist descendants chose to explain the origin of our perception of the external world. But in addition to a new sensation, Brown also brought in a new faculty, memory. To explain how feelings of solidity begin to be associated into perceptions of externality, Brown appealed to the infants' knowledge of a succession—'a feeling which necessarily, involves the notion of divisibility or series of parts, that is so essential a constituent of our more complex notion of matter [which notion is] that which has parts, and that which resists our efforts to grasp it'. Brown then elaborated this idea by imagining what sensations would be available to a baby feeling any object. There would be simultaneous feelings if more than one finger or body part touched the object. There would also be successive feelings as the hands moved over objects. And the pleasant or unpleasant feelings of touch would be correlated with different feelings of solidity, again both successively and simultaneously. Out of this successive series of feelings of hardness, Brown carefully constructed the idea of length, and from this he then constructed the idea of space. The infant, at first feeling its own fingers as they move, will come to associate the sensation of contact between fingertip and, say, palm, with a sequence of muscular feelings (this example comes from Hartley). This will be perceived, Brown claimed, as a certain distance. The next finger movement and contact, or the next hand movement and contact with a body part will be a different distance, and so on. Variants of this model of the perception of the external world are

found in numerous thinkers over the next century. Brown's was a crude theory, with many obvious difficulties. For example, if succession—time—can be detected at birth, why not space? Or, another example, how can babies decide that the feelings of solidity underneath their bottoms come from objects different from those in their fingers or hands, since the former are always co-present with the latter? Despite its crudeness, Brown's associationist empiricism had enormous popularity and influence—indeed, variants of this theory are still taught today.

Motor theories of mind

In addition to his important role in bringing associationism, sensationism and empiricism together, Brown also adumbrated a theory of perception that was widely influential, even among non-empiricists. Although he did not use this term (it is a twentieth-century neologism), Brown's 'motor theory of perception' was the basis for much later thinking about spatial perception and cognition. Reid had argued that perception (of external objects) was a fundamentally different psychological process from sensation (awareness of states of feeling). Following Brown, most nineteenth-century thinkers made a very different use of Reid's distinction between sensation and perception: sensations were to be turned into perceptions, via processes of association, memory and, later, judgement. Indeed, Brown asserted that 'Perception…is only another name…for the result of certain associations and inferences that flow from more general principles of the mind.' Brown essentially wanted to eliminate 'perception' as referring to either a special class of mental states or a specifiable psychological process, beyond that of association among sensations, a position that John Stuart Mill was to adopt without acknowledgement.

Brown is very explicit about his rejection of Reid's distinction, and his belief that sensations of muscular movement are the basis of all our knowledge of the external world.

> [I]n that state of acquired knowledge, long after the first elementary feelings in infancy, in which modified state alone, the phenomena of the mind can become to us objects of reflective analysis, certain feelings are referred by us to an external material cause. The feelings themselves, as primarily excited, are termed sensations, and when followed by the reference to an external cause, receive the name perceptions, which marks nothing more in addition to the primary sensations than this very reference. But what is the reference itself, in consequence of which the new name is given? It is the suggestion of some extended resisting object, the presence of which had before been found to be attended with that particular sensation, which is now again referred to it. (353)

Brown goes on to make it clear that this 'suggestion' involves the association of any sensation (visual, tactile, auditory, etc.) with a muscular sensation—the feeling of resistance to our action—so that perception as such (knowledge of external objects) would be impossible without the muscular sense. 'In all but one class of our sensations, then, it is evident that what Dr Reid calls perception, as the operation of a peculiar mental faculty, is nothing more than a suggestion of memory or association.' Furthermore,

Brown argues that even feelings of resistance are not so much perceptions in Reid's sense as a kind of 'intuitive belief in the externality of the causes of our feelings of muscular motion.

James Mill codified, organized, and extended Brown's theory. (In explaining Brown's ideas I have doubtless given the impression that Brown's theory was clear and organized, but in fact it is buried amidst hundreds of pages of rather turgid prose.) Mill enunciated what he considered to be several principles of association, and importantly introduced the concept of a *fused* sensation. By this he meant an association of two or more sensations that, through repetition and/or intensity, comes to be felt as a single sensation. This concept of a fused sensation he applied to many cases of our perception of external objects, arguing that our apparently visual awareness of external things, for example, is based upon a fusion of visual with muscular and tactile sensations.

What is most striking about these muscular sensations is that we never seem to be conscious of them. Unlike smells and sights, we never appear to have the kind of feelings hypothesized by Brown and the elder Mill. James Mill suggests that feelings of rest, discomfort and stretching might be instances of muscle sensations, but he is aware that 'there are some muscles of the body in constant and vehement action, as the heart, of the feelings attendant upon the action of which we seem to have no cognisance at all'. Still, 'this is no argument' against their existence, and the lack of consciousness can be explained by habitual inattention. As late as 1869, when he was editing his father's book for republication, Stuart Mill spoke of this as 'the paradox… of…feelings which are not felt'. And, indeed, Stuart Mill realized this important inconsistency within associationist sensationalism. Supposedly all our knowledge derives from sensations, and supposedly sensations are the simplest modes of feeling, and supposedly feelings are simple mental (conscious) states. But associationist accounts of how sensations become perceptions all require that many of our sensations go unnoticed. This applies to vision and other sense modalities as well as to muscular sense; for example, we are rarely conscious (if ever) of the changing hues of visible objects as we change position with respect to them and the light source, although these sensations are supposedly the basis of our seeing the colour of the objects in the first place.

Alexander Bain (1818–1903) is typically treated as an associationist follower of the Mills, who developed a more empirically based account of perception and volition. However, Bain in fact modified Brown's and the Mills' theory into something much closer to a modern motor theory of perception. Recognizing some of the problems of the sensory associationism found in Brown and James Mill, Bain emphasized not so much muscle sense as motor activity. Bain focused his thinking on the spontaneous activity of animals and infants, not on their receptivity to impressions, muscular and otherwise. He was perhaps the first scientist after Whytt to emphasize the importance of overall muscle tone and the permanent closure of sphincter muscles as evidence of a psychologically important fact.

Bain's is thus the first true motor theory of perception, emphasizing that perception itself is dependent upon prior motor activities. It is only as a consequence of our activity that muscular feelings arise, and it is only because of these muscular feelings that we perceive external objects. To use another anachronistic term, muscular sensations are, for Bain, 'response-produced sensations'. In addition to Brown's notion that muscle sense

gave us information about resistance, Bain claimed two more kinds of information for muscular feelings: feelings of effort (as in effort of attention), and feelings of the rate of muscular contraction (a kind of effort of bodily attention). From his motor theory of perception, Bain derived his conception of what a belief is. A belief is not only a mental state for Bain but also a state of preparedness to act. In fact, what a belief is is that upon which one is prepared to act.

Another important motor theorist of the mind was William Carpenter (1813–85). A distinguished comparative anatomist and student of the 'Philosophical Anatomist' Robert Grant, Carpenter was turned down for the Chair of Medicine at Edinburgh in 1842 for his Unitarian beliefs. In 1844 he was so widely suspected of having penned *The Vestiges of Creation*—an infamous evolutionist tract—that he had to issue a denial. (Later he befriended the true author of that work, Robert Chambers, the Scots polymath.) Carpenter explicitly saw his work in neuropsychology as modernizing and improving upon Gall's conception of brain and mental science. Like most serious phrenologists, Carpenter was a strong moral crusader (Carpenter was especially associated with the crusade against drinking alcohol) but, unlike the phrenologists, Carpenter followed Hartley (the Unitarian hero) and not the Scots philosophers (the Presbyterian heroes).

Whereas earlier writers (like Erasmus Darwin and James Mill) had emphasized the need to bring Hartley's associationism up to date, Carpenter attempted to bring Hartley's approach to volition and to moral judgement into mid-nineteenth-century science. His most important writing on the mind is his *Mental Physiology* (1874), which grew out of a large section on the topic in his earlier (and very influential) *Human Physiology*, which went through a number of editions in the 1840s and 1850s. In many ways, Carpenter was a transitional figure. Carpenter even called his work 'physiological metaphysics' on occasion, and his emphasis on 'character' and its formation as central to psychology echoes the writings of Gall, Spurzheim and Combe as well as the ideas of Hartley.

Whereas Bain used the motor theory of mind epistemologically, Carpenter tended to use it ontologically. He regarded 'all the physical forces of the universe as the direct manifestation of the Mental force of the Deity'. Just as Lotze made an analogy between God's creation of the cosmos and our soul's ordering of the mental 'microcosmos', so Carpenter found the idea that our notion of power derives from something like Bain's motor sense an interesting parallel to his speculations on the 'correlation of natural forces'. 'It is to me very interesting to find the two lines of argument—the one starting from the correlation of the Physical, Vital, and Mental forces…the other from our own subjective consciousness' as running together.

In particular, Carpenter found one important parallel between the Deity and our souls in his concept of volition. Although God receives information from the entire universe, and must act (if she is truly omniscient) on the basis of all the relevant information, her acts are not constrained by this information. The same is true with our souls or wills, which receive all relevant information, but may act in independence of incoming impressions. Like Bain, Carpenter saw that any activity would produce new impressions, but, unlike Bain, Carpenter distinguished between impressions that simply activated nerve channels in the spine or brain in a reflex-like fashion and impressions that required conscious deliberation prior to action. These latter were cases of free action, Carpenter insisted. Despite this emphasis on free action, he also noted that a great deal of habitual

action did not require such deliberation, and could be handled ‘automatically’ (Hartley’s ‘secondary involuntary acts’). Just as God designed the universe to act on its own most of the time, so our minds are capable of allowing our bodies to act automatically in many instances, on the basis of what Carpenter dubbed ‘unconscious cerebration’. This concept of ‘unconscious cerebration’ requires there to be reflex-like mechanisms that are both cerebral and unconscious which Carpenter called ‘cerebral reflexes’.

Carpenter’s application of this concept of cerebral reflex (a concept he credited to Thomas Laycock) was unusual and important: he used it to explain Braid’s results with hypnosis, and other examples of what are now called ‘dissociated states’. If hypnotists can distract a person’s conscious attention, or cause them to relax that conscious attention, then hypnotists may be able to engage habitual cerebral reflexes that otherwise would not be activated. For example, a hypnotist might arrange for a person to believe that the solid tennis-ball-sized object in front of him or her was an apple, when in reality it was an onion. And, if their automatism were truly activated, the person might well bite into the ‘apple’ even though they would never do so when normally conscious. In other words, Carpenter distinguished two forms of ‘ideomotor action’. In the first, one’s idea is conscious and freely deliberated, which is ordinary voluntary behaviour; in the second, the idea arrives from some source other than deliberation, nevertheless setting off the ‘cerebral reflexes’ so that an action follows. Carpenter suggested that this second kind of ideo-motor activity might be invoked to explain many of the ‘spiritualist’ phenomena then in vogue, such as messages on Ouija boards. Thus Brown’s ‘suggestion’ was transmogrified into Carpenter’s concept of ‘suggestibility’: that some people are especially susceptible to this second kind of ideo-motor action, and that they themselves can act out an unconscious idea, or be made to act out such an idea by a properly trained hypnotist. This theory of suggestibility was to have a great impact on the classical era of psychoanalysis, through Charcot and Binet to Breuer and Freud.

THE BRIEF LIFE OF NATURAL METAPHYSICS

The traditional metaphysics which reigned throughout the Western world between 1815 and 1830 did not give way all of a sudden to one or even a few different theories. Instead, thinkers chipped away at a number of exposed places on the edifice of the traditional theory. If those who invoked a new sense—whether muscular-based or innervation-based—were right, then many of the traditional claims about the possibility of proving the validity of our knowledge of the external world could be shown to be wrong, based as they were on an inadequate inventory of our sensory experience. Similarly, many of the traditionalists’ critiques of associationism could be shown to miss the mark, if associations could include associations to sensations of muscular effort. These various assaults on traditional metaphysics challenged its epistemological and/or psychological assumptions.

Alternatively, some thinkers challenged the traditional views on ontological grounds. This was decidedly riskier, because the challenger could always be accused of materialism or atheism. As a matter of fact, several of these challengers were so attacked, and many of them were also criticized for being ‘Spinozists’ (a term that still connoted

materialist atheism to the orthodox, and usually warranted the attentions of the secret police). Nevertheless, it was clear to many that the traditional view was highly susceptible at just this point: once one has assembled sufficient facts to map out laws relating psychological and bodily states, it would seem appropriate to suggest hypotheses relating these two realms of phenomena, despite the ban on such suggestions from the orthodox.

To illustrate some of the more important ontological critiques of traditional metaphysics, I have chosen three of the more important early challengers. The first, Schopenhauer, is typically classified as a philosopher; the second, Johannes Müller, as a physiologist; and the third, Fechner, as a psychologist. Each of these thinkers, in his own way, challenged the traditional metaphysical consensus, and offered an alternative ontology in its place.

Arthur Schopenhauer (1788–1860) was the heir of a well-to-do merchant family of Danzig (Gdansk), and the son of a well known woman novelist with whom he was unable to get along. All his life he was an ardent Anglophile (he read the London *Times* daily) and was almost certainly better informed about English-language philosophical trends than any of his German contemporaries. Although aware of some of the British attempts to rectify Kant's epistemology 'by dint of muscle', Schopenhauer chose to improve upon Kant (perhaps the only modern philosopher for whom Schopenhauer showed real respect) in a completely different way.

Unlike Kant, Schopenhauer resolutely refused to supernaturalize noumena. He treated our consciousness of self as direct access to the real, noumenal self. What writers like Erasmus Darwin and Brown vaguely referred to as a sense of effort Schopenhauer saw not as a form of sensory experience but as a direct knowledge of our noumenal being. Although direct and personal, this knowledge is limited primarily to the fact that the noumenon exists. This self or noumenal existence Schopenhauer labelled 'will', although he acknowledged that it bears only a metaphorical resemblance to the phenomenal will as experienced in our activity. Indeed, in his major work, *The World as Will and Representation* (1819 and later editions) Schopenhauer was quite explicit that one cannot even be certain whether your will and mine are two things or one, or whether there is any more than one 'will' in the entire universe.

Although our direct experience of the will is limited, our experience of the phenomenal world which reflects will is not, and offers Schopenhauer many insights into the distribution and nature of will. In his *The Will in Nature* (1836) Schopenhauer noted that evidences of will can be seen in both the anatomy and the behaviour of plants and animals. He considered the emphasis of Linnaean botany on the sexual organs of flowers to be consistent with the idea that the noumenal will of beings like plants can manifest itself in specifically different anatomies. And Schopenhauer considered many forms of behaviour, especially aggressive and sexual behaviour, as phenomenal representations of a noumenal will. Instead of being attacked for his heterodox ideas, Schopenhauer was simply ignored for most of his life, despite the great vigour and clarity with which he wrote. It was only in 1852 that Fortlage devoted some space to Schopenhauer in his history of German philosophy, which led to a discussion of Schopenhauer in *The Westminster Review* of 1853. (At that time this periodical was edited by Marian Evans, not yet 'George Eliot', but already a close friend of both Spencer and Lewes.) From all

accounts, this British publication of 1853 put Schopenhauer on the intellectual map, and his uniquely pessimistic ontology became as important in the 1850s and 1860s as Hegel's objective idealism had been in the preceding two decades.

Despite the suddenness and intensity of the new-found interest in Schopenhauer, his was a philosophy to be condemned by all but a very few. Not even the thoughtful reviewer of the *Westminster* could resist attacking Schopenhauer's beliefs. The same reviewer who understood and was willing to state that '[a]ccording to the consistent Kantis[t], physical theology, with its high priests Durham and Paley, is but an amiable absurdity, based on an illegitimate extension of the law of cause and effect to an object which lies beyond its jurisdiction'—was by no means willing to consider Schopenhauer's main ideas with equanimity. The review ends with a strong caveat: 'those who construe any of our remarks into an acceptance of such a system of ultrapessimism have totally misapprehended our meaning'. Schopenhauer is labelled 'genial, eccentric, audacious, and, let us add, terrible' and 'We only wish we could see among the philosophers of modern Germany a writer of equal power, comprehensiveness, ingenuity, and erudition, ranged on a side more in harmony with our own feelings and conviction than that adopted by this misanthropic sage of Frankfort'. Many writers were to attempt to fit this request, most especially those associated with the rise of modern psychology, such as Helmholtz and Wundt.

Not all critics of traditional metaphysics were as outspoken as Schopenhauer. One of the most effective and influential critics of early nineteenth-century thought, Johannes Müller (1801–58) has long been seen as a conservative. This view of Müller is an inheritance from his students' time. Müller perhaps has had the oddest misfortune of any scientist: to be so eclipsed by his students (among them Helmholtz and Du Bois Reymond) that his views are rarely evaluated on their own.

Müller's physiology was a unique combination of the best of German *Naturphilosophie* with Müller's own interpretation of Spinoza. Although he explicitly renounced Spinoza's metaphysics, it is unclear whether he genuinely meant to distance himself from Spinoza or from the troubles associated with being a Spinozist. In any event, much of Müller's philosophy in his tremendously influential *Handbuch der Physiologie des Menschen (Elements of Human Physiology)* (1834–40) reflects a careful assimilation of specific doctrines of Spinoza's *Ethics* into nineteenth-century life science.

For psychology, Müller's most important contribution was his doctrine of specific nerve energies: that each sensory nerve produces its own unique sensory (subjective) quality. Müller considered this doctrine an updating of Spinoza's notion that our perceptual ideas are, literally, mental reflections of states of our bodies. It is only because our nerves are material, and set into motion by other material causes, that the specific ideas we get from them can constitute experience of the world:

> The immediate objects of the perception of our senses are merely particular states induced in the nerves and felt as sensations… but inasmuch as the nerves…are material bodies…they make known to the sensorium, by virtue of changes produced in them by external causes, not merely their own condition, but also properties and changes of condition of external bodies. The information thus obtained by the senses concerning external nature, varies in each sense,

having a relation to the qualities or energies of the nerve.

Müller, like Shelley (whom he never read) and Spinoza (whom both read), believed that every natural occurrence exists as an effect of a series of causes, and that one can 'work backwards' from effect to cause, given enough knowledge. Our nervous systems, Müller claimed, are built with such knowledge that when they feel their own states they also learn something of the external world. The former (internally oriented) aspect of feeling is sensation (in Reid's sense) and embodies Müller's specific energies hypothesis; the latter (externally oriented) aspect of feeling is perception, which Müller saw as based on the former.

Unlike Reid and Kant, Müller argued that it is possible to explain how perception emerges from sensation. Once we know what kinds of changes occur in each sensory nerve we can offer hypotheses as to how these changes can be interpreted as the effects of specific causes, and thus how knowledge of the changes constitutes knowledge of the causes. This is strikingly like the theory found in Schopenhauer's *Four-fold Root* (1817) and Descartes' *Optics* (1637) for that matter, although it is unclear whether Müller was directly influenced by those works. Where Müller differed from both Schopenhauer and Descartes was in his insistence that the nervous system—and all animate matter—embodied a non-physical force, a vital principle. This vital principle, Müller believed, acted differently from ordinary physical matter, and could in fact cause ordinary physical matter to behave in ways inexplicable by the laws of physics or chemistry.

It is instructive to note that traditional metaphysics would have had a considerable basis on which to criticize Müller. Take, for example, his well known account of voluntary action: 'The primitive fibres of all the voluntary nerves being at their central extremity spread out in the brain to receive the influence of the will, we may compare them, as they lay side by side in the organ of the mind, to the keys of a pianoforte on which our thoughts play or strike'. Both Kant and Reid would have blanched at the calm with which Müller proposed to spatialize the mind, and to locate it within a particular region of space as well.

With Johannes Müller we have a scientist whose particular conceptual innovations—the specific nerve energies hypothesis and the motor keyboard—dominated later thinking long after his ontological views were in disrepute. This can be contrasted with Schopenhauer, whose own knowledge of botany and zoology is now obviously woefully out of date but whose metaphysical views keep resurfacing around different areas of modern science. Gustav Fechner (1801–87) offers a third prospect: someone whose main work is almost totally unknown, and who is nowadays revered for an innovation he himself considered a rather minor incident in a busy career.

Fechner, like Müller, offered a kind of Spinozist metaphysics. But, whereas Müller emphasized Spinoza's quasi-pantheism, Fechner emphasized Spinoza's views on substance, in particular his 'dual aspect' theory of mind and body. Fechner combined this dual aspect metaphysics with a kind of generalized atomism, in which he claimed to be able to show in particular how both electricity and mental force were constituted atomically. Fechner argued that the modern physical world view showed only one side of the universe, the mechanistic side, the interplay of the atoms according to laws of physical mechanism. But another side of the universe existed, the subjective, living side,

the mental atoms. Fechner went so far as to speak of a 'day view' (which acknowledged life and mind) and a 'night view' (which did not).

Fechner had come to his atomistic views as a professor of physics in Leipzig. The atomism and invocation of hypothetical forces found throughout the works of such figures as Müller, Fechner and Lotze was very much of a piece with contemporary trends in the physical sciences. When the new generation of physical theorists emerged—with Helmholtz, Hertz and Du Bois Reymond at their head, much of what counted as 'scientific positivism' was aimed at eliminating these hypothetical atomistic and dynamic concepts, in psychology as well as in physics. Wundt and other early self-styled experimental psychologists did not abandon Fechner's dual aspect theory—on the contrary, they built upon it. However, the first generation of self-styled experimental psychologists wanted nothing to do with the *ontological* theories of their predecessors. The dynamical and atomistic theories of Hartley, Erasmus Darwin, Herbart, Fechner and Lotze were strongly opposed. Thus, two opposite trends began to emerge: psychological theorists began increasingly to postulate unconscious processes (see pp. 328–35 below) and yet these same theorists claimed to want a psychological science that clung close to phenomena, and criticized earlier psychologists for their unfounded ontological assertions.

In Fechner's case, his psychology was intimately tied to his ontological theorizing. Fechner's protracted experimentation on subjective after-images in vision damaged his eyes in 1839 and led to what appears to have been an hysterical illness, including some sort of psychosomatic blindness, which forced him to resign his position. In 1843 Fechner regained his ability to see while walking in his garden, and claimed to have seen the souls of the plants there, according to his book of that title (1848). Three years later he published his account of the differences between the day-view and night-view, and also his theory of life after death in his *Zend-Avesta,* the appendix to which inaugurated psychophysics as a sub-discipline of psychology.

Basing his speculation on Helmholtz's recent account of the conservation of forces, Fechner argued that both physical and mental forces must be conserved in the universe. In particular, if physical force was to be conserved, then there would have to be a lawful relation between psychological and physical states. This study of the quantitative relationship between stimulus energy and sensations Fechner derived by generalizing Weber's work and called 'outer psychophysics'. Of more interest to Fechner was 'inner psychophysics', which would be the study of the relation between mental events (sensation) and their neurophysiological correlates—but Fechner's claims to be able to analyse these relations were almost universally dismissed as mere speculation, in contrast to his psychophysical techniques which were both emulated and modified.

Fechner argued that physical laws were of linear form, whereas the psychophysical laws were not, but few nineteenth-century thinkers were wiling to accept non-linear relationships as 'simple' enough to be lawful. The difference between the souls of animals and plants is that the former have brain structures that allow more complex psychophysical interrelations. And not only are plants ensouled according to Fechner, but so is the earth—a sort of nineteenth-century 'Gaia' hypothesis. The earth responds to physical stimuli with the most intricate vibrations and adjustments conceivable, Fechner noted, although it lacks a brain and hence lacks some of the more complex

psychophysical relationships. However, we who live upon the earth are part of it, and we contribute to its life and mind as if we were its sense organs, at least as long as we live. Moreover, when we die, our perceptions and memories do not die with us but find some echo in the myriad subtle adjustments of the earth to physical stimuli, and so there is a form of life after death. It is 'inner psychophysics' which explains these relationships among physical states (neural or earthly) and mental states—and it is Fechner's inner psychophysics which had no life after his death.

R.H.Lotze: last of the traditional metaphysicians?

Traditional metaphysics died out for two reasons. Firstly, it was institutionally ill-adapted for the increasingly professionalized and specialized academia that emerged all around Europe at first slowly after 1848, and then more rapidly after 1871. Secondly, as professionalization increased so did secularization, and appeals to either authority or intuition, which both tacitly and explicitly had guided the work of Cousin, Stewart and others, could no longer succeed. Ultimately, agnosticism replaced transcendentalism among professional elites, and traditional metaphysics was replaced by what was typically called scientific positivism. This scientific positivism in its purest forms always maintained that the true nature of either matter, the soul or the deity were unknowable. In this regard scientific positivism should be distinguished from Comtean positivism, and even from Spencerian positivism, as both of those thinkers imagined that they had more knowledge of the transcendental—of what Spencer chose inconsistently to call 'the unknowable'—than was allowed by the agnostics.

The success of scientific positivism in the latter part of the nineteenth century may be attributed to its allowing for extended scientific activity without provoking any direct conflict with religious doctrine. Thus it was an ideology well suited to developments in a Europe increasingly reliant upon scientific advances. However, scientific positivism was far better suited to maintaining rapprochement between physical science and religious orthodoxy than between biological or, especially, psychological science and mainstream religious beliefs. It is one thing for a Mach or a Hertz to deny that physics can understand what matter or forces are, beyond describing the laws of their phenomena; it is quite another for psychologists to limit their science to mapping mental phenomena, and to proscribe the search for how the brain is the mind.

The parallel with Darwin is here very striking. The scientific positivists (including Darwin's 'bulldog' Huxley) argued that Darwinian results spoke neither for nor against belief in God. They took this to be just another instance of their agnosticism. How can one know, they argued, that the causes and effects lumped into the term 'natural selection' do not have, as some sort of hidden or transcendent cause, a deity? Darwin repeatedly resisted this sort of argument, and for good reason. One of the key rationales for his theory was a critique of teleological biology, of the argument from design. In numerous ways Darwin showed that the hypothesis of design might be treated as a scientific hypothesis, and that many facts undermined it as a scientific hypothesis; facts that were better explained by Darwin's theory of natural selection. Perhaps the best known instance of this sort of discussion in Darwin is the conclusion to his *Variation of Animals and Plants Under Domestication*. Here Darwin was confronting the well

developed design arguments of the noted botanist (and good friend of Darwin) Asa Gray. Gray proposed that even though evolution proceeded by natural selection, divine design might play a role through the biasing or channelling of genetic variation. Instead of chance, a deity might guide variation in certain directions, so as to pre-adapt animals and species to the rigours of new environments. Neither Darwin nor Gray argued that such an hypothesis was unacceptable because it touched on the actions of the unknowable deity. On the contrary, they examined the implications of this 'guided variation' hypothesis, and Darwin was able to show that none of the predictions which followed from this hypothesis were borne out.

Like Darwin, many psychologists of this era were inclined to try and specify how brain states caused mental states, or the reverse. For example, Johannes Müller unabashedly suggested that the soul plays on the motor cortex as if it were a piano keyboard. But does it? Darwin was able to show that God does not design animals as people design clocks. Could a psychologist show that the soul does not move the body the way people move objects? An attempt at doing just this was made by R.H.Lotze (1817–81), one of Müller's most cogent critics. Although Lotze criticizes Müller, he cannot bring himself completely to abandon teleological thinking in psychology, or even a deity acting in the world. In many ways Lotze is a transitional figure, illustrating a way out of traditional metaphysics that was never to be completed.

Lotze is transitional in a second sense. He was not a specialist, although he did become a professional academic. Trained originally in medicine, he studied with both founders of psychophysics, Weber and Fechner, at Leipzig (where they taught physics). Indeed, while he was teaching medicine and philosophy at Leipzig in the early 1840s he also acted as Fechner's physician. In 1844 Lotze was called to take Herbart's chair of philosophy at Göttingen, and in 1881 he was called to the prestigious Philosophy Chair in Berlin, but died soon thereafter. He made his name in the 1840s with physiological works attacking Müllerian vitalism, but then proceeded in the 1850s to attack the emerging materialism from a position strikingly at variance with that of the ultimately more succesful dual aspect theorists.

Lotze's attack on vitalism was very straightforward. The idea of special powers or forces could be used to prevent inquiry and to encourage sloppy thinking. Lotze here relied on Weber and Fechner's concept of a science (based on physics): science as the establishment of quantitative laws relating phenomena. There is no 'life force' but there are special and interesting phenomena of life, which must be analyzed and reduced to lawful arrangements.

Up to this point Lotze's arguments were not particularly unique, although he was among the earliest to make them against Müller and what he saw as Schellingian or Romantic biology. Where Lotze's own views set him apart is in the next stage of his thinking, summarized in his *Medizinische Psychologie (Medical Psychology)* of 1852. Lotze now argued that the mind/body problem was resolvable through his view of science. Both mind and matter could be treated as phenomena emanating from a single set of forces (not substances). Lotze pointed out that it is changes in forces acting upon us that make us believe in matter (resistance) and, he claimed, it is changes in a certain kind of force that make us believe in mental states as well. Later, in his *Metaphysic*, Lotze went so far as to claim that

> We might…speak of the soul as a definite mass at every moment when it produces an effect measurable by the movement of a corporeal mass. And in doing so we should be taking none of its immateriality from it; for with bodies also it is not the case that they are first masses and then…produce effects; but according to the degree of their effects they are called masses of a certain magnitude.
>
> (Book III, chapter 5)

While Lotze's theory of the soul as possessing equivocal mass did not catch on, one of the implications he drew from this theory did indeed catch on and continues to influence psychological theorizing. This was Lotze's theory of 'local signs.' From his theory of the soul, Lotze argued that the soul cannot be influenced by the spatial layout of the nervous system but only by its intensity of activity at any given point. Following Müller's early localizationism, Lotze argued that cerebral activity in different locations did, as Müller suggested, produce different mental states (for example, activity in one region of cortex generates visual sensations, in another region auditory sensations). But all the soul could know of this activity was its intensity, the locus of that intensity, and changes in intensity at that locus. The soul could not directly intuit layouts of varied intensity in the nervous system. Knowledge of the locus of activity was the 'local sign' of a mental state, which would co-exist with knowledge of the intensity of that state, and all changes in intensity of that state. Associationists like Steinbuch in Germany and Brown or James Mill in Scotland had made somewhat similar arguments, claiming that the soul's activation of muscles would provide it with information about bodily loci that would be correlated with sensory input, but Lotze's theory was not associationistic (except in the sense that it invoked an innate association) and focuses on central activity, not a response-produces-sensory-activity cycle. Lotze also emphasized that the mental processes involved here are unconscious, thus blocking introspective analyses of these ideas, and promoting his kind of speculative physiology.

Lotze's 'local signs' theory in various forms (some much more associationist and empiricist than his) has exerted considerable influence in sensory physiology ever since its enunciation. Interestingly, Lotze's other critique of Müller, also based on his theory of the soul, has been rather influential but much less well acknowledged. In his *magnum opus, Microcosmos,* Lotze took on the ideological view of the soul, although he did not completely eliminate it. He argued:

> We deceive ourselves, when with a favourite simile we compare the body to a ship—the soul to its steersman. For the latter knows, or at least may know, the construction of that which he directs… Far from possessing this comparatively perfect insight into the working of the machine, the soul, on the contrary, is like a subordinate workman, who knows indeed how to turn one end of a winch… but understands nothing whatever of the internal transference of movements by means of which a completed product is turned out.

Explicitly attacking Müller's analogy of the motor cortex to piano keyboard, Lotze added

that the soul simply would not know what the notes were, nor where they were. The soul 'is ignorant of the relative situation of these notes, it knows not that this and not another note corresponds to the particular movement which it intends to make'. Astonishingly, this important argument remained essentially unheard for nearly a century, although it has recently been taken up in discussions of motor control.

Lotze followed this argument up by asking what sort of information the soul might have about movement, and in doing so he anticipated James's theory that the willing of movements derives from memories of movements. 'We bend our arm, not by giving a particular impetus to each of its several nerves, but by renewing in ourselves the image of the feeling which we experienced in a similar position'. Thus for Lotze the soul can act within itself, calling up a memory, or noticing a local sign, but it cannot act on the body. Instead, the soul's internal actions simply cause correlated bodily movements. There is an appeal here to something halfway between Leibniz's pre-established harmony and James's doctrine of ideo-motor action. Somehow the soul's own actions lead to appropriate bodily actions, and the way this happens is that an idea of action causes the bodily effects. The soul 'does not itself carry out the operation, but in a manner unknown to it the vital mechanism executes it commands'. Thanks to the doctrine of local signs the soul can also learn about the body's pattern of responses to stimuli: even when the body is acting on its own, the soul can keep apprised of changes of activity at different loci and register the feelings involved in particular actions.

Lotze thus stands as the source of two very different developments in psychological science. On the one hand, students of motor and sensory physiology began at this time their quest for locating pathways and correlations of local activity, without concern for the question as to what the soul was willing or perceiving in those activities. Studies of how localized stimulation of cortex generate specific movement patterns are good examples of trying to examine how the 'vital mechanism' translates mental cause into bodily effect. The *assumption* that the central activity is tantamount to a 'command' of the soul was, following Lotze, still made, even though there could now be no question of mental content in that command. What would be the mental content of an efferent pattern exciting contraction in a muscle unknown to the mover? On the other hand, students of ideo-motor behavior could analyse patterns of mental activity, asking questions about cause and effect among ideas (for example, what causes an *idée fixe* and/ or its accompanying obsessive behaviour?) without concern for the neurophysiological substrate of this activity. Lotze's influence among practising psychologists and neurophysiologists, although not acknowledged, seems to have been considerable.

THE THREE UNCONSCIOUSNESSES AND HOW THEY GREW

From the study of mind to the analysis of the unconscious

The idea of unconscious mental processes, or even of *the* unconscious as some sort of an entity, was by no means original with Freud. On the contrary, many thinkers at the turn of the nineteenth century were pondering the nature of the unconscious. However, the unconscious of the 'romantics'—especially that of Schelling and *Naturphilosophie*,

which so influenced German literature—was as much ontological as psychological. In a theory so inchoate as to defy easy description, many of these Romanticists equated the physical forces (fluids?) of electricity and magnetism with irrational urges and vague feelings, some of oneness with nature, others of a far less ethereal longing for oneness. Despite his loathing for Schelling and Fichte, it is clear that Schopenhauer's very carnal will emerged as a coherent ontological response to the irrationalism these writers were parading as a successor philosophy to the Kantian critique. (Probably Maine de Biran's metaphysics has a similar background.)

With philosophers, speculative physicists, Brunonian doctors, mesmerists and animal magnetizers claiming to have an analysis of the unconscious and its role in human life, is it any wonder that the Church-vetted professors of philosophy blanched at the idea of a scientific psychology? Traditional metaphysics's repeated emphasis on introspection as the sole safe method of proceeding in the philosophy of mind or moral philosophy was an attempt to create a boundary between what they saw as sober science and unsafe speculation. The use of physiological methodologies—which we now see as a harbinger of a true, progressive psychology—was equated with these worrisomely unsafe ideas about the irrational nature of the human soul.

Mainstream psychological theory 1815–30 was thus committed to the existence of an individual soul, from which all mental phenomena were to be derived. Evidence of the existence and nature of mental and moral phenomena was to be based on introspection. Nevertheless, even introspection raised some difficult questions about how wisely and well God had made our souls. The phenomena of sleep and drunkenness showed obvious ways in which the mind could be made to wander down dark pathways. And the claims of the mesmerists to produce a kind of 'magnetic sleep' were also worrisome: could physical agencies produce trance-like states? And, if *physical* agencies were uninvolved in mesmerism, then did that mean that some *psychological* force—ultimately to be called 'suggestion'—was operative?

At least three separate strands emerged at this time for the understanding of what we would now call unconscious mental states. In the first line of thought, the unconscious continued to be treated ontologically, and was associated with Kant's noumena. I call this the *supernatural unconscious.* On this theory, actions that people make without consciousness, or against their conscious ideas, are treated as being caused by forces that cannot be observed (are not phenomenal but noumenal). Others refused to treat the unconscious as qualitatively different from other natural mental phenomena. (Although some were willing to invent hypothetical natural forces as explanations, such as the Odilic force theory of the 1840s.)

There were two kinds of theories of what I shall call the *natural unconscious*. The first form of the natural unconscious theory focused on the concept of unconscious ideas or mental states: inferring from introspection that a particular mental state 'had to' have occurred even though introspection did not reveal the idea. The second form of this natural unconscious theory postulated the existence of a whole unconscious mind, separated off from the conscious one. The contrast is important. Herbart, for example, hypothesized unconscious ideas and to a large degree invented the modern concept of a threshold to explain when ideas 'came into consciousness'. But Herbart emphasized ideas only, he did not speculate on the existence of an entire unconscious mind, or part of the

mind.

The third kind of theory of the unconscious was the most radically different from its predecessors. Whereas something like the notion of unconscious ideas can be found in Leibniz, and whereas Stahlians and others (like Whytt) had been willing to postulate parts of the soul not easily accessible to rational consciousness, all these prior theories of the unconscious had treated it as in opposition to the conscious soul. In particular, these theorists tended to treat the conscious soul as the rational soul of Christian dogmatics, and the unconscious as irrational, and certainly as incapable of rational thought. Indeed, where theorists had been inclined to see rational activity of an unconscious sort, they had unanimously attributed it to *God's mind*, not to the individuals. For example, Whytt had argued that the 'sensitive soul' in the spinal cord was capable of feeling noxious stimuli and acting in whatever way would remove the potential danger to the organism (he had in mind the capacity of a spinal frog to wipe away an acid-soaked tissue placed on its skin). But Whytt emphasized the great difference between this and the rational soul we know through consciousness, which can feel and think many different things. All Whytt's sensitive soul can do is whatever God has arranged for it to do to preserve our bodies and maintain a harmony among the parts of our organism. Prior to Whytt, Malebranche had argued that such phenomena are in fact instances of *God's* thinking, not of our thinking. What Whytt had seen as a God-given ability of the spinal cord to relate stimuli lawfully to responses via a kind of unconscious feeling Malebranche saw as an instance of God's feeling and acting to enable us to preserve our bodies.

As of 1830, the unconscious was considered to be either a supernatural or a natural source of irrational forces; if and when rational but non-conscious acts occurred, they were attributed not to the individual but to his or her maker. John Stuart Mill changed all this by hypothesizing a rational unconscious mind. He had to make such an unusual hypothesis in order to save the associationist psychology which his father had championed, and which he hoped to make the basis of all social thought.

A logical unconscious

The nineteenth century thus saw the rise of what appears to be a radically novel concept of the unconscious, which I shall call the *logical unconscious.* In this conception, there are non-conscious mental processes which are identical with, or at least resemble, the process of drawing inferences and making judgements. The logical unconscious emerged in the writings of John Stuart Mill as he engaged simultaneously in defending and improving his father's associationism and developing a general logical theory consistent with this new improved psychology. Although historians have tended to locate the doctrine of 'unconscious inference' in the 1850s and 1860s in Germany (especially in the work of Helmholtz and his erstwhile assistant Wundt), Mill's *Logic* is probably the source of this doctrine, and we know that it was read and used by these and other prominent German psychologists. (It is also possible that Mill's defences of associationism against Bailey, published in 1842–3 and reprinted in 1859, were utilized by these German thinkers.)

The proponents of the logical unconscious often appealed to earlier ideas, especially Leibniz's notion of *petites perceptions,* as inspiring their thinking. But the resemblance is

superficial, as it does not take into account the difference between the already accepted notion of an irrational unconscious and this newer unusual idea of a rational unconscious. These differences will be clarified after I outline Mill's important innovation and its influence.

In working on what was to become his *System of Logic*, John Stuart Mill faced a set of problems that had yet to be addressed within the kind of associationistic psychology championed by James Mill. In particular, the epistemological context of the younger Mill's work made it imperative for him to identify the sources of our knowledge of truths. One of the passages in the *Logic* known to have been written near the outset of John Stuart Mill's work, and which remained essentially unchanged through eight editions, is the following comment from section 4 of the Introduction: 'Truths are known to us in two ways: some are known directly, and of themselves; some through the medium of other truths. The former are the subject of Intuition or Consciousness; the latter, of Inference.' By focusing on the nature of how truths are known, Mill changed the status of sensations in associationistic epistemology. For Hartley, Condillac, James Mill and others, what we call sensations formed the basis of all knowledge, including knowledge of truths, but no sharp line was drawn between sensations as a truth of consciousness and other truths, called inferences by the younger Mill.

The consequences of Mill's distinction here are of profound importance for psychology. If Mill's distinction is taken as a basis for theorizing, then the first step in any account of a psychological process is to discover what are the intuitions available to subjects. Once a complete list of these intuitions is made, then any other putative knowledge must be inferential—either false or true inference. There are foreshadowings of Mill's distinction in Berkeley's concept of minimum sensibles, and in Hume's basic impressions—but neither in these nor in other cases was the issue one of truth or inference, as Mill made it to be. Logic, for Mill, is the study of the inferences we make from truths already known (as he says at the end of this section of the introduction). This is the source of Mill's psychologism, his belief that logic cannot be distinguished as a special science without the results of a special branch of psychology: the psychology of sensations.

John Stuart Mill's careful attempt to distinguish between sensations and inferences comes in response to the Scottish common-sense psychologists and their emphasis on intuition, or what many of them preferred to call 'consciousness' (a term which the younger Mill used, perhaps grudgingly, in a similar way). But there is an important inversion here: in Thomas Reid's epistemology the truths of intuition are not identical with sensations. On the contrary, Reid invented the modern distinction between sensation and perception largely so that he might attribute truth to *perceptions*. Put simply, Reid was less interested in whether or not my sensation of the colour red is true than in whether my perception of this rose as an existing object (which happens to be red) is true. Reid argued that what are true in consciousness are things like my perception of the rose as well as any sensations of colour or scent I might have. This distinction between two aspects of consciousness—sensation and perception—was considerably muddled by the 1830s, when Mill was working on his *Logic*. As was shown above, Thomas Brown essentially subverted Reid's distinction, resulting in a theory that relied entirely on sensations and associations. William Hamilton, the last great proponent of 'Scottish

philosophy' also never understood Reid on this point, and obfuscated the matter greatly with a number of secondary and subsidiary definitions about sub-species of sensation and perception (see his *Notes* to his edition of Reid). Stuart Mill's confusion concerning what should count as a truth of consciousness is thus understandable, as he may have been attempting to contrast Hamilton's (or Thomas Brown's) thinking with the associationist views of James Mill.

In this context, the younger Mill's attack on Samuel Bailey's critique of Berkeley is very significant. Mill wrote his essays on Bailey just as the *Logic* was being completed (1842–3), and he clearly welcomed the opportunity to rethink these basic issues about consciousness and inference. Yet Bailey, unlike other nineteenth-century 'common-sense' philosophers, *did* understand Reid's distinction between sensation and perception (although Bailey used different terminology from Reid's). Therefore it ought to be interesting to see how Mill replied to a Reidian attack on some of Mill's fundamental assumptions. Bailey, like Reid, argued that 'the perception of outness is a component part of the sensation' (of vision or touch) (p. 31); Bailey also argued that 'we cannot explain…why…these tactual and muscular sensations are not felt without a perception of different distances' just as Reid argued that we could never explain why perceptions (beliefs in objects) accompanied sensations.

Starting from this Reidian basis, Bailey proceeded to demolish Berkeley's theory of vision, as interpreted by associationists like Condillac and James Mill. In that theory, visual sensations are supposed to become associated with tactile sensations in such a way that the perception of distance is achieved, or appears to the subject to be achieved, by means of sight. Bailey's argument is straightforward: firstly, if one assumes that no sensations (visual, tactile or other) contain information about outness, then outness can never be the result of the association of these sensations. In particular, Bailey pointed out that when we touch objects at different distances we have a variety of tactile sensations as well as perceptions of outness; yet, when we see things at different distances, no matter how hard we try, none of these tactile sensations comes to consciousness. Secondly, if one assumes, as Berkeley did, that touch contains information about depth and outness, and that touch 'teaches' vision, what is to stop Bailey from arguing that vision itself contains information about outness (as James later did)? Once again, when we look around we do not become conscious of tactile sensations suggesting outness or associating with visual ones, we simply see outness, a psychological fact, encompassing both visual sensation and perception.

Mill's critique of Bailey started with an attack on the sensation-perception distinction. Following Brown and James Mill, Stuart Mill argued that 'The sense of sight informs us of nothing originally, except light and colours, and a certain arrangement of light and colours'. Mill needed to start here, because these lights and colours (visual sensations) are the intuitive truths on which all knowledge, for Mill, was based. Yet Bailey had already anticipated this line of attack, noting that there was no empirical evidence for this claim about what we 'originally see' (or what might better be called our visual sensations). As Bailey put it, 'it is certainly true that we see by means of rays directed endwise to the eye, but it is equally true that we do not see the rays themselves either endwise or sideway: we simply see the object'. The evidence for Mill's claim about basic intuitive truths in sight comes from his analysis of the physiological optics of the eye, not

from the evidence of consciousness nor from empirical evidence about what people see—at best, only geometers and opticians see rays of light.

Once one accepts Mill's starting place, then the rest of his argument follows: that there are 'two powers' of vision, original (intuitive) and acquired (inferential). From here it is a short step to Mill's theory of perception, with its striking echo of his *Logic* in Stuart Mill's edition of James Mill's *Analysis and Sensations:*

> [T]he information obtained through the eye consists of two things—sensations, and inferences from those sensations: that the sensations are merely colours variously arranged, and changes of colour; that all else is inference, the work of the intellect, not of the eye; or if, in compliance with common usage, we ascribe it to the eye, we must say that the eye does it not by an original, but by an acquired power—a power which the eye exercises, through, and by means of, the reasoning or inferring faculty.

The familiarity of Mill's theory of perception should not be allowed to obscure the novelty and strangeness of his argument: the original powers of the eye, according to Mill, are such as cannot be known through consciousness, because we never do see only light, colours and their changes. Thus, the original powers of a perceptual system are supposed to do two contradictory things: firstly, they are supposed to provide one with the basic intuitive truths on which to build knowledge of the world; and, secondly, they are supposed to be inaccessible to intuition, because of their involvement with complex associations and inferences. For Bailey and other Reidians, the very definition of a sensation or an intuitive truth was something that could be known through intuition or consciousness. Mill had seemed to adopt this definition at the outset of his *Logic*. But, when pushed into justifying his theory of perception, Mill abandoned this basic tenet, suggesting instead that sensations can be known only through inference. Later, in his *Examination of William Hamilton's Philosophy*, Mill adopted Carpenter's term 'unconscious cerebration' and also made explicit his reliance on physiological 'facts' for specifying the basic sensations of vision and the other sensory modalities. (Peirce read this as a licence to cut free from introspective psychology altogether, and combined it with Bain's definition of belief as whatever we are prepared to act on—consciously or not—and invented pragmatism.)

It is amusing to see Mill criticizing Bailey for carelessness in distinguishing between 'what the eye tells us directly, and what it teaches by way of inference'. If Mill were right, then the eye could tell us nothing directly, because it is only through inference that we can know our basic visual intuitions. The rest of Mill's attack on Bailey consisted in trying to show that Bailey had begged the question by using a word like 'perception' when he should have said 'judgement' or 'inference'. But of course it was Mill who begged the question here, refusing to allow Bailey the very distinction on which he built his theory. Bailey repeatedly looked for evidence in consciousness—as Mill told him he should—of the visual and tactile sensations out of which Brown, and the Mills, claimed depth perception was built. Finding no such evidence, Bailey concluded that their theory was wrong.

Mill responded that the evidence of consciousness is irrelevant: after all, the original

intuitions of both touch and vision can be unavailable to consciousness, at least on Mill's definitions. This is where Bailey's second argument comes into play. Bailey repeatedly asked how the association of a tactile sensation with a visual sensation can yield information about outness if neither of the sensations contain such information. Mill actually agreed with this point, but hastened to add that the process involved is more like that of an inference or a judgement than that of mere association. Mill used his chemical analogy to good effect here, arguing that the 'association' of several chemicals often yields a distinctively new entity. In addition to unconscious intuitions, Mill was willing to postulate unconscious inferences.

Prior to the 1830s the idea of unconscious intuitions or sensations was a rarity, and the idea of an unconscious inference was unheard of. The interaction of Scottish philosophy with Millian associationism produced a greater precision of language in reference to sensations and perceptions, and introduced a whole series of concepts that soon became ubiquitous in nineteenth-century psychology: original powers of perception, as versus acquired; concept of basic sensations; the concept of unconscious sensory states; the concept of unconscious judgements. Reid's attack on the concept of the association of ideas led to a progressive clarity among associationists, up to and including the elder Mill, who clearly meant association of *sensations* to be the basic law of his system, even when his language slipped into older terminology. The younger Mill, in attempting to extend associationism into logic and epistemology, was careful to distinguish sensations from perceptions, and took the radical step of divorcing sensations from introspective psychology. Henceforth, sensations could be 'analysed' by inference from physiological data about what 'must be' the basic sensory qualities of a given system. Once this decompositional analysis was accomplished, then an analysis of the inferences needed to get knowledge of the world from this sensory basis could proceed.

Epistemology was cut free from introspection—because, after Mill, the elements of introspective awareness ('sensations') were to be analysed in the first place physiologically and, only after this, psychologically. What had begun as the younger Mill's attempt to defend and extend his father's introspective associationist psychology now placed 'the evidence of consciousness' a distant second in importance. The Frankenstein psychology with its explanation of all of the mind in terms of sensation-based associative processses feared by early nineteenth-century orthodoxy now took a central place in the middle of the century—but as an unconscious, not a conscious process. Mill believed in a psychologistic programme of building 'logic' (epistemology and theory of science) on the foundations of physiological psychology. This approach was to reach its high point in the work of Hermann von Helmholtz, who saw his work in physiological optics and acoustics as prolegomena to any future epistemologies.

INTERLUDE: 1848 AND ALL THAT

The remarkable increase of interest in scientific psychology in the 1850s and 1860s has been almost universally interpreted as the emergence of an experimentally oriented, scientifically grounded discipline of psychology out of what had been a more philosophical psychology. Turner expresses this consensus well when he writes that, in

German universities,

> [U]ntil the last half of the nineteenth century psychology did not exist as an independent discipline, but rather as a subfield of general philosophy. The philosophers who offered lectures in the field readily incorporated experimental physiological results that came to their attention, but they normally developed their psychological views and systems mainly through logical, metaphysical, introspective, or purely experiential considerations…. Beginning in the late 1850s…the older tradition of philosophical psychology began to give place to a new tradition that stressed experimental results and physiological considerations.

As with all myths, there is some element of truth here. In Germany, 'professors of philosophy' often worked extensively in psychology. Herbart, Fries and Lotze are three important examples. But the odd thing about these thinkers is that they do not really fit our twentieth-century conception of a philosopher. As a consequence, they figure far more prominently in histories of psychology than in histories of philosophy. We should not be fooled by the label 'philosophy' applied to these thinkers' professorial positions, because there is no reason to assume that that word meant in the 1830s and 1840s what it means now. Indeed, the Philosophy Chair at Göttingen was held successively by Herbart, Lotze and G.E.Müller. No one would even attempt to make the case that the last-named ranks as a philosopher in the modern sense of the term, and the case for the first two is not much better. Modern historians are nearly unanimous in agreeing that not a single major philosopher of this period was to be found teaching philosophy in an academic position with the conspicuous exception of Hegel. Nor should it be forgotten that many of the most important contributions to scientific psychology came from academics who held chairs in physics, like Fechner and the Webers, or in medicine and physiology, like Johannes Müller.

Although intellectuals based in academia had to conform to the ideological standards of Church and State or risk loss of their livelihoods, this was of course not true of independent intellectuals like medical doctors, industrialists, mechanics or parsons. Thus the pressure of arguments from heterodox psychologies became increasingly great until, with the significant social and political changes wrought by 1848, the whole structure of traditional metaphysics was exploded. It no longer became possible to write about the mind in complete ignorance of current physiology and experimentation; or, to be more precise, any pretensions to scientific status in discussions of the mind required acknowledgement of the 'Frankenstein' psychology which had heretofore largely been excluded from the polite company of academic discourse. The ritualistic denunciations of materialism and atheism that pepper the works of traditional metaphysicians (especially their textbooks) became replaced by argumentation. The unthinkable was being thought: metaphysicians were questioning what the role of embodiment might be in psychology. Far from being a marginal doctrine—one that stigmatized its professor as an atheist—Spinoza's dual aspect theory gradually began to win adherents from many different intellectual backgrounds until, by 1880, it had become the dominant position among scientists concerned with the nervous system and the mind.

Attacks upon materialism are common throughout psychological writings in the 1850s and 1860s, from the popular essays of Helmholtz to the positivistic quasi-idealism of the late John Stuart Mill. The flavour of many of these attacks is captured in some remarks in a lecture given by Oliver Wendell Holmes, Sr (the doctor) to the Harvard Phi Beta Kappa Graduates in 1870. The lecture began with a statement that simply could not have been uttered at Harvard a decade earlier: 'The flow of thought is, like breathing, essentially mechanical and necessary, but incidentally capable of being modified to a greater or lesser extent by conscious effort.' Such Shelleyan determinism and apparent materialism would have horrified earlier audiences at such an institution had they been allowed to be spoken. (And, in all probability, Holmes's comments did cause some stir.) But Holmes is no materialist and he repeatedly made clear in his lecture that medical science can and should be indifferent to the conflict between 'materialism' and 'spiritualism'. In other words, the scientific study of the phenomena of thought and action should be divorced from these metaphysical interpretative disagreements. Yet Holmes could not resist showing that he is on the side of the angels, and he ends his lecture making fun of the kind of 'vulgar materialism' promulgated by Büchner and others. Can a human person be reduced to what he or she eats and drinks? No, said the good doctor, 'It is not in this direction that materialism is to be feared: we do not find Hamlet and Faust, right and wrong, the valor of men and the purity of women, by testing for albumen, or examining fibres in microscopes'. After 1848, the bourgeoisie discovered that their morals need not be corrupted by advances in the sciences of human nature—so long as certain 'interpretations' of those sciences were kept at bay.

The 'psychology as a natural science' defended by James had its origins in this spirited demarcation of the transcendental from the natural. The scientists living in a post-1848 world insisted that traditional metaphysics had lost the battle: science had nothing to say about transcendental concerns. 'Systems' as such were now the enemy, because any and all philosophical systems smacked of ideology, and strong ideologies in any form (whether that of the backward-looking peasant or aristocrat or the progressive ideology of the new working class) could upset the status quo. The positivism that swept across Europe was by no means Comte's positivist system but was instead a general anti-systemic bias, which itself proved to be more biased against heterodox than against orthodox ideologies. The defeat of the high orthodoxy of traditional metaphysics was thus used primarily as a cudgel against the heterodox: if science could say nothing of the soul, then it certainly could not affirm the materiality of that transcendental creature. We should thus remain 'agnostic'—to use a term coined by T.H.Huxley to capture just this philosophical suspension of belief.

Kant and Reid had of course tried out their version of agnosticism almost a century earlier, and it proved to be a highly unstable position, as we have seen. Similarly the widely touted scientific agnosticism of the late 1800s also succumbed to its own internal contradictions. On the one hand, psychologists like Wundt could not be constrained from at least formulating hypotheses about the nature of mental activities and states. Wundt offered a form of voluntarism that was a sort of optimistic version of Schopenhauer's world as will. On the other hand, philosophers—and especially the emerging school of neo-Kantians—refused to allow scientists to debar transcendental arguments. The neo-Kantians specialized in turning the agnostic arguments of Helmholtz into a basis for anti-

materialist metaphysical theorizing, as the following passage from Lange's extremely influential *History of Materialism* attests:

> this matter, with everything that is formed from it, is only an abstraction from [our mental representations.] The struggle between Body and Mind is ended in favour of the latter…. For while it always remained an insurmountable difficulty for materialism to explain how conscious sensations could come about from material motion, yet it is, on the other hand, by no means difficult to conceive that our whole idea of matter and its movements is the result of an organization of purely intellectual dispositions to sensations. Accordingly, Helmholtz is entirely right when he resolves the activity of sense into a kind of inference.

THE DEVELOPMENT OF A POSITIVE PSYCHOLOGY

Institutional confusion: theoretical convergence

The evaluation of intellectual trends in the decade or two following 1848 is decidedly tricky. This period is one in which modern institutional and disciplinary boundaries began to emerge, so it is ridiculously easy to miss important patterns simply by not knowing where to look. Although academic positions become increasingly important during this period, it is conspicuous that many of the great scientists and philosophers of Europe at this time worked outside of academia. Prussia perhaps led the way into institutionalizing and dividing up intellectual work along more or less modern lines. But even in Prussia in the 1850s and 1860s it is not always easy to see where to look for philosophical and psychological activities. For example, the linguistics of Paul, Steinthal and others emerged as a fully-fledged discipline in these decades, with its own professorships and journals. But this ostensibly specialist discipline of linguistics was to later influence an important professor of philosophy, Wilhelm Wundt, who made historical and comparative studies of language and gesture the entry-way into his brand of empirical social psychology.

There are signs that an historical and comparative approach to psychology was broadly influential across Europe in these decades after the 'springtime of the peoples' and well before the self-consciously historicist arguments of Dilthey and others in the *fin-de-siècle* period. This historicism was less an emulation of Hegelian ideas—which were in ill repute at this time—than an emulation of *Comte's* method. It is not widely appreciated that Comte's attempt to account for all of intellectual activity through a kind of linear growth and reorganization model spawned numerous attempts to deploy such a model in other areas. Moreover, Comte's and positivism's suspicions of hypothetical entities such as forces and atoms was strongly reinforced by developments in physics, which seemed to be pointing away from the usefulness of positing such entities behind the phenomena.

Several powerful thinkers tried to amalgamate this positivistic interpretation of scientific laws as merely patterns in phenomena with an historical method for deriving the data of human behaviour. A number of the contributors to historical linguistics took

approaches along these lines. Even more relevant for the present account was the work of two thinkers who self-consciously tried to create a psychology out of historical materials and positivist hubris, Hyppolite Taine (1828–93) and Thomas Henry Buckle (1825–62).

Both Taine and Buckle argued explicitly that psychological laws could be derived only from historical materials, not from experimental methods. History was said to reveal patterns of behaviour across different situations which, when properly analysed, would yield true laws of human nature. In contrast, Taine and Buckle criticized laboratory-based or introspective-based psychology for its narrow foundation, and its inability to generalize its results. Taine's monumental *History of English Literature* (1861) tried to analyse the human mind using evidence from one nation's history and literary productions. In his remarkable preface to this work, Taine justifies this procedure as being one that is still capable of yielding generalizable results. Buckle's maddeningly rambling but often insightful *History of Civilization in England* (1857) is similarly nationalist in intended scope (but Buckle cannot resist a number of continental excursions). Both Taine and Buckle see human nature as a product of nature and culture, a product arrived at through a particular historical progression.

G.H.Lewes

Looking back over a career which involved four decades' study of philosophy and literature, Taine wrote, 'All I have been doing for the past forty years has been psychology, applied or pure.' But what *was* psychology in the 1850s and 1860s when Taine first made a name for himself? In those years no one anywhere in Europe could make a living teaching, studying or researching psychology. Yet serious psychology in these decades was being done by a greater assortment of people than ever before: philosophers and doctors but also physiologists, journalists, literary writers, spiritualists, phrenologists, mesmerists and more. The career of G.H.Lewes (1817–78) is doubly instructive concerning the institutional fluidity of psychology in the two decades following 1848. Firstly, Lewes was an important thinker whose considerable body of work repays careful study. More so than in Bain's much better known writings, Lewes strove to integrate contemporary trends in philosophy, psychology and physiology. He was especially important for showing how contemporary German physiological thought could be integrated with British evolutionism and associationism. Secondly, Lewes was a prolific and effective popularizer. His texts on physiology influenced both Sechenov and Pavlov, as well as countless British scientists. And in his often reprinted biography of Goethe and his equally popular history of philosophy Lewes gave several generations of English-speaking readers their first introduction to recent German and French schools of thought, including both Hegel's and Comte's ideas.

Despite the demonstrably pivotal position he played in mid-nineteenth-century philosophical psychology, Lewes is nowadays almost invisible in the history of philosophy, and a mere footnote to histories of psychology. Boring devotes only a passing mention to Lewes, seeing him as an evolutionary associationist of less influence than Spencer. More recent histories of psychology either echo Boring or remain silent. Spencer himself credited Lewes with arousing his interest in philosophy (and Spencer almost never acknowledged any form of intellectual indebtedness) so it may be useful to

pay more attention to his contribution.

One problem with estimating Lewes's importance is the institutional oddness of the intellectual world of 1840–70 when viewed from the confines of modern academe. Lewes was never anything like a professor or a teacher, nor even more than an amateur physiologist (albeit an amateur who had made it a point to do laboratory work with the likes of Liebig—which perhaps doesn't quite fit our idea of an 'amateur' either). Like Spencer, Lewes was primarily a journalist. He was not merely a contributor to the thriving intellectual journals of Victorian Britain but an editor and founder of several important periodicals, including *The Leader*, *The Westminster Review* and *The Fortnightly Review*. He was also an influential adviser at the birth of both *Nature* and *Mind*, two of the first 'academic' journals of importance in Britain.

Lewes's interests were always broad, and he made real contributions to drama, literature and biography (his biography of Goethe was the first complete one in any language) as well as in science and philosophy. Lewes's career offers an image of an altogether different kind of intellectual world from the one that has developed since the 1870s. This is why his work does not fit straightforwardly into any single disciplinary history. But this is just my point: historians of philosophy and psychology cannot assume that the boundaries of their discipline are or were clear, and they certainly should not impose a contemporary view of those boundaries on to the history of their disciplines.

Lewes was among the first nineteenth-century philosophers to discuss Spinoza and Hegel in Britain. Lewes's interest in Spinoza was kindled in the 1830s through conversations with Leigh Hunt (who had learned about Spinoza's ideas from Shelley twenty years earlier) and perhaps through reading Heine's work. Lewes's article on Spinoza in 1843 (printed in *The Westminster Review* and also as a pamphlet) proclaimed Spinoza to be a pantheist predecessor of Strauss and Feuerbach. Lewes especially emphasized the doctrine of Spinoza's that came to have great influence on psychology—the idea that spirit and body are merely two aspects of one thing, ourselves, and that the soul is our 'idea' of our bodily self.

But it was Lewes's visit to Paris in 1842, where he met both Cousin and Comte, that stimulated his most fruitful transmission of European ideas to Britain. Within a year Lewes was publishing enthusiastic accounts of positivism, and discussing plans with Bain and Mill to translate Comte's *Cours* (in the event these plans fell through, but Lewes was later influential in arranging Harriet Martineau's edition of Comte a decade later). It was at this time (1842–6) that Mill himself was most under Comte's influence, and considered that his own *Logic* represented something like a positivist philosophy of science. (A spectacular example of how badly our present disciplinary boundaries apply to the last century is the Mill-Comte correspondence of 1842–3, which is dominated by arguments over whether phrenology is a scientific approach to the study of mind.)

Lewes later revisited Comte in 1846, when Comte's great love, Clotilde de Vaux, was dying, and Lewes was probably the first British 'Comtean' to turn away from the man and his increasingly eccentric ideas, focusing instead on a doctrine, ultimately called 'positivism'.

Lewes's *Biographical History of Philosophy* appeared in 1845–6, including substantial discussions of German philosophy, especially that of Spinoza, Kant and Hegel, and ending with what can only be called a paean to Comte (later toned down and changed

into a positivist credo). This book was as popular as any philosophy text had ever been in Great Britain and the United States. Thus, despite being widely repeated in histories of the subject, the claims of the Oxford Hegelians that they brought German philosophy to Britain (after Coleridge's failed attempt) are simply false by more than a decade. It is also interesting to see that this popular text championed positivism a few years before 1850.

After 1848, Lewes was heavily involved for a time in political journalism (he founded *The Leader* with Leigh Hunt's son, Thornton) and in promoting the career of Marian Evans ('George Eliot'), his spouse. None the less, he also found time to write his first popular book on physiological psychology, followed by a series of increasingly technical works. His popular writings, especially *The Physiology of Common Life* (1859–60) promoted the kind of everyday materialist physiology found especially in Moleschott and Büchner but eschewed their anti-idealist metaphysics. Instead, Lewes's positivist views allowed him to remain rather agnostic concerning *how* sensations and feelings accompanied such everyday physiological acts as eating and focus on what Lewes saw to be facts: the correlations of feeling with physiological processes and bodily activity. This invention of a half-Spinozist, half-positivist physiology of mind was Lewes's master stroke. Before the century was out this position would come to dominate physiology and psychology all across Europe.

Lewes did not remain satisfied with this agnostic position, how-ever. In his multi-volume and partially posthumous *Problems of Life and Mind* (1874–9) Lewes broke with the positivists' anti-metaphysical stance to suggest what he called a 'metempirical' philosophy—a binding of philosophical inquiry to scientific findings. Variants of this position became the dominant credo among late Victorian scientists like Huxley, Tyndall and Clifford, all of whom were friends of Lewes's.

P*roblems of Life and Mind* is a self-consciously magisterial attempt to survey various lines of thought about psychology, and to offer a particular programme of research as a 'most promising' course to follow. The treatise is in three parts: a general philosophy of science as applied to psychology (*The Foundations of a Creed* in two volumes); a study of mind-brain from a dual aspect point of view, emphasizing the physiology of everyday life *(The Physical Basis of Mind);* and a sketch of a general psychology, describing its scope and limits (*The Study of Psychology* in two volumes). Lewes did not live to finish this last part, and George Eliot put the manuscript through the press—surely the only psychology text ever edited by a major novelist!

Despite its excessive length, there is also much that is not included in *Problems*. Lewes seems to have been unmoved by the rising tide of experimentalism among continental psychologists. He was familiar with Fechner and Wundt but saw them as marginal figures. Here Lewes's book was less prescient than that other great text of 1874, Brentano's *Empirical Psychology,* which acknowledged Wundt's importance, if only to take issue with his concept of inner observation. Lewes (like Lotze) was more of a physiological than an experimental psychologist. He was more at home in his extensive analysis of the reflex functions of the spinal cord than in worrying about Weber fractions, or the differences between introspection and inner observation.

Lewes's work on spinal function (much of it based on his own replications and extensions of experiments by Whytt, Müller, Hall, and others, all of them using amphibians vivisected in his own amateur laboratory) exemplified a crucial transition in

psychological thinking. For Lewes, spinal reflexes are part of psychology, and issues relating to sensation and even consciousness within the spinal column must be addressed. Lewes berated Huxley for misconstruing the psychological issues raised by studies on reflexes in the latter's important 'On the Hypothesis that Animals are Automata' (1872–4). Lewes regarded as very wrongheaded this attempt to treat the marvellous adaptive properties of the spinal reflexes as involving absolutely no psychological processes. On the basis of behavioural evidence from many experiments, Lewes concluded that the spinal column mediates many complex and specifically adaptive behaviours, showing striking resemblance to at least some of the behaviour (and consciousness?) of intact animals. According to Lewes, to treat the spinal cord as a reflex mechanism and the brain as a source of mind requires giving exclusive weight to introspective evidence. However, because introspective evidence is, by its nature, not open to public verification and replication, there can be no conclusive test to show the insentience of the spinal cord.

The trend in British neurophysiology was towards viewing the brain as a complex—and psychologically rich—reflex apparatus. This view achieved dominance with David Ferrier and Hughlings Jackson. In contrast, Lewes always insisted in treating spinal processes as including a psychological component (for example of sensation). Whether in the spine or in the brain, Lewes felt that an animate response was not just the mechanical effect of a stimulus but included an irreducible psychological factor, such as we would now describe as information processing steps. This emphasis on the psychologically active, dynamic nature of the lower parts of the central nervous system was submerged in later neurophysiology. Although later neurophysiologists acknowledge the role that muscle stretch receptors play in eliciting reflex responses, they simply do not address the question of what sorts of sensations might be elicited at the same time.

Lewes's work was in many ways outdated by the time it was published. With Lewes's help the journal *Mind* had begun appearing in 1876, and *Brain* a year later. Wundt's laboratory was already active, and psychological laboratories were even beginning to appear in America, where Peirce had begun to study the psychophysics of colour sensations. The study of the physiology (or psychology) of everyday life was being abandoned by specialists who were increasingly focusing on their own pieces in the puzzle of the human mind: experimental psychologists looking at sensations and reaction times, experimental physiologists analysing motor pathways, medical psychologists working with case studies in hysteria, epilepsy and other disorders. Lewes's death helped to increase this trend toward specialization, as he left money to found a studentship in physiology, explicitly on the German model, a bequest which did much to stimulate the improvement of British work in reductionist physiology over the next twenty years. Ironically, the greatest proponent of a non-psychological analysis of spinal function (combined with a dualistic interpretation of the brain/ mind), C.S.Sherrington, was one of three Nobel-Prize-winning physiologists whose studies were underwritten by Lewes's bequest. It would take more than half a century for another philosopher to appear with a comparable amount of physiological and psychological expertise and an interest in trying to understand behaviour and mind (Merleau-Ponty).

The positivism that dominated Europe by 1879 was much more Lewesian and Helmholtzian than Comtean. With regard to psychology and the study of mind, most so-called positivists were quasi-Spinozists. There was a continent-wide embracing of dual

aspect theory that began shortly after 1848 and achieved remarkable hegemony by 1879. It is striking that two of the leading British positivists (in the sense of early proponents of Comte), Lewes and Frederic Pollock, were among the earliest to publish extensively on Spinoza in English. Like Helmholtz, Lewes also attacked the remnants of a *Naturphilosophie* that insisted on finding hidden forces behind psychological as well as physical phenomena.

CONCLUSION

The year following Lewes's death, 1879, is often, if somewhat arbitrarily, treated as the year in which psychology as an experimental science was born. In that year, Wundt's laboratory became officially supported and active at Leipzig. Within the decade a host of more flexible and ultimately more influential experimentalists' careers were launched. By 1890 the most important of these scientists' careers were well established: G.E.Müller in Berlin, Alfred Binet in Paris and Francis Galton in England. These three researchers alone spun out streams of studies on a bewildering variety of topics, from sensory processes to reaction times, from individual differences to memory and cognition. William James's *Principles of Psychology* was essentially written over the course of this decade, and published in pieces alongside these experimentalists' work in the many new professional journals that were appearing. James's book represents two watersheds—the last great work strongly claimed by both psychologists and philosophers. Professionalization and separation was winning out.

Typically, the story is told that psychology as a professional discipline emerged from philosophy, as part of this professionalization, but this is only half right. It is equally the case that philosophy emerged from psychology. In the same decade that Galton, Binet and G.E. Müller (among others) were launching experimental psychology, replacing Mill's and Helmholtz's physiological epistemology with a kind of Lewesian positivism wedded to experimental methodologies, the 'neo-Kantians' were attacking 'psychologism' in epistemology, and Frege and Peirce were beginning their struggle to de-psychologize logic.

Psychology thus became a science unlike any other: a science without any ontological commitments, perpetually stuck within the anti-ontological climate of the 1870s. While chemistry and physics went on to mature out of this phase—leading to the great developments of 1900–10 (physical atoms, electrons, photons, the first quantum theory)—psychology maintained a deep aversion to all ontological theorizing. Ultimately, this led to that combination of behaviourism and 'operationalism' which dominated so much thinking about 'the mind' in the twentieth century.

At the same time as psychology abandoned ontology, philosophers abandoned the natural world. Afraid of a psychologism which threatened to eliminate first philosophy as a 'pure' intellectual discipline, a host of philosophical schools rediscovered transcendence, a trend very much in evidence even in the self-proclaimed anti-metaphysical scientists, such as Du Bois Reymond, whose famous 'ignorabimus' neatly carves out a place for the transcendent. Transcendental arguments in epistemology, metaphysics, and above all in logic, were offered to establish a 'pure philosophy'

untainted with any odour of quotidian reality. Some transcendentalists saw their salvation in the allegedly pure logical structure of language, others in the transcendental ideal structure at the heart of experience, still others in reviving Kant's method of transcendental argumentation.

The plea offered by James and countless others in the last quarter of the nineteenth century was that we should treat psychology as just another natural science, like chemistry. This plea misses a fundamental point. Unlike chemistry, psychology is about how we think (among other things). And a science of how we think should eventually tell us how to think, at least in the sense that it ought to reveal the laws and causes of good versus bad thinking. Were such a science to emerge it would be, at least in some sense, the queen of the sciences. By century's end, James doubted whether any such science had emerged, as he stated forthrightly at the outset of his *Talks to Teachers.* In contrast to James, Wundt, the self-proclaimed founder of experimental psychology, thus insisted on clearly demarcating the content of such a psychology. One could have an experimental science of sensation and response, but not an experimental science of cognition and thought. The study of cognition and other intentional states could be naturalistic, descriptive, historical and comparative, but never experimental and nomothetic. Wundtian experimental psychology, under the strong influence of the later Mill and the German agnostics, was itself definitely anti-psychologistic! Nevertheless, psychologism, in the sense of a master science telling us how we ought to think, was a strong presence throughout the latter part of the nineteenth century. It required an odd mixture of Platonism (in Frege) and neo-Kantianism (in Peirce and Wittgenstein) to eradicate psychologism in logic. And it required the very different geniuses of Russell and Husserl to eradicate psychologism in early twentieth-century philosophy. The fact that psychologism has returned, in the guise of artificial intelligence and cognitive science, suggests that the Victorian agnostics, like Kant and Reid, were unable to make their anti-metaphysical claims stick. It is intriguing that this oscillation between naturalism and anti-psychologism seems yet again to be pro-ducing new disciplines. If history is any guide, this cycle should continue.

ACKNOWLEDGEMENTS

This research was supported by grants from Franklin & Marshall College. I thank my Research Assistant, Sherry Anders, for consistently cheerful and unflagging help. It was at Rob Wozniak's suggestion that I first looked into G.H.Lewes's work seriously, for which I am grateful. Mike Montgomery gave me various prods and pokes of bibliographic and other advice. Stuart Shanker's questions, encouragement and suggestions have all been of great help.

CHAPTER 12
American pragmatism

Peirce

Cheryl Misak

INTRODUCTION

Charles Sanders Peirce (1839–1914), one of America's greatest philosophers, mathematicians, and logicians, was a difficult and not altogether pleasant character. That, combined with what the establishment regarded as moral lapses, resulted in the fact that he was thwarted in his attempts to obtain a permanent academic post and died a malnourished and impoverished outcast. He was dismissed from his brief stint at Johns Hopkins University, dismissed from his service with the US Coast Survey (a job handed to him by his father, its superintendent), and ostracized by his alma mater—Harvard University.

Despite this grim life, Peirce was the founder of pragmatism, semiotics, and a theory of truth and knowledge that is still popular today. He was a serious student of the history of philosophy and of science and he was generous in acknowledging the influence of others. One of the most important influences is Kant, of whom the young Peirce was a 'passionate devotee' ([12.1], 4:2).[1] It is from Kant, for instance, that Peirce inherits a quest for the categories, a penchant for the notion of continuity and a desire to develop an 'architectonic' system. But there is also a strong gust of medieval philosophy blowing throughout his work, Duns Scotus in particular. It is from here that Peirce gets his Scholastic realism, which is set against the nominalism and individualism of the British empiricists. But there is also a clear affinity between Peirce and those empiricists. For instance, Peirce credits Berkeley's arguments that all meaningful language be matched with sensory experience as the precursor of pragmatism: 'Berkeley on the whole has more right to be considered the introducer of pragmatism into philosophy than any other one man, though I was more explicit in enunciating it (letter to William James, 1903 ([12.12], 2:425)).

The volume and breadth of Peirce's work is staggering. But because he was unsuccessful in securing a permanent academic position, most of it went unpublished in his time. It lies in a huge bulk of manuscripts and scraps. His best known papers are those of the 1870s series in *Popular Science Monthly* called 'Illustrations of the Logic of Science'. These include 'How To Make Our Ideas Clear' and 'The Fixation of Belief'. His Lowell Lectures in 1898 and 1903 and his Harvard Pragmatism Lectures in 1903 also contain essential material. But much of what is important is only now being published in the definitive chronological edition.

THE PRAGMATIC MAXIM[2]

The 'spirit' of pragmatism is captured in the following maxim: 'we must look to the upshot of our concepts in order rightly to apprehend them' ([12.1], 5:4) There is, Peirce argues, a connection between knowing the meaning of a sentence or hypothesis and knowing what to expect if it is true. If a sentence has no consequences (if there isn't anything one could expect would be the case if it were true) then it lacks an important dimension. It lacks a property that we would have had to get right if we were to know what it means. Pragmatism labels such a hypothesis defective. Understanding requires knowledge of consequences and a sentence is legitimate only if it has consequences.

This criterion of legitimacy permeates Peirce's work. Not only does he disparage certain philosophical positions as pragmatically meaningless, but he argues that if we focus on the consequences of '*H* is true', 'the probability of *H* is *n*', '*x* is real', etc., we will adopt the best accounts of truth, probability, reality, etc. So the pragmatic maxim serves as a standard for determining which expressions are 'metaphysical rubbish' or 'gibberish' ([12.1], 8:191) and it serves as a methodological principle for formulating philosophical theories.

In 'How To Make Our Ideas Clear', Peirce publicly unveils pragmatism and sets out the maxim as follows:

> Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these is the whole of our conception of the object.
>
> ([12.2], 3:266)

Peirce suggests in this paper that knowing the meaning of an expression is exhausted by knowing its 'practical' effects, which he characterizes as 'effects, direct or indirect, upon our senses' ([12.2], 3:266). These effects can be described by conditionals of the sort: if you were to do *A*, you would observe *B*. He says:

> we come down to what is tangible and practical, as the root of every real distinction of thought, no matter how subtile *[sic]* it may be; and there is no distinction of meaning so fine as to consist in anything but a possible difference of practice.
>
> ([12.2], 3:265)

As an example of how the pragmatic maxim operates, Peirce examines the meaning of 'this diamond is hard'. He says that it means that if you try to scratch it, you will find that 'it will not be scratched by many other substances'. ([12.2], 3:266).

Notice that the consequence in this example is formulated as an indicative conditional, as a matter of what *will* happen. Peirce sees that if he formulates consequences in this manner, it makes little sense to describe a diamond which is in fact never scratched as being hard. He seems to be content with this conclusion in 'How To Make Our Ideas

Clear'. But when he considers the matter later, he always insists on a subjunctive formulation. He chides himself for making the nominalist suggestion that habits, dispositions or 'would-bes' are not real. A 'Scholastic realism' about dispositions and subjunctive conditionals must be adopted: a disposition is more than the total of its realizations and a subjunctive conditional is determinately correct or incorrect, whether or not the antecedent is fulfilled. The consequences which concern pragmatism are those which would occur under certain conditions, not those which will actually occur. His considered view about the unscratched diamond is that 'it is a real fact that it *would* resist pressure' ([12.1], 8:208).

This was not Peirce's only amendment to the pragmatic maxim. In his struggle to arrive at a suitable criterion of understanding and meaning, he sometimes suggested one very similar to the criterion we find later in logical positivism. The positivists' criterion effectively restricted knowledge to that which physical science is about; we can have knowledge only of that which is directly observable or verifiable. Anything else—metaphysics, for example—is literally meaningless. But Peirce is concerned with a much broader account of what is involved in linguistic competence and altered his maxim in order to make it more generous.

For one thing, Peirce himself inclined toward metaphysics and he does not want to do away with it altogether. In metaphysics 'one finds those questions that at first seem to offer no handle for reason's clutch, but which readily yield to logical analysis' ([12.1], 6:463). Metaphysics, 'in its present condition' is 'a puny, rickety, and scrofulous science' ([12.1], 6:6). But it need not be so, for many of its hypotheses are meaningful and important. It is the job of the pragmatic maxim to sweep 'all metaphysical rubbish out of one's house. Each abstraction is either pronounced to be gibberish or is provided with a plain, practical definition' ([12.1], 8:191).

Secondly, Peirce frequently claims that the pragmatic maxim captures only *a part* of what it is to know the meaning of an expression. In order to grasp a term, he argues, a threefold competence is required. The interpreter must be able to (1) pick out what objects the term refers to; that is, know Mill's 'denotation', Hamilton's 'extension' or 'breadth'; (2) give a definition of the term; that is, know Mill's 'connotation', Hamilton's 'intention' or 'depth'; (3) know what to expect if hypotheses containing the term are true; that is, know the consequences of hypotheses containing the term.

Whereas his predecessors identified the first two sources of meaning, Peirce thinks that his contribution was to locate the important third source. He takes his three aspects of understanding to spell out completely what someone must be able to do if she grasps a concept or knows the meaning of an expression.

But none the less, the pragmatic maxim is supposed to be a criterion for meaning identity. Peirce argues that a purported difference which makes no practical difference is spurious; if two hypotheses have the same set of subjunctive conditional consequences, then they express the same content. It is pointless to suggest that they differ in denotation or connotation.

Thirdly, Peirce at times tries to divert the pragmatist's gaze from sensory experience. His account of experience is very generous: any belief that is compelling, surprising, impinging, unchosen, involuntary or forceful is a perception. And such beliefs need not arise from the senses.

He takes there to be two kinds of experience—'ideal' and 'real'. The latter is sensory experience and the former includes experience in which 'operations upon diagrams, whether external or imaginary, take the place of the experiments upon real things that one performs in chemical and physical research' ([12.1], 4:530).

These diagrammatic experiments or thought experiments figure in mathematical and deductive inquiry. They involve 'experimenting upon [an] image in the imagination, and of observing the result so as to discover unnoticed and hidden relations among the parts' ([12.1], 3:363). The mathematician, for instance, draws subsidiary lines in geometry or makes transformations in algebraic formulae and then observes the results: 'his hypotheses are creatures of his own imagination; but he discovers in them relations which surprise him sometimes'. ([12.1], 5:567). Since surprise is the force of experience, the upshot of such reasoning counts as experience.

What this means is that Peirce, unlike his verificationist predecessors (Hume, Comte) and successors (the logical positivists), wants all hypotheses to be exposed to the pragmatic maxim; he does not exempt formal (or what are now called 'analytic') sentences. Logical and mathematical hypotheses can meet the criterion because there is a kind of experience relevant to them. And some metaphysical hypotheses meet the criterion as well. They must have consequences, Peirce argues, for ordinary, everyday, experience, by contrast with experiences in technical experimental contexts and by contrast with experiences in diagrammatic contexts.

TRUTH AND REALITY

Peirce applies the pragmatic maxim to the metaphysical debate on the nature of truth and reality. The philosopher must look to our everyday practices and see what account of truth would be best suited for them: 'We must not begin by talking of pure ideas,—vagabond thoughts that tramp the public roads without any human habitation,—but must begin with men and their conversation' ([12.1], 8:112).

The correspondence theory, he argues, lacks such human habitation. It holds that a true hypothesis is one which is in agreement with an unknowable 'thing-in-itself'. But:

> You only puzzle yourself by talking of this metaphysical 'truth' and metaphysical 'falsity' that you know nothing about. All you have any dealings with are your doubts and beliefs… If your terms 'truth' and 'falsity' are taken in such senses as to be definable in terms of doubt and belief and the course of experience…well and good: in that case, you are only talking about doubt and belief. But if by truth and falsity you mean something not definable in terms of doubt and belief in any way, then you are talking of entities of whose existence you can know nothing, and which Ockham's razor would clean shave off. Your problems would be greatly simplified, if, instead of saying that you want to know the 'Truth', you were simply to say that you want to attain a state of belief unassailable by doubt.
>
> ([12.1], 5:416).

Peirce's argument here is that if one offered an account of 'H is true' in terms of its consequences for doubt, belief and perceptual disappointment, one would be offering a pragmatic elucidation of truth. And that, if it were a correct specification of the consequences, would be a satisfactory account of truth. But a definition of truth which makes no reference to belief, doubt and experience is an empty definition of truth. It is useful only to those who have never encountered the notion.

Peirce sometimes states this objection to the correspondence theory by labelling it a 'transcendental' account of truth ([12.1], 5:572). Such accounts regard truth 'as the subject of metaphysics exclusively'—spurious metaphysics, not pragmatically legitimate metaphysics. On the correspondence definition, truth transcends experience; it has no consequences for inquiry. He says:

> The *Ding an sich*…can neither be indicated nor found. Consequently, no proposition can refer to it, and nothing true or false can be predicated of it. Therefore, all references to it must be thrown out as meaningless surplusage.
>
> ([12.1], 5:525)

If we look at the experience of inquirers which seems most relevant to truth—the evidence they have for and against hypotheses—the correspondence theory is speechless. For on that account, there is an unbridgeable gap between what we can have evidence for and the inaccessible reality. We could have the best possible evidence for an hypothesis and yet that hypothesis might fail to be true. The correspondence theory does not tell us what we can expect of a true hypothesis and so it is not capable of guiding us in our actions and inquiries. If truth is the aim of inquiry, then on the correspondence construal, enquirers are left completely in the dark as to how they should conduct their investigations. The aim is not, Peirce says, 'readily comprehensible' ([12.1], 1:578). How could anyone aim for a sort of truth that transcends experience? How could an enquirer develop a means for achieving that aim?

In anticipation of certain kinds of naturalized epistemologies, Peirce focuses on what he thinks the transcendentalist has lost sight of—the link between truth and inquiry. The pragmatic account deals with the common experience that constitutes inquiry, and so it offers a conception of truth that can be a guide for inquiry.

On Peirce's view, 'A true proposition is a proposition belief in which would never lead to…disappointment' ([12.1], 5:569). This is an account of what we can expect from a true belief: if we were to inquire into *H*, we would find that *H* would encounter no recalcitrant experience. We can predict that if we were diligently to inquire about *H*, *H* would not, in the end, be overturned by experience. An alternative way of making the point is to say that we would expect the following: if inquiry with respect to *H* were to be pursued as far as it could fruitfully go (i.e. far enough so that the hypothesis would no longer be improved upon), *H* would be believed (it would not be doubted). For if *H* would be believed after such a prolonged inquiry, then *H* would not have been overturned by experience; it would not have been put into doubt. A true belief is a permanently settled belief.

Peirce's view of reality is connected to his view of truth. The consequence of a thing's being real is that the hypothesis asserting its reality would be, if inquiry relevant to it

were pursued, perfectly stable or doubt-resistant. For a consequence of a thing's being real is that, if we were to inquire into issues for which it is relevant, it would in the long run force itself on our attention. The pragmatic view is that reality is the 'object' of true beliefs—it is what true beliefs are about. Reality is what beliefs in the final opinion would fix on.

This account of reality, Peirce argues, fulfils the definition of reality as that which is independent of whatever 'you, I, or any number of men' think. We have seen that Peirce is a realist about subjunctives. What would be believed to be real is thus independent of what is believed to be real at any particular time. The real 'is that which, sooner or later, information and reasoning would result in, and which is therefore independent of the vagaries of you and me' ([12.2], 2:239) Peirce thinks that this makes reality 'objective'. ([12.2], 3:29).

He makes the same point about truth. What would be ascertained to be true would be so ascertained whatever anyone here and now thinks. A hypothesis may be believed, then doubted and then believed again, but this does not affect whether it would be believed at the end of a prolonged inquiry. Independently of whatever any 'definite' group of inquirers may think about the truth-value of *H*, *H* either would be or would not be a member of the final opinion (12.1], 5:565). Thus the truth-value of *H* is an objective matter—it does not depend on what anyone at any particular point happens to think.

SEMIOTICS

Peirce was a pioneer in semiotics. Not only is he responsible for the distinction between type ('human' as a general term) and token ('human' as applied to various objects), but he developed a complex map of signs which covers sixty-six classes, from which sprout 59,049 varieties.

His theory of signs has interpretation at its centre. For Peirce holds that the sign-referent relation is not able, on its own, to uphold a complete account of representation. Representation is triadic: it involves a sign, an object and an interpreter. Each aspect of this representation relation corresponds to one of the elements in Peirce's division of signs into icons, indices and symbols. And in each of these, one or another aspect of linguistic competence is most prominent.

Icons are signs that exhibit their objects by virtue of similarity or resemblance. A portrait is an icon of the person it portrays and a map is an icon of a certain geographical area. Peirce argues that the meaning of iconic signs lies mostly in their connotation; what makes a painting or a map an icon is that its qualities or attributes resemble the qualities or attributes of its object.

Indices are signs that indicate their objects in a causal manner; an index 'signifies its object solely by virtue of being really connected with it' ([12.1], 3:360). A symptom is an index of a disease and smoke is an index of fire. The essential quality of an index is its ability to compel attention. A pointing finger, a knock on the door or a demonstrative pronoun, such as 'there' or 'that', draws attention to its object by getting the interpreter to focus on the object. So an index, by being object-directed, has its denotation or extension as its 'most prominent feature' ([12.1], 8:119). An index picks out or indicates its object;

it points to ‘that, that and that’ as its extension.

A symbol is a word, hypothesis or argument which depends on a conventional or habitual rule; a symbol is a sign ‘because it is used and understood as such’ ([12.1], 2:307) Symbols have ‘principle’ or pragmatic meaning; they have ‘intellectual purport’.

Peirce contrasts pragmatic meaning with ‘internal’ meaning (which he relates to icons and connotation) and with ‘external’ meaning (which he relates to indices and denotation). He suggests that the pragmatic meaning of symbols has to do with a ‘purpose’ ([12.1], 8:119). A symbol has pragmatic meaning because if the utterer knows how interpreters habitually interpret a sign, she can use the sign to cause a specific effect in the interpreter. And Peirce calls this effect the ‘interpretant’ of the sign. If, for instance, I write ‘dog’, I intend the sign to cause a certain effect in the interpreter (perhaps I want the interpreter to think of a dog) whereas if I write ‘odg’, I do not, as ‘odg’ is not a conventional sign. Or if I assert ‘That bridge has a loose plank’, I might want the interpreter to be careful when crossing the bridge. Peirce characterizes an assertion as the attempt to produce a disposition in an interpreter; it is ‘the deliberate exercise, in uttering the proposition, of a force tending to determine a belief in it in the mind of an interpreter’ ([12.4], 4:249).

Notice that if pragmatic meaning is about this sort of practical consequence, it is no longer about ‘effects, direct or indirect, upon our senses’. Pragmatic meaning, rather, involves consequences for action or thought. In 1905 we find Peirce offering this version of the pragmatic maxim: ‘The entire intellectual purport of any symbol consists in the total of all general modes of rational conduct which, conditionally upon all the possible different circumstances and desires, would ensue upon the acceptance of the symbol’ ([12.1], 5:438). ‘Rational conduct’, although Peirce thinks that it will eventually manifest itself in a modification of the interpreter’s disposition to behave, includes the conduct of one’s thought.

This twist in the pragmatic maxim—that the acceptance of a hypothesis must have effects on an interpreter’s train of thought—coincides with a development in the early 1900s in Peirce’s theory of signs. That development is a theory of interpretants and Peirce at times locates pragmatic meaning within this theory.

He distinguishes three types of interpretants. The ‘immediate’ interpretant is the fitness of a sign to be understood in a certain way; the ‘dynamical’ interpretant is the actual effect a sign has on an interpreter, and the ‘final’ interpretant is the effect which eventually would be decided to be the correct interpretation. Pragmatic meaning, Peirce says, lies in a kind of dynamical interpretant: the ‘ultimate logical interpretant’. A sign, Peirce argues, sparks a subsequent sign, or a logical interpretant, in the mind of the interpreter, and since the logical interpretant is itself a sign, an infinite chain of interpretation, development, or thought, is begun. Peirce stops the regress by introducing the notion of an ‘ultimate logical interpretant’ or a ‘habit-change’. He follows Alexander Bain in taking a belief to be a habit or disposition to behave. And so this new habit is a belief or a modification of the interpreter’s tendencies towards action. The pragmatic meaning of an expression, according to Peirce’s theory of signs, is the action (which includes the action of subsequent thought, and which ends in a disposition to behave) that arises after an interpreter accepts it.

THEORY OF INQUIRY

The notion of inquiry occupies a central place in Peirce's thought. For the most part, his income was from employment in the United States Coast and Geodetic Survey, where he made numerous and significant contributions. Philosophy, he insisted, must get along with other branches of inquiry. The following motto 'deserves to be inscribed upon every wall of the city of philosophy: Do not block the path of inquiry' ([12.1] 1:135).

Peirce characterizes inquiry as the struggle to rid ourselves of doubt and achieve a state of belief. An inquirer has a body of settled belief; a set of beliefs which are, in fact, not doubted. These beliefs, however, are susceptible to doubt, if it is prompted by some 'positive reason', such as a surprising experience ([12.1], 5:51). We have seen that Peirce takes experience to be that which impinges upon us—experience, he says, teaches us 'by practical jokes, mostly cruel' ([12.1], 5:51). When experience conflicts with an inquirer's belief, doubt is immediately sparked. And doubt 'essentially involves a struggle to escape' ([12.1], 5:372 n.2). Inquiry is that struggle to regain belief. The path of inquiry is as follows: belief…surprise…doubt…inquiry… belief….

Peirce does not take these points to be mere observations about human psychology; he thinks that psychology should be kept out of logic and the theory of inquiry. Doubt and belief, although they do have psychological aspects, such as making the inquirer feel comfortable or uncomfortable, are best thought of in terms of habits. A 'belief-habit' manifests itself in an expectation: if we believe *H*, then we habitually expect the consequences or the predictions we derive from *H* to come about when the appropriate occasion arises. Thus inquirers are thrown into doubt when a recalcitrant experience upsets or disrupts a belief or expectation. There are three stances an inquirer may have with respect to a hypothesis: believe it, believe its negation or consider the matter open to inquiry. Only in the third stance are we left without a habit of expectation and thus it is agnosticism which is the undesirable state. That is, doubting whether an hypothesis is true is not equivalent to believing that it is false, rather, it is not knowing what to believe. What is wrong with this state is that it leads to paralysis of action. An inquirer has some end in view, and two different and inconsistent lines of action present themselves, bringing the inquirer to a halt: 'he waits at the fork for an indication, and kicks his heels… A true doubt is accordingly a doubt which really interferes with the smooth working of the belief-habit' ([12.1], 5:510). Doubt arises because of not knowing how to act. And action can include action in diagrammatic and thought experiments.

Peirce's theory of inquiry has a certain kind of empiricism at its core. Inquirers aim for beliefs that fit with experience. When we replace a belief which has come into doubt, that new belief stands up better than the old one. So we accept it, act on it and think that it is true. But we know very well that it eventually might be overthrown and shown to be false by experience. Peirce adds the more contentious claim that what we aim for is permanently settled beliefs. When we have beliefs that would for ever withstand the tests of experience and argument, he holds that there is no point of refusing to confer upon them the title 'true'. Only a spurious desire for transcendental metaphysics will make one want to distinguish perfectly good beliefs from true beliefs.

A problem faces Peirce here. If beliefs could be settled by a religious authority, or by a charismatic guru or by astrology, so that they were permanently resistant to doubt, there seems to be, on his account, no reason for criticizing them. Peirce considers different methods of fixing belief and suggests that it is hard *really* to end the irritation of doubt.

The method of tenacity, or holding on to your beliefs come what may, will not work, Peirce says, because doubt will be sparked when one notices that the opinions of others differ from one's own. Beliefs produced by the method of authority (fixing beliefs according to the dictates of a State, religion, etc.) will similarly be subject to doubt when one notices that those in other States or religions believe different things. Beliefs produced by the *a priori* method (adopting beliefs which are agreeable to reason) will eventually be doubted when it is seen that what the experts take as being agreeable to reason shifts like a pendulum and is really a matter of intellectual taste. None of these methods will produce permanently settled belief because they have a self-destructive design; the beliefs settled by them eventually would be assailed by doubt.

The agent of destruction which Peirce sees in each of the specious methods seems to be a purported fact about our psychological makeup: if an inquirer believes an hypothesis, and notices that other inquirers do not believe it, that first inquirer will be thrown into doubt. This impulse, Peirce says, is 'too strong in man to be suppressed, without danger of destroying the human species' ([12.2], 3:250). If this psychological hypothesis expresses a universal fact about us, then the unsatisfactory methods will indeed prove unreliable in the long run. They will not produce permanently settled belief and we should refrain from using them.[3]

There are two other cornerstones to Peirce's theory of inquiry: critical commonsensism and fallibilism. Critical commonsensism is a position about how we ought to regard those beliefs which are settled. It holds that there are many things which inquirers do not doubt and that inquiry must start with a background of beliefs which are not doubted. A body of settled belief is presupposed for the operation of inquiry in that there has to be something settled for surprise to stir up.

This doctrine arose as a response to Peirce's conception of Descartes' project—a systematic attempt to bring into doubt all hypotheses about which error is conceivable. Peirce argued that such doubts would be 'paper' doubts. They are not genuine and they cannot motivate inquiry. The mere possibility of being mistaken with respect to what one believes is never a reason to revise those beliefs. Any of our beliefs might be false, but it would be absurd to doubt them all because of this. If we did, we would not possess a body of stable belief by which to judge new evidence and hypotheses, and hence, we would block the path of inquiry. We can doubt one belief and inquire, but we cannot doubt all of our beliefs and inquire. Peirce's point against Descartes is that if we were to set the requirements on knowledge as high as Descartes does, we would have nothing left to go on. He says,

> there is but one state of mind from which you can 'set out', namely, the very state of mind in which you actually find yourself at the time you do 'set out'—a state in which you are laden with an immense mass of cognition already formed, of which you cannot divest yourself if you would… Do you call it doubting to write down on a piece of paper that you doubt? If so, doubt has nothing to do

with any serious business.

([12.1], 5:416)

So Peirce is not concerned with sceptical questions about foundations for certainty, and his arguments are not addressed to those who are.

But he is also a 'contrite fallibilist', holding that all our beliefs can be doubted; that is, that none of them are certain. There is a tension here: how can it be that all our beliefs are fallible, or subject to doubt, but, nevertheless, some of our beliefs must not be doubted if inquiry is to be possible?

Peirce's reconciliation of fallibilism with critical commonsensism is made in terms of his notion of truth. He thinks that many of our beliefs are indeed those which would be included in the final opinion, but since we cannot know for any given belief whether or not it would be in that opinion, we cannot know that it is true. That is, we do not know if the antecedent of this subjunctive conditional is fulfilled: 'if inquiry were pursued as far as it could fruitfully go, then *H* would be believed'. Inquiry may or may not have been pursued far enough with respect to *H*, and so we cannot have certainty with respect to any belief.

But the uncertainty or fallibility that in principle accompanies every one of our beliefs does not mean that we should doubt our settled beliefs. 'Practically speaking', he says, many things are 'substantially certain' ([12.1], 1:152); we do not doubt them. While 'it is possible that twice two is not four…it would be difficult to imagine a greater folly than to attach any serious importance to such a doubt' ([12.1], 7:108).

But substantial certainty is different from the 'absolute certainty' which would result from knowing that we have permanently settled belief. We may have this settled opinion about many questions, but we must not infer that we 'perfectly know when we know'. Again, we cannot know that any given hypothesis is permanently settled upon or true—we cannot have absolute certainty. Nevertheless, in every state of intellectual development and information, there are things that seem to us sure 'so that even though we tell ourselves that we are not sure, we cannot clearly see how we fail of being so' ([12.1], 4:64). Practi-cally, we must treat some hypotheses as certain. Settled beliefs must be regarded as infallible, in the sense that the inquirer does not doubt them for the purposes of inquiry; science has 'established truths' to be used as premisses in further deliberation ([12.1], 1:635). In this sense, we do not doubt what we believe, but in another sense, each of our beliefs can, or could, be doubted.

Peirce's theory of inquiry provides the key to understanding his view of the growth of knowledge and the progress of science. His position is that science 'is not standing upon the bedrock of fact. It is walking upon a bog, and can only say, this ground seems to hold for the present. Here I will stay till it begins to give way' ([12.1], 5:589).

Accepted hypotheses and theories are stable until they are upset by experience. They are as good as they can be, given the state of evidence, technology, argument, etc. Knowledge is rebuilt bit by bit when experience forces inquirers to revise their beliefs. The rebuilding principle requires modification of our beliefs in the light of recalcitrant experience and Peirce argues that we cannot help but adopt this principle. We do have some reason to believe that, in rebuilding, we are in some sense getting closer to the truth. For the new beliefs will get along with experience better than the old ones. True beliefs

are those which would, in the end, get along with experience and one explanation of our beliefs achieving more and more fit with experience is that a good number of them are true. A good number of them would be permanently doubt-resistant.

But Peirce's picture is not one of placing indubitable building blocks upon each other as we progress towards the truth. Rather, the picture is one of doubt (recalcitrant experience) forcing us to inquire until we reach another tentative doubt-resistant belief. The ground upon which inquiry walks is tenuous and it is only the danger of losing our footing that makes us go forward. Doubt and uncertainty provide the motive for inquiry. All our beliefs are fallible and when an agent accepts a belief, she does so with the knowledge that it might very well prove to succumb to surprise. But if the agent knows that the belief is the result of a method which takes experience seriously, then she is warranted in accepting it, asserting it and acting upon it.

In addition, Peirce's theory of inquiry invokes two regulative hopes; assumptions, such that, without making them, the participants in a practice could make no sense of that practice. We must, Peirce says, hope or assume that the community will continue indefinitely and we must hope that there would be, if inquiry were pursued far enough, a final settled answer to 'the particular questions with which our inquiries are busied' ([12.1], 6:610). He says,

> a reasonable disputant disputes because he hopes, or at least, goes upon the assumption that the dispute will come to something; that is to say, that both parties will at length find themselves forced to a common belief which will be definitive and final. For otherwise, why dispute?
>
> ([12.1], 2:29)

Inquiry is the asking of questions, and a presupposition of inquiry is that the questioner hopes for an answer. We have, Peirce says, some ground for this hope because all sorts of questions that seemed at one time to be completely resistant to resolution have been resolved.

LOGIC: DEDUCTION, INDUCTION, ABDUCTION

Peirce described himself first and foremost as a logician and despaired that the current state of philosophy in America was such that most found formal logic to be too difficult. He classified inference into three types: deduction, induction and abduction (which he also called retroduction or hypothesis) and made significant contributions to the study, of each. Indeed, the very study of abduction, what is today known as inference to the best explanation, is due to Peirce.

Peirce's contributions to deductive logic are very impressive, although today it is Frege, not Peirce, who is regarded as bringing modern logic into the world. Peirce developed a logic of relations and quantifiers independently of, and at roughly the same time as, Frege, discovered the Sheffer Stroke twenty years before Sheffer, and invented a notation (utilizing normal forms) very similar to the one still in use. In mathematics, he anticipated Dedekind on the difference between finite and infinite sets and independently

developed arguments about infinity similar to Cantor's. Unfortunately, setting out the background to these developments and adequately characterizing them is beyond the scope of this chapter (See Dauben [12.6], Putnam [12.13] and Dipert [12.7]).

Peirce is also known for his work on induction. Some see in his writing an anticipation of Reichenbach's probabilistic response to Hume's scepticism about induction while others see an anticipation of the Neyman-Pearson confidence interval approach to testing statistical hypotheses (see Ayer [12.5], Lenz [12.9], Levi [12.10] and Hacking [12.8]).

Peirce called the sort of inference which concludes that all *A*s are *B*s because there are no known instances to the contrary 'crude induction'. It assumes that future experience will not be 'utterly at variance' with past experience ([12.1], 7:756). This is, Peirce says, the only kind of induction in which we are able to infer the truth of a universal generalization. Its flaw is that 'it is liable at any moment to be utterly shattered by a single experience' ([12.1], 7:157).

The problem of induction, as Hume characterizes it, is about crude induction; it is about the legitimacy of concluding that all *A*s are *B*s or the next *A* will be a *B* from the fact that all observed *A*s have been *B*s. Peirce assumes that Hume's problem is straightforwardly settled by fallibilism and critical commonsensism. We do, and should, believe that, say, the sun will rise tomorrow, yet it is by no means certain that it will. To show that induction is valid, we need not show that we can be certain about the correctness of the conclusion of a crude inductive inference. Fallibilism holds that this is a pipe dream. What we have to show, rather, is that induction is a reliable method in inquiry.

Peirce holds that it is a mistake, anyway, to think that all inductive reasoning is aimed at conclusions which are universal generalizations. The strongest sort of induction is 'quantitative induction' and it deals with statistical ratios. For instance:

> *Case:* These beans have been randomly taken from this bag
> *Result:* Two-thirds of these beans are white
> *Rule:* Therefore two-thirds of the beans in the bag are white

That is, one can argue that if, in a random sampling of some group of *S*s, a certain proportion *r/n* has the character *P*, the same proportion *r/n* of the Ss have *P*. One concludes from an observed relative frequency in a randomly drawn sample a hypothesis about the relative frequency in the population.

Peirce is concerned with how inductive inference forms a part of the scientific method; how inductive inferences can fulfil their role as the testing ground for hypotheses. Quantitative induction can be seen as a kind of experiment. We ask what the probability is that a member of the experimental class of the Ss will have the character *P*. The experimenter then obtains a fair sample of Ss and draws from it at random. The value of the proportion of Ss sampled that are *P* approximates the value of the probability in question. When we test, we infer that if a sample passes the test, the entire population would pass the test. Or we infer that if 10 per cent of the sample has a certain feature, then 10 per cent of the population has that feature.

Peirce took the three types of inference to form the scientific method. The role played by induction is to test hypotheses. The job of abductive inference is to provide

hypotheses for this testing. Peirce's settled view on abduction is that it is 'where we find some very curious circumstance, which would be explained by the supposition that it was a case of a certain general rule, and thereupon adopt that supposition' ([12.2], 3:326). The form it takes is:

> The surprising fact, C, is observed; But if *A* were true, C would be a matter of course. Hence, there is reason to suspect that *A* is true.
>
> ([12.1], 5:189)

Peirce argued with Paul Carus about when an explanation is called for. Carus claimed that irregularity demands an explanation and Peirce disagreed. Nobody, he says, is 'surprised that the trees in a forest do not form a regular pattern, or asks for any explanation of such a fact' ([12.1], 189). Peirce suggests that irregularity is 'the overwhelmingly preponderant rule of experience, and regularity only the strange exception'. A mere irregularity, where no definite regularity is expected, he says, creates no surprise; it excites no curiosity. And it is a surprise or an anomaly that throws us into doubt or demands an inquiry to explain the phenomenon. It is an *unexpected* regularity or the breach of an existing regularity that makes a demand for explanation. It is the interruption of a habit of expectation (a belief) that calls for an explanation.

Abduction is 'the process of forming an explanatory hypothesis' ([12.1], 5:171) for such regularities. These hypotheses, however, are merely conjectures; we must 'hold ourselves ready to throw them overboard at a moment's notice from experience' ([12.1], 1:634). For an abductive inference 'commits us to nothing. It merely causes a hypothesis to be set down upon our docket of cases to be tried' ([12.1], 5:602).

So the first stage of inquiry is arriving at a conjecture or an explanatory hypothesis. Peirce argued that abduction and induction are 'ampliative' and deduction is 'explicative'. In explicative inference, the conclusion follows from the premisses necessarily; in ampliative inference, the conclusion amplifies rather than explicates what is stated in the premisses. He argues that ampliative inference is the only kind that can introduce new ideas into our body of belief. Being a form of ampliative inference, abduction allows us to infer, or at least conjecture, from the known to the unknown. We can infer a hypothesis to explain why we observed what we did.

The second stage is to deduce consequences or predictions from the hypothesis. The 'purpose' of deduction is 'that of collecting consequents of the hypothesis'. The third stage is that of 'ascertaining how far those consequents accord with Experience' ([12.3], 841:44). By induction we test the hypothesis: if it passes, it is added to our body of belief.

Peirce sees that the validity of abductive inference is hard to characterize. Its conclusion is not even asserted to be true, for it is a mere conjecture. He says:

> The hypothesis which it problematically concludes is frequently utterly wrong in itself, and even the method need not ever lead to the truth; for it may be that the features of the phenomena which it aims to explain have no rational explanation at all. Its only justification is that its method is the only way in which there can be any hope of attaining a rational explanation.
>
> ([12.1], 2:777)

He argues that the reason we are justified in making abductive inferences is that, if we are to have any knowledge at all, we must make them. A logician, Peirce says, should have two goals—he or she should 'bring out the amount and kind of *security*…of each kind of reasoning' and should bring out the 'uberty, or value in productiveness, of each kind'. ([12.1], 8:384) Abduction is such that 'though its *security* is low, its *uberty* is high'. ([12.1], 8:388). It is the other two kinds of inference to which the notions of security and validity more aptly apply.

THE CATEGORIES

Peirce expended a great deal of intellectual energy engaging in a project which absorbed Aristotle and Kant—the categories. Peirce's ubiquitous classificatory scheme—the categories of firstness, secondness, and thirdness—is designed to cover any object of thought. It is a classificatory scheme that takes each category to be an 'independent and distinct element of the triune Reality' ([12.1] 5:431). The doctrine is extremely complex, vague and difficult to understand, and, like pragmatism, it permeates Peirce's work.

Peirce had three methods for arriving at his list of categories. The first and earliest one is found in the 1867 'On a New List of Categories'. The project is a Kantian one—to find out what 'is' or 'has being' by 'reducing the manifold of sense impressions to unity' via an analysis of the proposition. The second method is an argument from phenomenology, which 'ascertains and studies the kinds of elements universally present in the phenomenon' or 'whatever is present at any time to the mind in any way'. ([12.1], 1:186). Both of these methods aim to show that everything that we experience or identify, i.e. anything that 'is', has an element of each of the three categories in it, and that we do not experience anything that goes beyond the three categories.

Both the Kantian and the phenomenological derivations of the categories rest on the Aristotelian/Scholastic method of analysis of prescission. This method separates or distinguishes different elements of a concept so that, although we cannot imagine a situation in which one of them is actually isolated, we can tell that the elements are distinct. We can 'suppose' one without the other, for we can, by attending to one feature and neglecting others, isolate features of phenomena which are not in fact separable. We can, for instance, suppose space without colour even though colourless space is not imaginable. Prescission, however, is not reciprocal, as it is a matter of discerning a logical priority of notions. Hence, we cannot prescind colour from space—we cannot suppose colour without spatial extension.

With respect to the categories, Peirce argues that we can abstract or prescind certain notions from experience and classify them as belonging to one or another of the categories. We can prescind firstness from secondness and we can prescind both from thirdness, but we cannot prescind in the other direction.

So the categories are designed to describe the general features of each of the classes of elements that come before the mind or are experienced. Each class is distinct, but its members cannot stand in isolation. Each of the categories is present in everything we experience, but there are many cases in which one or the other of the categories is emphasized or predominant: 'although they are so inextricably mixed together that no

one can be isolated, yet it is manifest that their characters are quite disparate' ([12.1], 1:284). And the list of three is all that is needed.

Perhaps the easiest way to set out Peirce's doctrine of categories is to concentrate on his third derivation, that which rests on the logic of relations. (This method, however, is discussed by Peirce as being part of phenomenology.) Here the categories are represented by *n*-place relations. Peirce argued that all relations fall into one of three fundamental classes: monadic, dyadic and triadic. Each is irreducible to the others, and all predicates with more than three places are reducible to triadic ones. For instance, '*a* is red' is monadic, '*a* hit *b*' is dyadic and '*a* gives *b* to *c*' is triadic. A four-place predicate such as '*a* put *b* between *c* and *d*' is reducible to two three-place ones: '*a* put *b* in spot *e*'; 'spot *e* is between *c* and *d*'. 'Gives', on the other hand, is not reducible to '*a* put *b* down' and '*c* picked *b* up', as the latter set fails to express the intention of *a* that *c* should have *b*.

The results of each of the three ways of inquiring into the ultimate categories merge. Here is a brief description of those results, one which does not undertake the intimidating task of sorting out the relationships between all of the things that supposedly manifest each category.

The third category involves a medium or connecting link between two things; irreducibly triadic action is such that an event *A* produces an event *B* as a means to the production of an event *C*. Thirdness is characteristically manifested in psychological concepts. For instance, Peirce argues that representation is such that an interpreting thought mediates between sign and object. (One route to Peirce's claim that all experience is a matter of thirdness is via his argument that everything that we experience is of the nature of a sign or representation. There is no experience independent of our representation of it.) Similarly, we cannot grasp what it is for *a* to give *b* to *c* without the notion of intention mediating between *a* putting *b* down and *c* picking up *b*. There must be an intention to give on *a*'s part and a realization of that intention on *b*'s part. Peirce also says that law and necessity manifest thirdness. A law, or a necessary connection, mediates between the action of one thing upon another, making it more than an accident that they behaved in the way in which they did. Continuity and generality are other instances of thirdness.

We can cognitively isolate secondness as the duality of action and reaction without any mediating force. It is brute existence and hence is the modality of actuality. It is found (by prescission) most clearly in the notions of struggle, action/reaction, cause/effect, and brute force. The second category is one 'which the rough and tumble of life renders most familiarly prominent. We are continually bumping up against hard fact' ([12.1], 1:324). For

> We can make no effort where we experience no resistance, no reaction. The sense of effort is a two-sided sense, revealing at once a something within and another something without. There is binarity in the idea of brute force; it is its principal ingredient.
>
> ([12.1], 2:84)

A First is a simple monadic element. Peirce says that it suggests spontaneity, and it is real 'regardless of anything else'. In virtue of its very nature, it is indescribable; it can only be

grasped by prescission:

> It cannot be articulately thought: assert it, and it has already lost its characteristic innocence; for assertion always implies a denial of something else. Stop to think of it, and it has flown!…that is first, present, immediate, fresh, new, initiative, original, spontaneous, free, vivid, conscious, and evanescent. Only, remember that every description of it must be false to it.
>
> ([12.1], 1:357)

These 'qualities of feeling' are mere possibilities:

> I do not mean the sense of actually experiencing these feelings… that is something that involves these qualities as an element of it. But I mean the qualities themselves which, in themselves, are mere may-bes, not necessarily realized.
>
> ([12.1], 1:287)

So the first category is that of possibility.

One upshot of Peirce's doctrine of categories is that he thinks that reality comes in three grades. He is a 'realist' with respect to all of the categories—possibility, actuality and generality are real. He insists that 'the *will he's*, the actually *is's*, and the *have beens* are not the sum of the reals—they only cover actuality. There are besides *would be's* and *can be's* that are real' ([12.1], 8:216). And his 'Scholastic realism' has it that laws or thirds are real; they are not mere mental constructions.

Peirce takes nominalism—the doctrine that '*laws* and general *types* are figments of the mind' ([12.1], 1:16)—to be pernicious. He says, 'the property, the character, the predicate, *hardness*, is not invented by men, as the word is, but is really and truly in the hard things and is one in them all, as a description of habit, disposition, or behavior' ([12.1], 1:27 n.1).

Peirce thinks that the fact that we can predict things ought to convince us of realism about generals. Realism explains prediction, for, on that theory, laws and dispositions have causal efficacy: 'if there is any *would be* at all, there is more or less causation; for that is all that I mean by causation' ([12.1], 8:225 n.10). If a prediction has a tendency to be fulfilled, it must be the case that future events have a tendency to conform to a general rule. Peirce concludes that some laws or generals are real. Laws and dispositions mediate between possibility (Firstness) and actuality (Secondness)—it is the law that makes the possible actual, for laws or general patterns cause their instances.

But Peirce does not think that possibilities and generals actually exist; universals or generals are not 'things'. The realm of existence is the second category, and so possibilities and generals are real but not existent.

METAPHYSICS

The doctrine of categories is not Peirce's only metaphysical venture. But the briefest

sketch of these metaphysical positions, which seem to be in a different spirit from the inquiry-directed pragmatic epistemology described in the first six sections, is all that space allows.

Peirce was set against determinism or necessitarianism, which he took to be the position that 'every single fact in the universe is precisely determined by law' ([12.1], 6:36). His 'Tychism', on the other hand, had it that there is absolute chance in the universe—there is spontaneous deviation from the laws of nature. Peirce took a corollory of Tychism to be that physical laws are statistical, something which physics now takes for granted.

Tychism is tied to Peirce's view of evolutionary cosmology, for Tychism has it that there is a tendency toward diversification in the universe. Laws, Peirce argued, evolved from nothing or from 'pure possibility'. The starting point 'was not a state of pure abstract being. On the contrary it was a state of just nothing at all, not even a state of emptiness, for even emptiness is something' ([12.1], 6:215). He usually says that it was pure Firstness. Recall that spontaneity is paradigmatic of Firstness. It is a state which has no existing things (Secondness), compulsion (Secondness), or law (Thirdness): it is a state of pure chance or possibility.

From this state of possibility came accidental 'flashes' ([12.1], 1:412) which, again accidentally, reacted with one another. That is, Secondness emerged. And from these reactions arose a habit-taking tendency or Thirdness. Peirce says that it is the nature of habit ever to strengthen itself and, thus, laws came into being. Evolution is the process of growth; the world becomes more and more rational and law-bound.

This view is connected to Peirce's claims that our ultimate aim or *summum bonum* is the perfection of 'concrete reasonableness' (see [12.1], 5:3). He was fond of saying that ethics is prior to science and that logic is normative. These claims cover a variety of theses, most of which are compatible with the work on logic canvassed above. For instance, sometimes he means the following: 'Logic is a normative science; that is to say, it is a science of what is requisite in order to attain a certain aim' ([12.3], 432:1)—the aim of getting doubt-resistant beliefs. And sometimes he means that logic is critical and involves self-controlled thought, just as morals involves self-controlled conduct (see [12.3], 453). But sometimes, especially towards the end of his life, he means that logic must rest on an inquiry into the ultimate good. It seems to him 'that the logician ought to recognize what our ultimate aim is. It would seem to be the business of the moralist to find this out, and that the logician has to accept the teaching of ethics in this regard' ([12.1], 1:611).

As commentators have long noted, the attempt to base logic on an ultimate aim of something like perfect rationality seems to be in contradiction to the bulk of his work on logic. That work attempts to offer a naturalistic, non-psychological account of logic. Logic, on that naturalistic view, is intimately tied to the scientific method and to getting beliefs which would not be overturned by recalcitrant experience.

Another of Peirce's metaphysical doctrines is 'Synechism', which has it that the notion of continuity is the key to philosophy. Sometimes he says that 'Synechism is not an ultimate and absolute metaphysical doctrine; it is a regulative principle of logic prescribing what sort of hypothesis is fit to be entertained and examined' ([12.1, 6:173). But at other times he presents it as highly metaphysical.

Like Aristotle, Peirce holds that a continuous series is not a collection of discrete points. A continuous series is rather a possibility of endless further determination. A continuum has no existing parts but only a potential for being divided into parts. The infinite number of points on a continuous line are really places at which a point could be located, they are merely possibles or Firsts rather than actuals or Seconds. Continuity itself is an instance of Thirdness; it is a kind of ultimate mediation. For a continuous series is a path where we can always find one thing between two others. Peirce characteristically tries to link up this example of Thirdness with others, most particularly laws and generality.

Another metaphysical debate which Peirce joined is the debate about reality. Sometimes he writes of reality not in the way described above, where reality is the object of perfectly stable beliefs. Instead, he places his view of reality within the idealism-materialism debate and sides for a kind of idealism. Reality, he says, is nothing but 'effete mind'—'what we call matter is not completely dead, but is merely mind hidebound with habits' ([12.1], 6:158). It is unclear whether this idealism can be reconciled with the view of reality elucidated within Peirce's account of truth. And it is unclear whether idealism, along with the other metaphysical doctrines touched upon here, can pass the pragmatic test, which requires metaphysical theories to have consequences for practice.[4]

INFLUENCE

The pragmatic theory of truth is very popular these days. Some of the current brands are not the one Peirce himself offered but closer to those of William James and John Dewey, both of whom acknowledged their debt to Peirce. (In the 1900s Peirce renamed his doctrine 'pragmaticism' to distinguish it from the positions of James, Schiller, etc. He thought that this new name was 'ugly enough to be safe from kidnappers' ([12.1], 5:414).)

Richard Rorty's pragmatism, for instance, while having affinities with Peirce's, has it that the notion of truth is metaphysical and ought to be abandoned. Peirce, on the other hand, thinks that truth is not only a sensible notion, but, given that it is what inquirers aim for, it is essential for inquiry. W.V.O.Quine (in some moods), Hilary Putnam and Jürgen Habermas are more clearly the inheritors of Peircean pragmatism.

Another area where Peirce's influence is still felt is in the field of semiotics, where many of his distinctions, classifications and terminology still reign. He had influence in the field of logic, but he was a Boolean and that school was eventually edged out of the mainstream by the Fregeans. Schröder adopted Peirce's notation, and some well known results are written in it.[5] And Whitehead seems to have learnt quantification from Peirce. But despite the quantity and quality of his work in formal logic and statistical inference, he is probably best remembered in logic for introducing abductive inference, something which by its very nature cannot be formalized.

Unfortunately, Peirce's lack of success in securing an academic position, his rather abrasive personality and his penchant for cumbersome terminology combined to render his views pretty much inaccessible during his own lifetime. He died penniless and

unappreciated. It has been only recently that his work has found the interest it deserves and the excavation it requires.

NOTES

1 References to Peirce's *Collected Papers*, are by volume and paragraph number; to the new *Chronological Edition* and to *The New Elements of Mathematics*, by volume and page number.

2 Some of the material in this and other sections is taken from my *Truth and the End of Inquiry: A Peircean Account of Truth* [12.11]. It is reproduced here by kind permission of Oxford University Press.

3 The psychological hypothesis, however, seems to be false. My suggestion as to how to resolve the difficulty is that Peirce is best read as holding that being responsive to evidence is one of the 'essentials of belief, without which it would not be belief' ([12.3], 673:11). Thus, the aim of inquiry is to get beliefs which are not merely fixed, but which are fixed in such a way that they fit with and respond to the evidence. See [12.11].

4 Peirce did argue against some kinds of idealism on pragmatic grounds: 'Very well; an idealist…is lounging down Regent Street…when some drunken fellow unexpectedly…lets fly his fist and knocks him in the eye. What has become of his philosophical reflections now?' ([12.1], 5:539).

CHAPTER 13
American pragmatism

James

J.E.Tiles

THE BERKELEY LECTURE

Pragmatism was introduced to society in a lecture given by William James[1] to the Philosophical Union at the University of California in Berkeley on 26 August 1898.[2] In his lecture James acknowledged that this brainchild was that of his friend Charles S.Peirce, and that Peirce had first introduced him to it in the early 1870s ([13.11], 410). The child had not been appropriately christened—James indicated a preference for 'practicalism'—and needed 'to be expressed more broadly than Mr. Peirce expresse[d] it', but it offered 'the clue or compass' by which James believed 'we may keep our feet' on 'the trail of truth' (412).

James began his exposition of the principle with a formulation drawn from an 1878 article, 'How To Make Our Ideas Clear' ([13.36], 5:388–410) in which Peirce had first allowed his progeny to appear in public, although not under the name 'pragmatism'. To attain clearness in our thoughts about some object we need to consider the effects of 'a conceivably practical kind which the object may involve' and reckon our conception of these effects to be the whole of our conception of the object, 'so far as that conception has positive significance at all' ([13.11], 411). Peirce had formulated his principle with a view to its application in science and in the metaphysics of science and had consequently illustrated its application with the concepts 'hardness,' 'weight', 'force' and 'reality' in his 1878 article. But he had not hesitated to apply the principle also to the theological dispute over transubstantiation ([13.36], 5:401).

In the Berkeley lecture James drew his illustrations mainly from philosophical theology. Some of the traditional attributes of God—aseity, simplicity, felicity—could be judged by Peirce's principle to be 'meaningless and verbal' ([13.11], 425). 'What the word "God" means is just those passive and active experiences of your life' (428). Compare this to Peirce: 'The idea which the word 'force' excites in our minds has no other function than to affect our actions, and these actions can have no reference to force otherwise than through its effects' ([13.36], 5:405). And as Peirce had insisted that the dispute over transubstantiation was empty unless it could be referred to a difference in sensible effects, James urged that such disputes as that between monists and pluralists were barren unless definite practical consequences turned on the outcome.

Although James suggested that the principle needed to be 'expressed more broadly' it is not easy to see from his lecture alone how, or how far, he thought it necessary to deviate from Peirce's understanding of the principle. He offered as his preferred

formulation, ‘the effective meaning of any philosophic proposition can always be brought down to some particular consequence, in our future practical experience, whether active or passive’ ([13.11], 412). The important point is not that he shifted the formulation from concepts to propositions—he was not grinding the axe which Frege, Russell and Wittgenstein were about to add to the logician’s tool kit—the stress, rather, was to be placed on the word ‘particular’.

Peirce had formulated his doctrine in the context of a conception of practice as a complex of habits, that is as *general* patterns of responding to experience. James cited Peirce’s doctrine that the function of thinking is to produce habits of action (411), but where for Peirce ‘what a thing means is simply what habits it involves’, for James the meaning of a proposition had its bearing on conduct through foretelling some particular turn in our experience. Differences in ‘sensible effects’ were differences in sensory experiences rather than (as for Peirce) differences in habits of response to sensory experience (see [13.36], 5:494). James glossed his preferred formulation with the words, ‘the point lying rather in the fact that the experience must be particular, than in the fact that it must be active’ ([13.11], 412). He thereby departed in a significant way from Peirce, who rejected as a candidate for meaning ‘any unity among our sensations which has no reference to how we act’. For, having tied meaning to habits, Peirce tied the identity of a habit to ‘how it might lead us to act, not merely under such circumstances as are likely to arise, but under such as might possibly occur, no matter how improbable they may be’ ([13.36] 5:400).

How this difference affected the way the two men applied the pragmatist principle can be seen in their respective treatments of the concept of God. Apart from reservations about the wording, Peirce would have endorsed James’s claim that, ‘the principle of practicalism says that the very meaning of the conception of God lies in those differences which must be made in our experience if the conception be true’ ([13.11], 424). James indicated the sort of thing he meant here by ‘differences in our experience’: ‘conversations with the unseen, voices and visions, responses to prayer, changes of heart, deliverances from fear, inflowings of help, assurances of support, whenever certain persons set their own internal attitude in certain appropriate ways’ (428). When in 1908 Peirce offered what he called ‘A Neglected Argument for the Reality of God’ he made it clear that his understanding of ‘experience’ placed far more stress on what a believer was prepared to do than on what happens to a believer: ‘to be deliberately and thoroughly prepared to shape one’s conduct into conformity with a proposition is neither more nor less than the state of mind called Believing that proposition’ ([13.36], 6:467).

Another sign that James and Peirce were moving in significantly different directions occurred at the end of James’s Berkeley lecture, when he commended Peirce’s principle for expressing the ‘English spirit in philosophy’ and heaped scorn on the ‘ponderous artificialities of Kant’ ([13.11] 436). James concluded by urging that ‘the true line of philosophic progress lies not so much *through* Kant as *round* him to the point where we now stand’ (437).[3] Important elements of Peirce’s philosophy—his doctrine that a thought has meaning only through its connection to subsequent thoughts ([3.36], 2:289) and his stress on habits—had taken shape in (come *‘through’*) a Kantian framework.

In the course of a long review of an edition of the works of Bishop Berkeley published in 1871, Peirce had appealed to what with hindsight may be seen as an early formulation

of his principle. ‘Do things fulfil the same function practically? Then let them be signified by the same word. Do they not? Then let them be distinguished’ ([13.36], 8:33). The main thrust of this article, however, was to trace the character of British philosophy back to Scotus and Occam and to condemn the nominalism of late Scholasticism, which had persisted and flourished in the works of Hobbes, Locke and Berkeley. Peirce continued to define his position partly through his opposition to nominalism, which he conceived to encompass the main currents of British empiricism, although he acknowledged that in the early 1870s his ‘ideas were acquiring an English accent’ ([13.36], 5:13). He could not have been entirely pleased at James’s move to enlist his brainchild in the ranks of ‘the English-speaking philosophers’ ([13.11], 434).

In time Peirce felt constrained to dissociate himself from the movement which was initiated by James’s lecture and its subsequent publication and dissemination. He saw James as ‘pushing the method to such extremes as must tend to give us pause’ ([13.36], 5:3) and claimed that ‘the most prominent parts’ of the doctrine James was presenting were ‘opposed to sound logic’ ([13.36], 6:482). It was not his child but a changeling which his friend was sponsoring and Peirce moved to rename his doctrine ‘pragmaticism’—a name ugly enough, as he put it, to keep it safe from kidnappers ([13.36], 5:414).

MIND AS GOAL-DIRECTED

The philosophic distance between James and Peirce not only reveals how remarkable was the genuine respect and admiration each expressed for the other,[4] it raises the question of what it was they had in common, which made it possible for James to appropriate anything of philosophic significance from his friend. The answer lies in the conception of mind as goal-directed, which James and Peirce accepted in different forms. This placed both men in opposition to the tradition of conceiving the essence of mind as lying in its capacity to represent objects in such a way that the adequacy of the representation is independent of its capacity to direct our action and help us to anticipate consequences.

In his *Principles of Psychology* James took ‘*the pursuance of future ends and the choice of means for their attainment* [to be] *the mark and criterion of the presence of mentality* in a phenomenon’ ([13.1], I:8). Consistent with this criterion, a concept for James was ‘really nothing but a teleological instrument. *This whole function of conceiving, of fixing, and holding fast to meanings, has no significance apart from the fact that the conceiver is a creature with partial purposes and private ends*’ (482). Peirce had advanced his ‘pragmatist’ principle in 1878 in the context of a doctrine that thought was directed to the attainment of belief, where belief was a form of habit. Both men treated thought as teleological—although they differed over the character of its *telos*—and were thus attracted to the notion that meaning should be explained in functional terms within a framework of goals and instruments.

Their differences over the *telos* of thought turned, we have seen, on the question of whether it should be conceived as particular (sensory experience) or general (habits of response). There were other differences, more concerned with what should be emphasized, which obscured the nature of the conflict between their different

metaphysical outlooks. Peirce tended to speak from the standpoint of 'the community of those who enquired' and of its long-term direction. James did not reject this standpoint, although it is not easy to say how far he would have agreed with Peirce about its character or importance, for he tended to speak from the standpoint of individuals and their short-term achievements, a tendency which can be observed already in his early work.

He had, for example, published a version of his views of concepts in 1879, where he contended that essential qualities were nothing more than those of most *worth* 'relative to the temporary interests of the conceiver' ([13.1], 86–8), and he quoted at length from this article in his *Principles of Psychology* ([13.1], II:335n.). Peirce would have accepted the contention which James added in his 1890 treatment of essential qualities,

> the only reason why *for the chemist* [water] is H-O-H primarily, and only secondarily the other things, is that *for his purpose of deduction and compendious definition* the H-O-H aspect of it is the more useful one to bear in mind. (334n.)

But Peirce would not have been comfortable with the suggestion that the chemist's interest was merely one of many ephemeral human interests with no claim to special privilege.

Science for Peirce was a historical project which works to eliminate what is limited, arbitrary and accidental in the perspectives of individuals, and what is partial in the interests, which drive them to inquire ([13.36], 8:12). The definition given by chemists is not to be accepted as expressing *the* essence of water, since this definition may require improvement, but it has an authority over definitions which select other properties of water in that it has arisen out of a context of inquiry in which private ends and partial purposes have become—if not completely, at least *more*—public and impartial. James would not have disputed this, but he said little that highlighted it and much that tended to obscure it.

THE ANALYSIS OF TRUTH

This difference in emphasis contributed in large measure to the differences the two men had over the treatment of truth. According to James, applying the pragmatist principle to truth results in the question, 'What concrete difference will its [an idea or belief] being true make in any one's actual life?' ([13.12], 97). The answer was that ideas we call 'true' are those which we can 'assimilate, validate, corroborate and verify'. All of these words were interpreted in conformity with the doctrine that ideas and beliefs function as instruments. Where they do not interfere with the use of existing cognitive resources we are free to assimilate them to our existing stock of ideas. Where they serve to guide our thought and action in a manner which is 'progressive, harmonious, satisfactory', they are treated as validated, corroborated or verified (35). '"The true", to put it very briefly, is only the expedient in the way of our thinking, just as "the right is only the expedient in the way of our behaving"' (106). As a consequence truth became a property of an idea or

an opinion, belief or statement on the occasion of our determining the instrumental value of an idea, opinion, etc.

By 1907, when James published this treatment of truth in a book titled *Pragmatism*, 'pragmatism' had become the name of a movement, which was stirring up considerable controversy, and the centre of dispute was the application of the pragmatist principle to the concept of truth. James's vivid and robust advocacy attracted attention, and inspired two stalwart allies—F.C.S.Schiller at Oxford and John Dewey at Columbia—as well as numerous hostile critics. But his failure to express himself with sufficient care and precision, left his cause exposed to apparently easy refutation.

The general problem he faced can be appreciated by exploring the analogy with instruments. Instruments prove useful for certain purposes in specified circumstances, and when these purposes are superseded or circumstances change they are set aside. In calling an idea or belief 'true', however, we seem to be making a claim with some kind of finality about its worth, a claim which is independent of purpose and circumstance.

By appealing to a notion of science as an unending progressive enterprise, Peirce had been able to apply his understanding of the pragmatist principle to the concept of truth in such a way as to finesse this difficulty. Truth, Peirce held, was to be found in 'the opinion which is fated to be ultimately agreed to by all who investigate' ([13.36], 5:407). It is easy enough to recast this formulation to remove the apparent requirement that there be some point in the future where ultimate agreement is reached: to say an idea, belief, etc. is true is to say that no cause for its rejection or substantial modification will arise for as long as investigation might continue. Since reasons for rejecting an idea or belief include the discovery that its worth depends on special circumstances (which can be eliminated from its formulation) or partial purposes (which admit of being enlarged), Peirce's analysis of truth was able at least to address the finality and independence which appear to be implicit in a claim that something is true.

It was, of course, an important part of Peirce's position—his 'fallibilism'—that we would never be in a position to determine whether an idea or belief was true; the most we could ever say would be that so far we have encountered no reason to reject or modify the idea or belief in question. Even before he pushed pragmatism into the limelight, James had characterized this fallibilist outlook as the '*empiricist*' form of dogmatism and contrasted it favourably with 'the *absolutist* way of believing in truth' ([13.3], 12). Absolutists claim to be able not only to attain truth but to know when it has been attained; empiricists claim it is possible for humans to attain truth but not to know infallibly when they have attained it. This meant that in one sense of the word, 'truth' designated an ideal towards which we would have to strive indefinitely, and in *Pragmatism* James explicitly acknowledged that 'truth' did function, as Peirce insisted, as the name of an ideal. 'The 'absolutely' true, meaning what no farther experience will ever alter, is that ideal vanishing-point towards which we imagine that all our temporary truths will some day converge' ([13.12], 106–7). He did not suggest that what we imagine here was a form of delusion or even a pious fancy; he accepted this rather as a satisfactory account of the meaning of 'absolute truth'.

> On the one hand there will stand reality, on the other an account of it which it proves impossible to better or alter. If the impossibility prove permanent, the

> truth of the account will be absolute. Other content of truth than this I can find nowhere.
>
> (120)

But James had little interest in what was not immediate. The second sentence to follow the last but one of the above quotations ([13.12], 106–7) reads, 'Meanwhile we have to live to-day by what truth we can get to-day, and be ready to-morrow to call it falsehood'.

Peirce rejected any suggestion that it might be permissible to speak of truth as mutable ([13.36], 6:485). To be sure we can and do change our minds about what we take to be true. There are, moreover, ideas and beliefs which, prior to certain dates, were not even entertained by human beings, let alone subjected to verification. This does not, Peirce held, justify saying that beliefs or ideas become true or may cease to be true. One can see, nevertheless, why James wanted to stress what happens today and might happen tomorrow: the long term, even on Peirce's account, is not constituted independently of what is done here and now. (Or, if it should turn out that we are thoroughly benighted in respect to some matter, the long-term truth of that matter is still not independent of what is done at particular times in the future.)

It may, however, have been a tactical mistake to apply the word 'true' and its cognates to what we embrace at particular times, even if that brought a special dignity to what James regarded as crucial to the concept of truth. It might have been wiser to adopt the course which Dewey eventually adopted: cease to use 'truth', following James's preferred gloss, as 'a collective name for [the current results of] the verification-process' ([13.12], 104)[5] and instead allow that 'whatever we will not find reason to correct, so long as we go on enquiring' is an adequate account of what we mean by 'truth'.

James may not have been open to such counsel. He preferred at crucial points to place severe strains on the ordinary meanings of words in order to secure the attention of his audience, even at the risk of being misunderstood. The interpolation made in the quotation in the previous paragraph points to a further example of this. The official statement of James's doctrine held that the truth of an idea (belief, etc.) is 'the process… of its verifying itself ([13.12], 97). This is not the way the word 'truth' is commonly used. Events in which ideas, beliefs, etc. are validated by experience are known collectively as 'verification'; 'truth' is applied as a collective noun for whatever can successfully undergo verification. Within a few pages James acknowledged the strain his definition was placing on our habits of usage. We allow to pass as true a great many ideas and beliefs ('the overwhelmingly large number of truths we live by' (99)) which we do not even attempt to verify. These are not 'abortive' truths; indirect verification—evidence that other people expect experience to bear out the utility of these beliefs—allows us to count them as truths. 'Truth lives, in fact, for the most part on a credit system', although 'beliefs verified concretely by *somebody*' are what preserves this cognitive economy from collapse

A few pages further James appropriated the scholastic distinction between habit and act and acknowledged that to be worthy to be counted a 'truth', a belief does not have to be actually *(in actu)* guiding our practice, just as a person does not have to be lifting weights to be reckoned strong. 'All such qualities sink to the status of 'habits' between their times of exercise; and similarly truth becomes a habit of certain of our ideas and beliefs in their

intervals of rest from their verifying activities' (106). So why define truth as a process if, within James's pragmatism, truth can have a sense in which it applies not to the process of verification but to what is able to withstand the process? What James appears to be doing with his definition is drawing attention to what he believed to be crucial, just as his frequent use of financial metaphors ('cash basis', 'cash value') called attention to the same need of a practical foundation for our cognitive practices. But calling truth a process made it easier for opponents to suggest that the doctrine was riddled with confusion, just as financial metaphors and words like 'expedient' allowed opponents to insinuate that behind James's doctrine were crass commercial values.[6]

ANTI-REALISM

Although expressing the doctrine of truth with more care might have enabled James to go some distance toward placating Peirce, it is not clear that this would have resolved all of their differences over the concept of truth. There remains James's fondness for the claim that 'Truth is *made*' ([13.12], 104) as opposed to 'discovered' and the evidence that not all of what he meant by this is contained in the claim that truth arises out of the process of verification (and re-verification). Part of this claim appears to have been intended by James to reflect the degrees of freedom which we have in fashioning representations able to function cognitively as instruments. What truths we embrace here and now (and hence in the long run) depend on how we carve out and carve up the objects of our experience in order to fashion representations. And how we do that is a function of our purposes (121, 206).

Having come to his philosophy *through* Kant, Peirce would not have found alien the idea that objects, and our classifications of them, are in important respects the products of our cognitive activity. But this raises the question whether (within whatever constraints might be imposed by our cognitive constitution) we can adopt different systems of representation, systems which would if adopted lead subsequent enquiry in such different directions that we could not plausibly regard them as taking us to the same 'final opinion', the same 'truth'. This is one way to read the implications of James's doctrines that our means of representation are instruments serving concrete purposes and that truth is made. This implication, however, requires that it makes sense to suppose that we are free at one or another stage in our history to adopt one set of purposes, to which one set of cognitive instruments would be well adapted, and eschew another set of purposes, to which a different set of cognitive instruments would be better suited. If the thought of making such a choice is coherent, we would not be able to say that the beliefs framed in one system were more true than those of the other because beliefs in each system would be established as true through serving a different set of purposes.

The issue in other words is how much freedom does a pragmatist doctrine of truth leave us? It needs to be emphasized that no pragmatist suggested that our freedom is in any sense absolute. We are constrained in what we do by what our environment will permit us to do—by what means it affords for realizing our goals. We do not even have absolute mastery over the most immaterial of our cognitive instruments, 'We can no more play fast and loose with these abstract relations than we can do so with our sense-

experience. They coerce us; we must treat them consistently, whether or not we like the results' (101). But it remains possible to ask whether it would make sense to say that long-term truth might not be uniquely determined, because at crucial stages we might make choices that would lead to one long-term truth rather another. Did James allow this when he said 'absolute truth will have to be made…incidental to the growth of a mass of verification-experience' (107)?

There seems little doubt that Peirce assumed there would be what is now called 'convergence' if scientific enquiry were indefinitely prolonged. Phrased to avoid the implication that there will be a time when scientific enquiry is complete, this means that should there emerge two or more ways of treating a phenomenon scientifically, the task of reconciling and integrating these theories will not remain impossible indefinitely. Does Peirce's assumption that enquiry will converge amount to anything more than an article of faith?

For one important alliance of anti-pragmatists, Peirce's assumption needs no defence. According to the opponents whom James addresses as 'rationalists' (as well as most philosophers who nowadays profess to be 'realists') representations of the world can be advanced independently of, indeed *'have nothing to do with[,] our practical interests or personal reasons'* (109). There has to be convergence amongst the descriptions offered by all who seek an adequate representation of *the* world; two representations could not fail to be reconciled unless there were two different worlds. Truth resides in the one ideal representation regardless of whether anyone will ever ascertain it. For James, 'There never was a more exquisite example of an idea abstracted from the concretes of experience and then used to oppose and negate what it was abstracted from' (109). But having tied truth to 'practical interests or personal reasons' did James have any grounds for the expectation that our 'verification-experience' will converge?

Although James did not address this specific question, his instrumentalism does appear to have definite anti-realist implications. His admonition against thinking that reality is 'literally' made of ether, atoms or electrons (103) does not appear to reflect mere caution regarding the ultimate utility of theories phrased in these terms. He claimed that 'The term "energy" doesn't even pretend to stand for anything "objective". It is only a way of measuring the surface of phenomena so as to string their changes on a simple formula' (103). Peirce's response to this is likely to have been that if the concept of energy continues adequately to guide our interactions with what James here calls 'the surface of phenomena' there is no point in denying that the term stands for something objective. Any object represented in an opinion which continues to be accepted by all who investigate is by Peirce's criterion real and objective.

James accepted that in choosing our 'man-made formulas we cannot be capricious with impunity' (104), but, consistent with his sympathy for nominalism, he suggested there was a certain latitude in our choice. This expectation may well have been linked to the way he wanted to tie truth not only to 'practical interests' but also to 'personal reasons'. Dewey viewed this appeal to the personal with some suspicion. He was content if it was to be analysed and defined in biological and ethical (social) terms, but not if it were (as in the humanism of F.C. S.Schiller) treated as 'ultimate and unanalyzable, the metaphysically real', in order to underwrite a 'pluralistic, voluntaristic idealism' ([13.18], 325–6).

Peirce for his part would have accepted the link to practical interests; these were written into the pragmatist principle. Those who enquire are looking for practical guidance for establishing stable habits of action, and realists and rationalists are mistaken in offering an account of truth which pretends otherwise. Peirce, however, would not have included 'personal reasons' alongside 'practical interests'; these generate the limitations and partialities which scientific enquiry is supposed to eliminate from our representations. The purpose of science includes transcending the personal at least in the sense linked to individualism.[7] If convergence involved an article of faith for Peirce, what rested on faith was the belief that it is possible for humans to transcend the personal in this sense. It was not a matter of faith that science should converge; if our enquiries do not converge it will be because we have not conducted our enquiries in the right spirit.

THE RIGHT TO BELIEVE

That one might rest science on faith of this sort—on a set of beliefs regarding the possibility and supreme worth of working towards a common goal, which is specified only schematically—was endorsed by James even before he publicly adopted Peirce's principle as his protégé. In the title essay (first published in 1896) of a collection, *The Will to Believe,* dedicated 'to my old friend Charles Sanders Peirce', James had defended the right[8] to believe in facts where belief might well be something needed to help create the fact ([13.3], 25). The actuality of pragmatism's truth is indeed dependent in this way on the beliefs of those who enquire and the cognitive posture, which pragmatists thus require of scientists, would be scorned by those—James cites (T.H.) Huxley and (W.K.) Clifford—who insist we must not 'believe anything upon insufficient evidence' (7–8). James was not at this point advancing the doctrine that truth is made—'in our dealings with objective nature we obviously are recorders, not makers, of truth' (20)—but he insisted on the status of truth as an object of common endeavour, 'Our belief in truth itself…that there is a truth, and that our minds and it are made for each other,—what is it but a passionate affirmation of desire, in which our social system backs us up?' (9). To insist that we as individuals have sufficient grounds for believing in the attainability of truth, before taking steps to attain it, could well, James argued, stand in the way of our attaining it (24–5).

Thus the issue James took with Huxley and Clifford was over their suggestion that a belief system could be based entirely on intellec-tual grounds without resting at any point on commitment or, as James put it, on our 'passional tendencies and volitions' (11). Not only does 'our passional nature' influence our beliefs, there are cases in which this influence 'must be regarded both as inevitable and as a lawful determinant of our choice' (19). What Huxley and Clifford were doing, James insinuated, was foisting on others the predilections of their own particular 'passional natures' under the pretence of having put all emotional involvement aside.

'The Will to Believe' although pre-pragmatic in some respects was read as a document of the movement.[9] Thus its attack on Clifford contributed to the accusation that pragmatism encouraged people to believe whatever would prove convenient or would lead to success measured in terms of personal satisfaction. For James had quoted Clifford

as claiming, ‘Belief is desecrated when given to unproved and unquestioned statements for the solace and private pleasure of the believer’ (8). And in *Pragmatism* James said a number of things, which taken on their own might also be interpreted as embracing precisely what Clifford condemned.

In the final chapter James declared that ‘On pragmatistic principles, if the hypothesis of God works satisfactorily in the widest sense of the word, it is true’ ([13.12], 143). Earlier he had quoted from a Christian Science leaflet and said of it, ‘beyond doubt such a confession of faith has pragmatically an emotional value’ (74). A page later the mystical teachings of Swami Vivekananda were said to be ‘a religion which, emotionally considered, has a high pragmatic value’. Clearly ‘works satisfactorily in the widest sense’ was meant to *include* ‘generates emotional security’ but if James’s audience failed to bring to bear other things which James had said about the constraints operating on belief (to be discussed here shortly) they were likely to carry away the impression that the solace or personal satisfaction offered by a belief were meant to be a sufficient touchstone of its truth.

If James had taken steps to forestall this impression, he might have stressed that the primary consequences by which a belief or idea was to be tested were those bound up in what Dewey referred to as the ‘intent of the idea’. What Dewey meant to convey by this phrase was that included in the conventions which determine the commonly accepted meaning of an idea or belief are quite specific conditions for the correct application of the words which are used to convey it. Dewey thereby implied a criticism of James for his illustrative example argued that the fatal consequences of drinking a liquid to test the idea that it is a poison are very good indicators that the idea is true, and it is these consequences which are relevant to the question of its truth, not the bad consequences of a painful death ([13.18], 320). By impli-cation the emotional consequences of believing something were not to be treated as relevant to its truth.

James might well have replied that beliefs function in multiple ways and, while accepting that he should not neglect the ‘intent of an idea’, he clearly would have resisted excluding the functions of solace and satisfaction in deciding how well they work. The account, which he gave in his Berkeley lecture ([13.11], 415–24) and reproduced verbatim in *Pragmatism* ([13.12], 51–6), of the pragmatic difference between materialism and belief in God, rested entirely on the reassurance which could be derived from the way the notion of God ‘guarantees an ideal order that shall be permanently preserved… This need of an eternal moral order is one of the deepest needs of our breast’, because it sustained hope where the ‘materialist’ outlook meant ‘the cutting off of ultimate hopes’ ([13.12], 55). These needs were not universal but present in ‘superior minds’, while their absence was a sign of ‘the more shallow man’ (56).

This account of the pragmatic meaning of belief in ‘God’ was said by James to have been deliberately phrased in terms of future consequences. He argued that if the universe had no future, if this were its absolutely last moment, it might well be that the ‘materialist’ and the ‘spiritualist’ hypotheses were equivalent and there be nothing, pragmatically speaking, in the choice between them ([13.11], 414; [13.12], 50). But in referring to future consequences James clearly had in mind our attitudes towards the indefinite future long after any of our actions (perhaps the actions of any human beings) have determinable practical consequences. In response Dewey claimed that this account

of the meaning of 'God' involved a considerable departure from what would appear to be sanctioned by Peirce's principle. If consistently applied, Peirce's principle would 'simply abolish the meaning of an antecedent power which will perpetuate eternally some existence' ([13.18], 315). Dewey protested at what he saw as the 'unpragmatic' procedure of determining the (emotional) 'value of a conception whose own inherent significance pragmatism has not first determined' (316).

James, however, read the pragmatist principle as allowing consequences to be spelled out not only in terms of how we act but also in terms of how we feel. This was underscored when later he claimed that almost from the outset he had thought his argument that the spiritualist hypothesis served only to guarantee an ideal order was flawed. This was because, James believed, there would be for people an important difference if they could regard the universe as containing 'a being who will [at every moment does] inwardly recognize them and judge them sympathetically' ([13.12], 269n.). James's retraction here leaves no doubt of the importance of private conscious experience in the system of values by which he intended to judge whether beliefs worked. He reinforced his claim about the need for God's sympathy and recognition of our inner experience by means of a thought experiment involving a soulless robot woman who behaved in a way indistinguishable from 'an animated maiden'. 'Pragmatically…belief in the automatic sweetheart would not *work*', because such a creature would not satisfy a man's craving for 'inward sympathy and recognition, love and admiration' (ibid.) Our consciousness requires recognition (by God) and men require conscious recognition (by women) of their qualities. Beliefs that fail to satisfy these requirements do not work.

But this is not to say that the satisfaction of such needs was sufficient by itself to underwrite the truths of beliefs. James made it abundantly clear in 'The Will to Believe' that he did not think we could adopt just any belief at will, simply because it offered personal satisfaction or solace. For any historically situated individual only certain hypotheses were 'live' and only certain choices between believing and not believing were in addition sufficiently important and unavoidable to be 'genuine' ([13.3], 2–4)

The point about the need for new beliefs to cohere with existing beliefs, on which James placed considerable stress in his account of truth in *Pragmatism*, was already prominent in this article. Here it indicated how historical and cultural factors, along with empirical and logical constraints, circumscribe the proper sphere of will and emotion in determining belief. We cannot pick and choose beliefs to suit our tastes. We cannot, after all, just by willing, believe that we are well when 'roaring with rheumatism' or that the sum of two one-dollar bills in our pocket is a hundred ([13.3], 5). But the logical and empirical constraints which hold us to one or another of certain complexes of belief should not be expected to determine for us precisely one complex worthy of belief.

Other of James's examples illustrate well the cultural and historical factors which close off some options and open others to the will and emotions—which, in other words, make an hypothesis live and genuine for some people, dead or spurious for others. In the late nineteenth century belief in the Mahdi may have been among the mind's possibilities for an Arab, but not for a North American (2). Whatever the force of the argument known as Pascal's wager, the option to heed or ignore its conclusion, 'take holy water, and have masses said', is not alive for someone, e.g. Turk or Protestant Christian, who has no pre-existing tendency to believe in masses and holy water (6).[10]

PLURALISM

The shadow cast in James's discussion, here and in *Pragmatism*, by the notion of belief systems as to a large degree mutually impermeable cultural entities gives his development of pragmatism a flavour which has become very familiar nearly a century later. There appears to be a tendency in James's discussion towards what is now known as 'pluralism' (identified in some quarters with 'postmodernism'), that is resistance to the principle that we should expect one system of beliefs to prove superior to all others. There may be a number of viable systems no one of which can ever be declared superior to the others. (In more radical versions pluralism merges with relativism: no system of belief can ever be declared superior to any other.)

It is this tendency in James which allows some recent writers to enlist pragmatism in the pluralist ranks. Whether this tendency is actually present in James or is merely a superficial appearance, which would evaporate under careful reading, it is clear that it is not pragmatism as such which brings pluralism in its train. Peirce expected applications of the pragmatist principle, including those to the concepts of truth and settled belief, to generate in due course a single authoritative system. He wrote consistently as though there was a single preferred method of stabilizing belief, directed at a single objective, with a single expected outcome. And there is nothing in this which is inconsistent with his pragmatist principle.

Nevertheless it should be acknowledged that fallibilism (which, although not the whole, is an essential part of pragmatism) and the undermining of 'rationalist' or cognitivist conceptions of truth, together 'create a space for pluralism. If, as James put it ([13.3], 13), we cannot rely on anything to click inside us when we grasp the truth and thus should remain open to the possibility that our most strongly held beliefs may need to be revised, who can (ever) claim to be in possession of the one truth?

If, as the opponents of pragmatism insist, truth is a two-term relation of 'agreement' or 'correspondence' which obtains between our representations (whether these be conceived as physical entities or as mental states) and the world, it is difficult to allow that there might be more than one relation of agreement. Once this 'rationalist' conception is set aside and it is accepted that 'agreement' has to rest on the functional role which a representation plays in some active intervention in the world ([13.12], 95–7, 216–17), what constitutes 'agreement' has to be taken as relative to the ends served by the intervention. Whether or not there is one truth (towards which we all can work) then depends on whether there is a single end to some of our interventions—for example those interventions which constitute our scientific enquiries—one that gives a special authority to those representations which serve well the unitary end of those particular endeavours.

In other words pragmatists can acknowledge one truth only if they assume (as Peirce assumed) that there is some one end to which (regardless of whatever other ends we might have) our representations (theories) must serve. It is by no means as easy to specify such an end as it might at first appear. Notions in common use nowadays in analytic philosophy of science, such as 'empirical adequacy', do not sufficiently specify an end. What counts as empirically adequate knowledge in different contexts depends on why

one wants to know.

Although James characterized himself as a ‘pluralist’, it is not clear whether he stood so far from Peirce as to have been prepared to embrace pluralism about truth. The difficulty determining where James stood on this matter arises because the monists, against whom James defined his ‘pluralism’, were not concerned about this sort of question.

James repeatedly took up the issue of ‘the one and the many’ to illustrate the application of the pragmatist principle.[11] His interest in the question arose from a long-running dispute, which he had with his friend and colleague, the idealist philosopher Josiah Royce. The issue was ostensibly whether the universe was one or many, and in applying the pragmatist solvent, which in this case required spelling out the consequences of the world being one ([13.12], 65–6), James first had to distinguish several senses in which the world could be said to be one. Did this mean spatio-temporally unified, causally unified, subsumed under a single genus, and so on? It was clearly not worth while applying the pragmatist principle to all eight of the possible senses identified in *Pragmatism*, but even for the more interesting cases James concentrated less on what difference it made to say ‘one’ or ‘many’ and a good deal more on how we should respond to the issue if we wish to be properly pragmatic about it.

One of the more important issues which James flushed out of the unruly undergrowth disputed by monists and pluralists was ‘Does the world have a unity of purpose?’ Empirically minded pluralists observe different and often conflicting purposes in the world. The most they would concede, James suggested, was that ‘our world is incompletely unified ideologically and is still trying to get its unification better organized’ ([13.12], 70). Idealists sought a unification and reconciliation of this manifold in a single ‘purpose that every detail of the universe subserves’ so that ‘all evil in the universe is but instrumental to its greater perfection’ (70).

Although James accepted this as a legitimate hypothesis, albeit one which it was risky to dogmatize, he clearly viewed the long-suffering and complacent attitudes towards evil, which it encouraged, with profound distaste. His discussion at this point alludes to an earlier chapter where he castigated as ‘a little ghastly…the satisfaction with which a pure but unreal system will fill a rationalist mind’ ([13.12], 18). With a rare display of social concern, James cited personal experiences of oppressed working men, gleaned from a book by a radical (‘anarchistic writer’), Morrison I.Swift, as examples of what his friends Royce and F.H.Bradley (‘and a whole host of guileless thoroughfed thinkers’) treated as conditions of the perfection of the eternal order (21).

But while James could thus ridicule the idea of an already existing unifying purpose to the universe, he did not appear to reject the thought that ‘our world is…still trying to get its unification better organized’. Still less did he reject the idea that human beings should conceive their cognitive efforts as contributing towards a single goal, and suggest instead that they might expect it to fragment into multiple irreconcilable goals. Although in general James resisted antecedently existing unities, he was prepared to tolerate such unities as ends towards which things might move: ‘If such an hypothesis were legitimate, total oneness would appear at the end of things rather than at their origin. In other words the notion of the “Absolute” would have to be replaced by that of the “Ultimate”’ ([13.12], 78). This statement implies a far greater tolerance of Peirce’s

conception of truth as the end of enquiry than is harboured by more recent pluralists.

James's response to another of the issues covered by the 'monism/ pluralism' blanket is also instructive in this connection. Idealist philosophers not only claimed that the Absolute secured for the world a ideological unity, they also claimed that it provided the world with 'an *all-enveloping noetic unity*' (71). In response to this 'hypothesis' James recalled how he had already credited the omniscience of God with the pragmatic value of sustaining conceptually (for the satisfaction of our emotional needs) an eternal moral order. This monist hypothesis was otherwise on a par with that of the pluralist, according to whom 'there is no point of view, no focus of information extant, from which the entire content of the universe is visible at once' (72).

James was clearly prepared to recognize cognitive value (the grasp of some truths) in viewpoints which did not comprehend the whole. Idealists by contrast commonly argued that to grasp the truth of anything one had to appreciate its interrelations to every other truth, and hence truth was accessible only to an infinite all-comprehending intellect. James reckoned it possible for '[e]verything to get known by *some* knower…but the knowers in the end be irreducibly many, and the greatest knower of them all may yet not know the whole of everything' (72). In this picture-puzzle universe known only through a multitude of overlapping pieces, there is room for the possibility that the pieces might not go together to make one big picture but instead conflict irreconcilably so that the totality would have to be treated as several pictures of distinct realities. And this possibility remains delicately counter-balancing the possibility of an ultimate truth.

PRAGMATIST REALITY

It may well be that this balancing act was the only stable position for James to adopt given what he said about the extent to which truth is made and what he took to be the implications of this for the concept of reality. James expressed the opinion ([13.12], 117) that his British ally, F.C.S.Schiller, had, in advancing 'humanism' (which was Schiller's preferred label for his own philosophic position), pressed to misleading extremes the claim that truth is made. In 'making' our truths, James emphasized, we have to take account of reality in three different aspects. Sensations are forced upon us; certain relations between our sensations (some of them fixed and essential) are facts; and we are also constrained by what we have previously taken as truths (117–18). Within these constraints we still have a certain amount of freedom, for example to attend to some sensations and ignore others, and may 'read the same facts differently' depending on our interests (118).

James happily embraced the doctrine that there is always a human contribution to human knowledge, that is to say our representations of reality will always reflect our interests and limitations—and that representing reality in a way wholly independent of human thinking is at best an 'ideal limit of our minds' (119). If 'humanism' labelled the doctrine that our beliefs about reality will always contain human elements, James was prepared to recognize it as part of pragmatism. We encounter fresh experience with a set of beliefs which determine what we notice. What we notice determines what we do and this in turn determines what we experience. So 'altho the stubborn fact remains that there

is a sensible flux, what is true of it seems from first to last to be largely a matter of our own creation' (122). And if we add to this the thought that our actions and descriptions are themselves additions to reality (123), we will come to see ourselves as qualitative growth points in reality itself.

James's rationalist opponents were, as he saw them, committed to a reality *'ready-made and complete from all eternity'*. Reality for a pragmatist on the other hand is *'still in the making'* awaiting *'part of its complexion from the future'* (123). Pragmatists held there was one edition of the universe, unfinished but growing 'especially in places where thinking beings are at work', while the rationalists held out for a universe in many editions, 'one real one, the infinite folio, or *édition de luxe*, eternally complete' and many finite, distorted error-ridden editions (124). Although the image of one edition as opposed to many pointed numerically in the wrong direction, James saw this as another version of the opposition between the monist (rationalist, many edition) outlook and the pluralist (pragmatist, single edition) outlook. But even here the apparent commitment to unity suggested by the image of a single (growing) pragmatist edition was balanced within a page by an expression of agnosticism: 'For pluralistic pragmatism, truth grows up inside of all the finite experiences. They lean on each other, but the whole of them, *if such a whole there be*, leans on nothing' (125, emphasis added).

James contended (124) that this issue was not entirely a question of the theory of knowledge. The issue indeed turns in part on how we locate human experience and cognition within reality. If these phenomena—together with the events, the outcomes of which depend on the fact that humans think one way rather than another—are treated without qualification as natural events, it is difficult to resist the claim that reality itself is characterized by growth. In practice epistemology is commonly undertaken with one or both of two fundamental Cartesian presuppositions in place, presuppositions which are seldom made consciously or explicitly. Firstly, human experience and cognition, which shape human representations of reality, are treated as transparent, unaffected by history or culture. Secondly, human thinking is treated as something which occurs outside (beyond, at the margin of) natural events. It is because our thought processes are thus on the one hand not part of nature and on the other known introspectively so that those which are clear and distinct may be taken as transparently true, that human thinking is not regarded as a part of what humans aspire to know. It is hardly surprising in the light of these presuppositions that James's contention that our ways of representing reality always reflect our interests and particular perspectives met with hostility and his contention that our efforts to represent the world are themselves developments of the world met with incomprehension.[12]

When disputes touch these presuppositions (as in debates between pragmatists and 'new realists' shortly after James's death as well as in more recent literature),[13] it is claimed that objectivity in knowledge requires us to suspend all our special (i.e. practical) interests just as objectivity requires us to suspend all personal involvement in judging legal and ethical questions. The notion of objective knowledge, moreover, precludes us from claiming knowledge of anything which our own activity affects (interferes with). In aspiring to know, we aspire to represent things as they are in themselves independently of us. The idea that our own activities (let alone the perspectives shaped by our interests) contribute in important ways to the objects which we aspire to know counts as scientific

heresy. The humanist claim about the inevitable human influence on our representations and the pragmatist claim about the inevitable influence of our actions on the objects we aspire to know completely undermine, it is argued, objectivity as we understand it.

The Cartesian presuppositions also appear clothed as a preference for logic over psychology. When Bertrand Russell criticized James, he observed how 'Most philosophies are determined by their initial questions and by the facts which habitually fill the imagination of the philosopher' ([13.28], 104). Pragmatists, he contended, were preoccupied with 'psychical facts'. Where the scientifically minded think of the facts and the theologically minded think of God, pragmatists worry about scientific *theories* and about *belief in* God—signs in Russell's view that what filled the imaginations of pragmatists were 'psychological' phenomena (104). This led pragmatists, Russell contended, to confuse what *is* true with what is *thought to be* true (111). It is the former question which, he insisted, should be addressed.

Characterizing one's opponents as preoccupied with psychology came to be a familiar pattern of criticism in the early decades of this century. There were no doubt serious errors which deserved the stigma that was attached by means of the label 'psychologism'. But the stigma also served to silence or marginalize those who, like James, wished to treat human experience as a part of nature. It in effect placed their concerns on the mental side of the familiar body-mind dualism. Interests, satisfactions and perspectives could all be treated as belonging to the way the world appears to subjects, to features of their mental representations of things. Interests, satisfactions and above all the limitations of historically situated perspectives did not consequently need to be located in the natural (physical, material) world. Logic could (and did in the early decades of the twentieth century) divorce itself from all these psychological conditions—as well as eventually from judgement, belief and even inference—and concentrate on how truth could be distributed over the structure of representations, a structure conceived of as abstracted entirely from human thought processes.

To sustain the pursuit of the question 'what is true?' without becoming entangled in the question 'what is thought to be true?' Russell had to insist not only that (as Peirce had insisted) science could pursue a unitary goal of truth but that it could rest its findings on a body of indisputable truths, in respect to which a fallibilist outlook would be unnecessary and inappropriate. Russell clearly operated with a conception of science as seeking a kind of satisfaction—'theoretic satisfaction' (108)—which was quite independent of any other kind of utility which might be derived from holding a belief. To achieve this satisfaction, he held, the empirical ('inductive') sciences tried to make all their statements agree as far as possible with observed facts.

The 'old inductive philosophy, as exemplified in Mill's logic' presupposed 'that there are truths of fact prior to the whole inductive procedure' (104–5). In the empiricist tradition, which Russell represented, the most secure of these truths of fact were given in sense experience. But, as Russell appreciated, James had sought to loosen the tie between truth and facts. Facts are indeed given to us in sense experience, but they are not truths; truths are what we say about facts (106) and, as noted above, James allows there to be latitude in how we respond to what is given in experience. Russell insisted that the meaning of 'truth' (what can be expected to be in the mind of a person employing the word 'truth', [13.28], 109–10) was tied to facts in the same way as the 'theoretic

satisfaction' sought in science. Pragmatists would in the end, therefore, be forced to recognize cases of 'plain matters of fact' about which there would simply be no doubt (134) and hence presumably no latitude in how we should respond to them.

Pragmatism, however, had begun as a principle for achieving clarity about what we can possibly mean by terms such as 'true' and 'truth'. It recognized no obligation to remain faithful to what ordinary people meant by such terms. Pragmatists could moreover question the soundness of Russell's inference that our ordinary conception of truth would underwrite a class of statements as representing 'plain matters of fact'. To arrive at such a class Russell had to select statements whose implications were severely restricted. Russell's candidates (bare reports of sense data) may well have seemed unquestionably authoritative, but only at the price of being uncommonly powerless to guide our practical affairs. Russell, of course, had professed more interest in what could be regarded as a matter of fact than in what might offer practical guidance, but ordinary people are as much interested in the latter as in the former. If Russell's path to determinate matters of fact led away from anything of practical consequence, it is not clear that ordinary usage would be prepared to follow Russell.

One might apply the pragmatist principle in the fashion of James and inquire what broader consequences turned on the specific dispute between James and Russell over whether certain of 'the facts' of experience could or should be represented as uniquely authoritative 'truths'. Russell's doctrine had the effect of securing, at the crucial point where experience impinges on our minds, a cognitive relationship to reality in which the mind has no alternative but to reflect passively what is given to it. The logical structure of our thought can then be relied upon to determine how the mind must conform if it is to possess a true, more comprehensive representation of reality. Russell thereby indicates the logical-empiricist route to the ready-made reality which James had opposed in the rationalist (idealist) philosophies popular in his day.

By stressing that there are degrees of freedom even at the experiential interface between human minds and the world in which they are situated, James encouraged a picture of the mind as functioning actively rather than passively. He also stood as an obstacle to the total dominance of the conception of reality as something which imposes on us, requiring conformity from our minds and leaving no room for development in which we might play an essential part. Long before he became associated with pragmatism James had rejected any outlook which entailed determinism and denied human beings the capacity to act freely.[14] The libertarian or voluntaristic position which James favoured may not have followed strictly from pragmatic principles, but pragmatism, even when conceived narrowly as a method for gaining clarity through spelling out practical consequences, rests on a conception of human beings as active and of their cognitive activities as making a difference to the world, rather than merely reflecting the way it is.

THE FORTUNES OF PRAGMATISM

James's reply to Russell ([13.12], 312–19) concentrated on rebutting what James took to be perverse misinterpretations of his position found elsewhere. He did not engage Russell

directly over the issue of whether statements we choose to make about sensory experience could or should be treated as ‘plain matters of fact’. He did remark on what he saw as the excessive ‘abstractionism’ in Russell’s procedure. These, as it transpired, were the two most prominent features of the philosophy, logical empiricism, which during the 1930s came to eclipse pragmatism. It was accepted (widely, but not universally) that the possibility of empirical knowledge rested on sensory experience, which provided us with a class of statements which expressed ‘plain matters of fact’. These were commonly taken to be observation statements reporting particular experiences, and more general statements (including scientific theories) which did not express plain matters of fact had to answer to such ‘truths’. They did so through a structure represented abstractly in the new (mathematical) logic, which Russell had helped to shape, and which held out the promise of a sharp distinction between the empirical content of statements (where they rest on indisputable fact) and the conventions governing the uses of words.

In 1951 W.V.O.Quine challenged ‘two dogmas of empiricism’: one the belief that we can sharply distinguish between synthetic statements, those with determinate empirical content, and analytic statements, those true in virtue of the conventions governing language; and the other the belief that the empirical content of statements could be reduced to (represented entirely in terms of) the observation state-ments which they entailed. During the reign of these dogmas, pragmatism, although it had able supporters, was avoided by anyone who did not wish to appear out of fashion. Once the hold of the two dogmas had been broken, it became possible to speak without pejorative overtones of the work of Quine and Donald Davidson as continuations of the pragmatist tradition[15] and possible to proclaim a revival of that tradition. But the pragmatism of Peirce, James and Dewey consisted in more than the denial of Quine’s two dogmas. It is far from clear yet whether the current modest fashion for pragmatism will lay sufficient stress on mind as goal-directed, on intellectual clarity as tied to practical outcome, on truth as the long-term product of our enquiries and on human experience as a natural phenomenon, for it to count as a continuation of the tradition rather than a transmogrification into something all its founders would have regarded as quite alien.

NOTES

I am grateful to Ron Bontekoe, John Hodges and Mary Tiles for helping me to eliminate infelicities from the penultimate draft of this chapter.

1 Biographical note: William James was born in New York City in 1842, the eldest child of Mary Walsh and Henry James Sr. His independently wealthy father established a reputation as a man of letters and a somewhat eccentric theologian. The oldest of William’s three brothers was the novelist Henry James, Jr, and his only sister Alice has recently been acclaimed for the diaries which she left. After considering a career as a painter, James took a medical degree at Harvard in 1869 and in 1872 began a teaching career at Harvard which moved from physiology through psychology (1875) to philosophy (1879). He was appointed professor of philosophy in 1885, retired in 1907 and died in 1910. For a chapter-length account of James’s life and career, see [13.25].

2 The lecture, titled ‘Philosophical Conceptions and Practical Results’, appeared as the lead

article in the *University Chronicle* for September 1898 and as a separately published pamphlet circulated by the Philosophical Union and by James himself ([13.19], 285). Within a year James's address had been discussed by Dickinson Miller in the *Philosophical Review* and pragmatism had been the subject of an address (published in *Mind* in October 1900) by William Caldwell at the American Psychological Association ([13.19], 293).

3 It is ironic that critics have detected distinctively Kantian elements in James's thought. Kuklick ([13.22], 273–4) finds that James became more Kantian as his thought developed up to his death twelve years after delivering his lecture at Berkeley. Henri Bergson ([13.15], 257) remarked on the Kantianism of James's doctrines in an introduction to a French translation of James's *Pragmatism* published in 1911.

4 See Peirce ([13.36], 6:182–4) for a moving tribute to James.

5 Dewey [13.33] recommended 'warranted assertibility' instead of 'truth'.

6 Dewey ([13.18], 330) expressed frustration with this common misunderstanding. 'No misconception of the instrumental logic has been more persistent than the belief that it makes knowledge merely a means to a practical end, or to the satisfaction of practical needs—practical being taken to signify some quite definite utilities of a material or bread-and-butter type…. I again affirm that the term 'pragmatic' means only the rule of referring all thinking, all reflective considerations, to consequences for final meaning and test. Nothing is said about the nature of the consequences; they may be aesthetic, or moral, or political, or religious in quality—anything you please.'

7 Individualism was for Peirce one of the 'daughters of nominalism' ([13.36], 8:38).

8 James referred to his thesis in terms of 'right' rather than 'will' and in various places expressed regret over his choice of title ([13.12], 124; see note to 124.13 on 164).

9 Russell regarded it as foundation of the pragmatist theory of truth ([13.28], 89–97, 113). Peirce's complaint ([13.36], 5:3) that James had pushed the pragmatic principle to unwelcome extremes mentioned this article together with the Berkeley lecture.

10 James places this latter claim within an objection to Pascal and to the idea of exercising volitional control over our beliefs. He thus did not immediately endorse it, but he did nothing to rebut the claim that, without a pre-existing tendency, masses and holy water will do nothing to 'stupefy [one's] scruples' as Pascal was quoted as saying ([13.3], 6). Later James credited Pascal's argument with being 'a regular *clincher*, and…*the last stroke* needed to make our faith in masses and holy water complete' (11, emphasis added).

11 E.g. in the Berkeley lecture ([13.11, 430ff.), in a chapter of *Pragmatism* ([13.12, 63ff.) and in a chapter of the book *Some Problems of Philosophy*, on which he was at work when he died in 1910 ([13.13], 61ff.).

12 Peirce's earliest published work had begun with a rejection of Cartesianism epistemology and all of those, who subsequently enlisted under the banner of pragmatism, who repudiated Cartesian dualism. For James's doctrine of 'neutral monism', his doctrine of a 'primal stuff' consisting of 'pure experience', see [13.10], chapters 1 and 2.

13 The New Realist manifesto and Dewey's dispute with a representative of the group are reprinted in [13.34]. More recent articulations of the presuppositions are to be found in [13.38], chapter 2 and [13.35], chapters 1, 2, 6 and 8.

14 During the period between receiving his medical degree and beginning his teaching career James suffered from severe depression in which determinism appeared to him a very real threat to his moral interests. His diary for 30 April 1870 records how he was helped over this crisis by reading the French philosopher Charles Renouvier and also records a resolve which sheds light on his doctrine of a will/right to believe, 'My first act of free will shall be to believe in free will' ([13.25, 43).

15 For an example of such a reading of the continuity of the tradition see Murphy, [13.24]. This posthumously published textbook was seen through the press by Richard Rorty, who has been the prime mover behind the respectability which pragmatism has recently re-acquired. See [13.37].

BIBLIOGRAPHY

Major works published by James

13.1 *The Principles of Psychology*, 2 vols, New York: Henry Holt, 1890; reprint New York: Dover, 1950.
13.2 *Psychology (Briefer Course)*, New York: Henry Holt, 1892.
13.3 *The Will to Believe and Other Essays in Popular Philosophy*, New York: Longmans, Green, 1897; reprint with [13.4] New York: Dover, 1956.
13.4 *Human Immortality: Two Supposed Objections to the Doctrine*, Boston: Houghton Mifflin, 1898.
13.5 *The Varieties of Religious Experience: A Study in Human Nature*, New York: Longmans, Green, 1902.
13.6 *Pragmatism: A New Name for some Old Ways of Thinking*, New York: Longmans, Green, 1907; reprint with [13.7] as [13.12].
13.7 *The Meaning of Truth: A Sequel to 'Pragmatism'*, New York: Longmans Green, 1909.
13.8 *A Pluralistic Universe*, New York: Longmans, Green, 1909.

Works by James published posthumously

13.9 *Some Problems of Philosophy*, edited by Horace M.Kallen, New York: Longmans, Green, 1911, reprint as [13.13].
13.10 *Essays in Radical Empiricism*, ed. R.B.Perry, New York: Longmans, Green, 1912.
13.11 *Collected Essays and Reviews*, ed. R.B.Perry, New York: Longmans, Green, 1920.
A complete edition of the works of William James edited by F.Burkhardt, F. Bowers and I.K.Skrupskelis, Cambridge, Mass.: Harvard University Press, includes
13.12 *Pragmatism and the Meaning of Truth*, 1975.
13.13 *Some Problems of Philosophy*, 1979.

CHAPTER 14
Green, Bosanquet and the philosophy of coherence

Gerald F.Gaus

INTRODUCTION

Along with F.H.Bradley (chapter 15), T.H.Green and Bernard Bosanquet were the chief figures in what is commonly called British idealism. Bradley is widely regarded as the most eminent philosopher of the three; his *Ethical Studies*, published in 1876, was the first in-depth presentation of idealist ethics, including an account of the individual's relation to society (Nicholson, [14.45], 6). But after this initial work, Bradley had little more to say about ethics;[1] the development of the moral, and especially the political, philosophy of British idealism was carried on by Green and his followers, particularly Bosanquet.

Though he published little in his lifetime, Green (1836–82) had enormous influence through his teaching at Oxford. Green was appointed tutor in philosophy at Balliol in 1866 and in 1878 became White's Professor of Philosophy, a post he held until his death in 1882. Green's influence on his students apparently stemmed as much from his moral earnestness and the religious implications of idealism as from his philosophy, prompting C.D.Broad's jibe that he turned more undergraduates into prigs than Sidgwick ever made into philosophers ([14.20], 144).[2] As was the case with many of the British idealists, Green was a political and social reformer, being especially influential in educational reform (Gordon and White, [14.33]). Both of his major works were published after his death. Parts of his *Prolegomena to Ethics* were in a final form prior to his death; his main contribution to political philosophy was his *Lectures on the Principles of Political Obligation*, edited by R.L.Nettleship.

Green, while sometimes dismissed as a philosopher, is almost always treated nowadays with sympathy; Bosanquet (1840–1923) cuts a much less sympathetic figure. In his many published works, he presented a more systematic—and apparently much harsher and more Hegelian—version of Green's philosophy. Not only was he more obviously Hegelian, but Bosanquet seemed inevitably attracted to statements of his views that were most likely to outrage traditional English liberals, speaking, for example, of 'the confluence of selves' ([14.16], 107) and insisting that the moral person composing society is more real than what we call individual persons ([14.14], 145). Thus, the most famous attack on Bosanquet, L.T.Hobhouse's *Metaphysical Theory of the State*, charges that Bosanquet's theory is deeply illiberal: it is unable to account for the 'irreducible' separateness of selves and ultimately endorses a sort of State worship ([14.37], 62; Freeden, [14.29], 35). Yet Hobhouse absolves Green from his most serious charges;

indeed, Hobhouse claimed that his own theory was the true successor to Green's ([14.38], chapters 7–8; [14.39], chapters 5–6). Whereas Hobhouse can be called a 'Left Greenian', arguing in support of something like a welfare state, Bosanquet can be understood as a 'right Greenian' (Collini, [14.24], 107–8). Bosanquet spent very little of his life inside academia, the most important exception being his tenure as professor of philosophy at St Andrews University from 1903 to 1908. Most of his life was devoted to the Charity Organization Society (COS), which objected to State provision of welfare such as outdoor relief to the poor. Bosanquet and the COS insisted that such 'mechanical' measures are typically failures that produce dependency; in so far as the poor should be assisted, it must be accomplished through charity focusing on the detailed needs of each recipient—thus pointing to the importance of private social work. This separated Bosanquet from the 'new liberals' (who endorsed the welfare state), reinforcing the erroneous perception that Bosanquet was a Tory; throughout his life he was an active political liberal and reformer.[3]

The problem of the relation of Green's and Bosanquet's idealisms to their liberal politics can be resolved into three more specific questions. Firstly, in what ways are the political and moral views of Green and Bosanquet affected by their idealism? Though almost invariably referred to as the 'British idealists', the relation of their philosophy (logic, epistemology and metaphysics) to their moral and political theory remains, I think, obscure. Secondly, are their moral and political views liberal or, as is often charged, statist and illiberal? Thirdly, our answers to these questions should enlighten us on a third: is Bosanquet a *bona fide* follower of Green, or was Hobhouse right that he perverted Green's teachings?

EPISTEMOLOGY AND METAPHYSICS

Philosophy and coherence

Bosanquet called his major work in political philosophy *The Philosophical Theory of the State;* as I have said, Hobhouse's critique was entitled *The Metaphysical Theory of the State,* suggesting that Bosanquet understood philosophy as essentially metaphysics. Yet this is not quite right. In the first paragraph of the *Philosophical Theory of the State,* Bosanquet explains what he means by a 'philosophical theory': 'a philosophical treatment is the study of something as a whole and for its own sake' ([14.14], 1). Later on he tells us that philosophy aims to establish 'degrees of value, degrees of reality, degrees of completeness and coherence' ([14.14], 47). For Bosanquet, as for Green, philosophy in its various guises aims at completion and harmony: epistemology, metaphysics, philosophical ethics and political philosophy are all manifestations of philosophy's search for coherence and completion.

Reason and knowledge

Given this, it is most helpful to start from the perspective of epistemology. Coherence is the basic demand of reason itself. In contrast to, say, Hobbes, reason is not understood as

essentially calculative—a matter of 'reckoning, that is, adding and subtracting, of the consequences of general names agreed upon for the marking and signifying of thoughts' (Hobbes, [14.34], 26). The 'inherent nature of reason', argues Bosanquet, is 'the absolute demand for totality and consistency' ([14.11], 8). It cannot be overemphasized that reason is a demand or, as Bosanquet says elsewhere, an 'impulse' ([14.13]:130). Logic 'is merely the same as the impulse to the whole' ([14.11], 7). That reason is an impulse driving us to expand and systematize our experiences allows us to make sense of Bosanquet's otherwise obscure remark that 'it is a strict fundamental truth that love is the mainspring of logic' ([14.15], 341); both are expressions of the unifying and expanding impulse.[4]

To obtain knowledge, then, is to bring unity to our particular experiences, 'through which phenomena become the connected system called the world of experience' (Green [14.1], 15). We are thus led to a coherence theory of knowledge; to know that *p* is for *p* to be related to, and to cohere with, the rest of one's beliefs or experiences. We need, though, to be careful here, for coherence goes considerably beyond requirements of formal consistency (Bosanquet [14.6], 2, chapter VII). Most importantly, coherence includes connectedness among beliefs and a richness of content ([14.15], 146); one who obtains consistency by compartmentalizing his or her system so that some beliefs are never related to others, or by impoverishing his or her experience (so that there is less that can conflict with the rest) to that extent falls short of the ideal of coherence. The fully coherent system would have to be complete, i.e., contain all true propositions.

Knowers and the known

Except for their insistence on the affective nature of reason, Green's and Bosanquet's epistemology is not terribly different from contemporary coherence theories of knowledge. The great gulf separating classical idealism from contemporary philosophy is the relation of the theory of knowledge to truth.[5] One contemporary view, endorsed by Laurence Bonjour, is to combine a coherence theory of knowledge with a correspondence theory of truth. He writes:

> [O]ur concern is with coherence theories of *empirical justification* and not coherence theories *of truth;* the latter hold that truth is to be simply *identified* with coherence…. The classical idealist proponents of coherence theories in fact generally held views of both these sorts and unfortunately failed for the most part to distinguish them. And this sort of confusion is abetted by views which use the phrase 'theory of truth' to mean a theory of the *criteria,* of truth, that is, a theory of the standards or rules which should be appealed to in deciding or judging whether something is true; if, as is virtually always the case, such a theory is meant to be an account of the criteria which can be used to arrive at a rational or warranted judgment of truth or falsity, then a coherence theory of truth in that sense would seem to be indiscernible from what is here called a coherence theory of justification, and is quite distinct from a coherence theory of the very nature or meaning of truth. But if these confusions are avoided, it is clear that coherence theories of empirical justification are both distinct from and

> initially a good deal more plausible than coherence theories of the very nature or meaning of empirical truth and moreover that there is no manifest absurdity in combining a coherence theory of justification with a *correspondence* theory of truth.
>
> ([14.18], 88)

Now whatever other philosophical errors the classical idealists committed (and no doubt there were many), confusing coherence theories of justification (or, as they might say, understanding) with coherence theories of truth was not one of them. Indeed, it is the apparent implausibility of a Bonjour-like proposal that, for Green, makes it necessary to embrace a coherence theory of truth. In the *Prolegomena*, having analysed our understanding of nature in terms of systematizing the objects of consciousness, Green writes:

> Now that which the understanding thus presents to itself consists, as we have seen, in certain relations regarded as forming a single system. The next question, then, will be whether understanding can be held to 'make nature' in the further sense that it is the source, or at any rate a condition, of there being these relations. If it cannot, we are left in the awkward position of having to suppose that, while the conception of nature on the one side, and that of the order itself on the other, are of different and independent origin, there is yet some unaccountable pre-established harmony through which there comes to be such an order corresponding to our conception of it.
>
> ([14.1], 22–3)

For Green, to suppose that our understanding was achieved through coherence but that truth consisted in the correspondence of our beliefs with a pre-existing nature would make it utterly mysterious how pursuit of coherence reveals the truth about nature; only by supposing an established harmony between our reason and nature could this be so, but such a harmony is an implausibly strong assumption. The core idealist conviction is that, having replaced a representational theory of knowledge with a coherence account, this account can be maintained only by characterizing truth itself in terms of coherence.[6] It is not simply that justified belief is a matter of coherence, but the very essence of truth is coherence and completeness. 'The truth is the whole' ([14.6], 2:204).

Idealism guarantees that the truth—what nature is really like—is the coherent whole since nature is ultimately mind-dependent; nature is constituted by the unifying and completing force of mind. That being so, what the coherent mind knows *is* nature. But, of course, actual individual minds disagree about what nature is like; if each personal mind constituted its own nature, there would be as many natures as there are minds. Moreover, it would be obscure what scientific discovery could amount to; science searches for what exists but is yet not known. To avoid such difficulties reality cannot be dependent upon individual minds; hence we are led from personal idealism to Absolute idealism. Though Green is sometimes called a personal and not an Absolute idealist, this is surely wrong, for Green's idea of an 'Eternal Consciousness' is straightforwardly Hegelian:

> That there is one spiritual self-conscious being, of which all that is real is the activity or expression; that we are related to this spiritual being, not merely as parts of the world which is its expression, but as partakers in some inchoate measure of the self-consciousness through which it at once constitutes and distinguishes itself from the world; that this participation is the source of morality and religion; this is what we take as to be the vital truth which Hegel had to teach.
>
> ([14.2], 146)[7]

The Eternal Consciousness—which Green identifies with God—is an all-inclusive consciousness; it is the mind upon which reality rests. Green apparently conceives of finite minds as somehow participating in the Eternal Consciousness—coming to consciousness of the relations in the Eternal Consciousness. The growth of our knowledge is, then, our increasing awareness of the Eternal Consciousness ([14.1], 75).

Though much more developed, Bosanquet's theory of the Absolute is not, I think, fundamentally different.[8] For Bosanquet, the Absolute is the perfection of mind's pursuit of coherence; it is the complete and harmonious mind. Or, rather, it is the systematization and completion of finite minds.[9] 'The general formula of the Absolute', Bosanquet wrote, is 'the transmutation and rearrangement of particular experiences, and also the contents of individual minds, by inclusion in a more complete whole of experience' ([14.15], 373). And being the more complete and more harmonious mind, it is ultimate reality, since reality is mind-dependent. A recurring theme in Bosanquet's philosophy is that the more harmonious and complete is the more real, a position that follows easily enough from the coherence view of knowledge combined with Absolute idealism. The upshot of this, of course, is that finite (i.e., personal) minds are incomplete and contradictory, and so less real. Though not as relentless as Bosanquet in insisting on this point, Green's idealism based on the Eternal Consciousness too identifies the real with 'everything' ([14.1], 27).

Idealist metaphysics, ethics and politics

On the account I have sketched, it is misguided to understand Green's and Bosanquet's idealism as primarily a metaphysical theory, i.e., a theory about the nature of reality. Rather, their philosophy is based on (1) a conception of reason as a unifying, affective, force, (2) a coherence theory of knowledge or understanding, according to which knowledge is a system of relations, and so to know something is to relate it to our other beliefs; (3) an Absolute idealism, which was understood as the most plausible concomitant of (1) and (2).[10] None of these elements is fundamental in the sense of being the basic doctrine from which the others are derived. On my account, the epistemological project leads to the metaphysical; that is, I believe that the former is the best way to explain the motivation behind the latter. But certainly the metaphysics in no way derives from the accounts of reason and knowledge (recall here Bonjour's position). All three doctrines are manifestations of the overarching notion of coherence, the real key to understanding the idealism of Green and Bosanquet.

Understanding the philosophy of the British idealists in this way allows us to approach an old question in a new light: do their moral and political philosophies derive from their

metaphysics? My answer should not be surprising: talk of ‘derivation’ is misleading. Their accounts of the self, moral perfection, the common good, general will and the State are all applications of the ideal of coherence. This is not to say they are unrelated to the other elements of their philosophy; the analysis of reason, knowledge and reality lends plausibility to, and helps justify, their moral and political doctrines. In true coherentist fashion, the various doctrines are mutually reinforcing and justifying.[11] It is, then, fruitless to look for any single doctrine from which the rest follow.

THE SELF AND ITS PERFECTION

The self as a system of content

Having stressed that point, it also must be acknowledged that Bosanquet’s and Green’s analyses of selfhood are applications of their accounts of mind. If ‘the peculiarity of mind, for us, is to be a world of experience working itself out towards harmony and completeness’ (Bosanquet [14.15], 193), the same applies to selfhood; the self is an organization of content striving for coherence and completion (Bosanquet [14.11], 48; [14.15], 242). To say this is to emphasize that selfhood is not understood as being constituted by an abstract entity or pure ego (Green [14.1], 103–4; Bosanquet [14.10], 55); for Bosanquet and Green the self is not something apart from ‘feelings, desires and thoughts’ (Green [14.1], 104), but their unification and systematization. Bosanquet made much of the contrast to J.S.Mill, for whom true individuality consisted in the cultivation of ‘an inner self, to be cherished by enclosing it’ ([14.14], 57). This, Bosanquet admonished, was to get things precisely wrong; it locates individuality in a core of essentially empty privateness rather than an expansion of feelings, interests and experiences. ‘Individuality is essentially a positive conception…. Its essence lies in the richness and completeness of a self’ ([14.15], 69; [14.10], 89).[12]

On one side, then, Bosanquet and Green rejected ‘formal’ accounts of the self in terms of an abstract ego. However, they also criticized Humean or associationist accounts, which located the self (or, rather, failed to) in a series of contents. No mere succession of desires, feelings and thoughts could constitute a self; though the self is ‘not something apart from feelings, desires and thoughts’, it is not just simply them: it is ‘that which unites them’ (Green [14.1], 104; [14.4], 339–41).[13] This, though, immediately threatens to lead back towards positing a ‘mysterious abstract entity which you call the self ([14.1], 104) that is different from, but unites, the feelings, desires and ideas that form the content of the self. In responding to this problem, I would suggest, Green and Bosanquet display their most important divergence, one which, we shall see, has significant consequences for their ethics and political philosophy.

Green’s proposal has two elements. Firstly (and with this Bosanquet agrees), he stresses that the self cannot be a mere succession of thoughts, feelings and desires, but must form an organized system. Here Green’s epistemology and metaphysics do come into play. For to understand an experience is to relate it to the rest of one’s experiences, and for something to be real is for it to be located in such a web of understanding. This allows Green to turn the tables on Hume:

> If we are told that the Ego or self is an abstraction from the facts of our inner experience—something which we 'accustom ourselves to suppose' as the basis or substratum for these, but which exists only logically, not really,—it is a fair rejoinder, that these so-called facts, our particular feelings, desires, and thoughts, are abstractions, if considered otherwise than as united in an agent who is an object to himself.
>
> ([14.1], 104; see Thomas [14.56], 177)

Green introduces here the second element of his reply: not only must desires, feelings and thoughts be systematized for them to be real and not abstract but the system must be self-conscious—one must be able to be an object to oneself. For Green such consciousness is absolutely fundamental to selfhood; indeed, his account of selfhood is essentially an account of self-consciousness, of an agent who is able to grasp his system of desires as 'an object to himself.

Though both elements are present in Bosanquet's theory of the self, there is a marked stress on the organizational aspect and a deemphasising of self-consciousness. Bosanquet too rejects associationist views of the self: 'In mind…the higher stage of association is organization. The characteristic of organization is control by a general scheme, as opposed to juxtaposition of units' ([14.14] 152). In his *Psychology of the Moral Self* Bosanquet developed his account of the organization of the self in depth. 'The psychical elements of the mind are so grouped and interconnected', he wrote, 'as to constitute what are technically known as Appercipient masses or systems' ([14.10], 42).[14] Such a system, Bosanquet writes, is a

> set of ideas, bound together by a common rule or scheme, which dictates the point of view from which perception will take place, so far as the system in question is active. And without some 'apperception', some point of view in the mind which enables the new-comer to be classed, there cannot be perception at all. The eye only sees what it brings with it the power of seeing…. A child calls an orange a 'ball'; a Polynesian calls a horse a 'pig'. These are the nearest 'heads' or rules under which the new perception can be brought.
>
> ([14.14], 155)

A person organizes experience in terms of these 'schemes of attention'; as different situations arise, one mass will arise to prominence in consciousness, leaving the others inert ([14.14], 162). The self,[15] then, is a multiplicity of such systems. However, because one appercipient mass forces the others from consciousness, the self is always imperfectly coherent; inconsistencies and contradictions are hidden because different systems do not rise to consciousness at the same time.

Note that, though consciousness is a necessary element of this theory, it does not have the dominant role that Green ascribes to a person who can grasp his system of desires as 'an object to himself. In contrast to Green, Bosanquet makes a great deal of the extent to which 'an adult mind contains an immense structure of automatic machinery' ([14.15], 181); the automatic, and so unconscious, aspect of selfhood always looms large in

Bosanquet's theory. The idea of an 'I' who unites desires into a system is replaced by the theory of appercipient mass. Self-consciousness now seems to be more a recognizer than a forger of unity.[16]

Self-perfection

Perhaps not quite. Bosanquet certainly recognizes that the self strives for greater coherence. Our nature as self-conscious beings is, he says, to strive for harmony and unity ([14.11], 193–4; [14.16], 189). Indeed, he classifies himself and Green as 'Perfectionists' ([14.16], 208ff.). Their account of self-perfection can be analysed into four claims.

The good

Green and Bosanquet accept the Hegelian critique of Kant: his doctrine of the 'Good Will' is 'ultimately an empty abstraction, an idea of nothing in particular to be done' ([14.4], 154). The first step in rectifying this over-formality is an account of the good: the good, says, Green, satisfies desire ([14.1], 178). The argument, though, quickly takes an Aristotelian turn, stressing the pursuit of perfection, or the development of capacities, as the basis of self-satisfaction:

> The reason and will of man have their common ground in that characteristic of being an object to himself…. It is thus that he not merely desires but seeks to satisfy himself in gaining the objects of his desire; presents to himself a certain state of himself, which is the gratification of the desire he seeks to reach; in short wills. It is thus, again, that he has an impulse to make himself what he has the possibility of becoming but actually is not, and hence not merely, like the plant or animal, undergoes a process of development but seeks to, and does, develop himself.
>
> ([14.1], 182)

This impulse to develop, Green goes on to say, is an impulse to realize one's capacities. Thus Green ultimately holds that a person's good is identified with the development of his capacities, especially the intellectual. Both Green and Bosanquet maintain that individuals have natural capacities for intellectual, social and artistic endeavours (including handicrafts),[18] the cultivation of which is the ground of self-perfection.

Self-satisfaction and coherence

Thus far the impulse to develop is not moralized; it is, says Green, 'the source, according to the direction it takes, both of vice and virtue' ([14.1], 183). Some attempts at self-satisfaction are 'self-defeating', as 'is the quest for self-satisfaction in the life of the voluptuary' (183). The self, we have seen, is a system of content, and reason is an impulse towards completion and unity. Applied to the development of our capacities, this leads to the idea that self-satisfaction—as opposed to the satisfaction of discrete desires

or capacities—requires the development of our capacities into a coherent whole. 'The state of mind in question…is that in which the impulse towards self-satisfaction sets itself upon an object which represents the self as a whole, as free from contradiction or at its maximum of being, and triumphs over the alien and partial will, the tendency to narrower tracks of indulgence' ([14.14], 132). Green's view is much the same, though as always he stresses the role of self-consciousness as crucial, in this instance its role in distinguishing mere desires from those that are self-satisfying ([14.4], 304). In any event, this distinction allows Green and Bosanquet to identify capacities as good or evil in terms of their ability to be integrated into a coherent system of developed capacities. A person developing capacities that cannot be integrated into the whole, such as the voluptuary, can satisfy some of his or her desires, but cannot find self-satisfaction.

An obvious rejoinder presents itself: if a self is organized around only voluptuary interests, coherence can be obtained and, it would seem, self-satisfaction too. But this will not do. As we have seen, coherence goes beyond mere consistency to include fullness of content. Consequently, Bosanquet analyses selfishness as an effort to seek coherence through narrowing rather than expanding the self ([14.10], 97). This path to coherence is ultimately self-defeating. Since reason is an impulse to coherence and completion, seeking coherence through narrowing is irrational, or, as Bosanquet says in his sometimes colourful way, it 'involves stupidity' ([14.13], 232).[19] Remember here that reason is an impulse; such stupidity thus seeks to block our rational impulse towards coherence. Consequently, the success of the narrowing strategy is always illusory:

> It is the narrowness of a man's mind that makes him do wrong. He desires more than he can deal with; indeed he aspires to be self-complete. But what he can make his own, as a set of values which do not conflict, is little. And of what is extruded something refuses to be suppressed and forms the nucleus of rebellion. Thus the good we are able to aim at is narrow and distorted, and more than that, the elements of the good which our narrowness forces us to reject lie in ambush to conflict with the good we recognise, itself poor and narrow and so weakened for the struggle.
>
> ([14.13] 107; see also [14.14], 135–7)

This is Bosanquet's description of the 'bad self or evil will'. The 'good will', then, is determined by 'the connected system of values, that is to say, as much of it as we can appreciate' ([14.13], 133). The Kantian concept of the good will is thus transformed into a will determined by reason in the sense of a coherent system of capacities or values.[20]

Diversity

It may appear to follow from this that the impulse towards self-satisfaction would lead to the development of essentially similar selves. We all seem committed to essentially the same project: the harmonization of as many capacities or values as possible. This, though, is precisely the view Green and Bosanquet reject (see Green [14.1], 201). As Bosanquet puts it, 'It takes all sorts to make a world' ([14.15], 37). Individual quests for self-satisfaction lead to the development of diverse personalities, and this for at least three

reasons. Firstly, individual natures differ: people are born with different capacities, some excelling in intellectual pursuits, some in the arts, some in crafts and so forth. Given these different starting points, the quest for coherence leads us in different directions.[21] Secondly, Green ([14.2] 3–19; [14.1], 201, 256) and especially Bosanquet recognized that external circumstances can profoundly influence the course of one's self-development. Bosanquet repeatedly stressed that 'The soul or self is formed by the requirements of its surroundings; that is, the universe so far as it has contact with it' ([14.11], 91).[22] Our different circumstances thus lead us to develop our capacities in different directions. Lastly, even apart from differences in individual natures and circumstances, the very richness of human possibilities means that, if we are to cultivate our capacities at all, we must specialize: 'in the development of human nature, which we take to be the ultimate standard of life, no one individual can cover the whole ground' ([14.14], 164).

Our inherent imperfection

If no one individual can cover the full ground of human nature, no one can attain absolute perfection—a coherent self encompassing all values. As Bosanquet would say, our finite nature limits us, absolute perfection is impossible; at one point Bosanquet goes so far as to declare that 'man is a self-contradictory being, in an environment to which he can never be adapted' ([14.12], 300). The best we can accomplish is a narrow, imperfect coherence. And since a narrow coherence is the root of evil, 'evil and suffering must be permanent in the world' (300). In one of his rare criticisms of Green, Bosanquet charges that Green underestimated the gap 'between human experience and perfection' ([14.16], 165). And it is, I think, true that the gap between the human condition and perfection is a much more important theme in Bosanquet than in Green.[23] To be sure, Green is explicit that we cannot have an adequate conception of what perfection would look like, since we have not as yet obtained it: '[o]f what ultimate well-being may be, therefore, we are unable to say anything but that it must be the complete fulfillment of capacities.' Yet Green goes on to insist that 'the idea that there is such an ultimate well-being may be the guiding idea of our lives', and so we judge a particular person's life on the basis of how closely it approaches 'the end in which alone he can find satisfaction for himself' ([14.1], 256).

In all this there is at least a suggestion that we do not fall hopelessly short of perfection. Yet the difference between Green and Bosanquet here is a matter of nuance. Green too accepts that the individual has absolute limitations on the possibility for self-realization; the 'dream' that these can be done away with is 'the frenzy of philosophy' ([14.2], 86). In true idealist fashion Green insists that 'the whole can never be fully seen in the parts' (86). True perfection can exist only in the overall coherent system of values, which no individual life can fully express.

SOCIETY, THE COMMON GOOD AND THE GENERAL WILL

Society as an organic whole

An individual's pursuit of perfection requires participation in social life. This is obviously true, of course, in the perfectly straightforward sense that society 'supplies all the higher content' to one's conception of oneself, 'all those objects of a man's personal interest, in living for which he lives for his own satisfaction, except such as are derived from his purely animal nature' (Green [14.1], 201). More fundamentally, Green and Bosanquet follow Hegel in insisting that 'it is through the action of society that the individual comes at once to practically conceive his personality—his nature of an object to himself—and to conceive the same personality as belonging to others' (Green [14.1]). It is only through 'some practical recognition of personality by another, of an "I" by a "Thou" and a "Thou" by an "I"' (Green [14.1], 210) that consciousness of personality arises (see Bosanquet [14.10], 49–50).

All this, though, is commonplace. Of much more interest is that reason—the impulse to coherence—leads us to participate in a more inclusive scheme of value, which covers the ground of human nature more fully than can any single life. One who pursues perfection must, as I have said, develop only some of the many capacities inherent in human nature; no matter how successful one is in doing so, one ultimately realizes that one's perfection is really imperfect, i.e., partial and incomplete. It is here that our impulse to unite values into a coherent scheme leads us into social life. As Bosanquet understands it, 'our imperfection [i.e., partiality] enables us to better stand for something which is to have its due stress in the whole' ([14.11], 61). But the overall system, encompassing these many partial excellences, more closely approaches perfection than any single element. The different partial perfections of others thus complement and complete one's own; the 'ultimate coherence of all excellences' ([14.15, 379) is better manifested in a complex social life that unites and harmonizes the diverse partial excellences of individuals. Consequently, the same principle that unifies the self also explains the unity of the self with others ([14.15], 315).

This allows us to make sense of the much-abused claim that society is an organism. Bosanquet quite clearly did not mean that, just as the end of all the body parts is the survival of the organism, we should all make service to society our end ([14.15], 9). The idea, rather, is that organic unity is a mode of organization based on interlocking and complementary differences, the totality of which is in some way more complete than any of the elements. Often Bosanquet called such a unity a 'world' or a 'cosmos':

> A world or a cosmos is a system of members, such that every member, being *ex hypothesi* distinct, nevertheless contributes to the unity of the whole in virtue of the peculiarities which constitute its distinctness. And the important point for us at present is the distinction between a world and a class. It takes all sorts to make a world; a class is essentially of one sort only.
>
> ([14.11] 37)

So understood, the idea that society is an organism is not illiberal. It stresses that co-operative systems based on diverse individual aims and capacities can accomplish more than can any single individual alone, something a student of the market should not find troubling, at least so long as, in Bosanquet's words, every member remains 'distinct'. It is here, perhaps, that Bosanquet gets into difficulty. Recall that according to Bosanquet's theory of appercipient masses, a self is composed of a number of such systems (pp. 414–16). This suggests a three-level theory of coherence: (1) each appercipient system is unified by a leading idea, and so organizes an aspect of experience or personality; (2) the individual self is an organization of these appercipient systems; and (3) a social group is an organization of individual selves. The problem is that the second level of coherence tends to get squeezed out, leading to an account of social unity in terms of simply (1) and (3). Bosanquet acknowledges that

> in some examples…there seems little reason to distinguish the correlation of dispositions within one person from the correlation of the same dispositions if dispersed among different persons. If I am my own gardener, or my own critic, or my own doctor, does the relation of the answering dispositions within my being differ absolutely and altogether from what takes place when gardener and master, critic and author, patient and doctor, are different persons?… If we consider my unity with myself at different times as the limiting case, we shall find it very hard to establish a difference in principle between the unity of what we call one mind and that of all the 'minds' which enter into a single social experience.
>
> ([14.14], 165–6)[24]

Though Bosanquet insists that 'there is no suggestion that selfhood is a trivial or unreal thing' ([14.15], 298), one could well be excused for thinking he may be suggesting just that. The difficulty, at least on the view I have been developing here, is that Bosanquet's theory of the self puts such great weight on the principle of coherence, while relatively so much less on self-consciousness. To the extent selfhood is to be accounted for simply in terms of coherence, there is indeed a pressure for this middle level of coherence (the self) to evaporate as first level unities (the appercipient masses) form larger systems, be they within the same human or across a number of people.

Green avoids these difficulties by always insisting on a person's self-consciousness as the fundamental unifying factor.[25] Green too believes that 'it is human society as a whole that we must look upon as the organism in which the capacities of the human soul are unfolded' ([14.1] 295). And, Green also believes that our excellences are complementary and interlocking (pp. 420–1). However, as we have seen, Green puts great stress on each individual as a centre of self-consciousness. Hence, even while insisting that perfection must occur in an organic society, Green can immediately add that 'Human society is indeed a society of self-determined persons. There can be no progress of society which is not a development of capacities on the part of persons composing it, as ends in themselves' ([14.1], 295). The individual self is in no danger of evaporating in Green's account of the organic whole. This becomes even clearer when we examine his theory of the common good.

Green's theory of the common good

Green begins his section of the *Prolegomena* on 'reason as the source of the idea of a common good' by claiming that a 'distinctive social interest on our part is a primary fact'.

> Now the self of which a man thus forecasts the fulfillment, is not an abstract or empty self. It is a self already affected by manifold interests, among which are interests in other persons. These are not merely interests dependent on other persons for the means to their gratification, but interests in the good of those persons, interests which cannot be satisfied without the consciousness that those other persons are satisfied. The man cannot contemplate himself as in a better state, or on the way to the best, without contemplating others, not merely as a means to that better state, but as sharing it with him.
>
> ([14.1], 210)

It is, Green claims, 'an ultimate fact of human history that out of sympathies of animal origin, through their presence in a self-conscious soul, there arise interests as of a person in persons' ([14.1], 212). Note the contrast to Bosanquet. Though both insist that reason leads us from our own perfection narrowly conceived to a concern with perfection in others, for Green this is crucially an interest in the perfection *of other persons*, not simply in the perfection of the capacities of human nature. It is not trivial that while Bosanquet claims that 'the development of human nature' is 'the ultimate standard of life' ([14.14], 164), Green insists that 'our ultimate standard of worth is an ideal of *personal* worth' ([14.1], 193). For Bosanquet, society is an intermeshing of developed capacities or values; for Green it is an intermeshing development of persons.

Those who uphold Green's liberalism while insisting upon Bosanquet's illiberalism are apt to stress just this point (e.g., Morrow, [14.43], 94). Two problems, however, confront this 'liberal' aspect of Green's theory. Firstly, Green can certainly say, as he does, that '[a]ll values are relative to value for, of, or in a person' in the sense that '[t]o speak of any progress or improvement or development of a nation or society or mankind, except as relative to some greater worth of persons, is to use words without meaning' ([14.1], 193). Yet this worth of persons cannot be 'ultimate'. As Bosanquet was fond of stressing, 'some particular personality becomes important by what it embodies' ([14.15], 22). Our value as persons derives ultimately from our contribution to the overall system of value (and this opens up the rather unsettling possibility that some persons may be in 'surplusage', i.e., those who make no unique contribution to the whole; Bosanquet [14.15], 116). The value must ultimately reside in the whole rather than the parts. To be sure, in contrast to Bosanquet's, in Green's theory the development of *persons* as opposed to capacities or values is essential for perfection of the whole, but this leads to the second problem. In order to extend the principle of coherent, intermeshing, personal development to the social order, Green postulates a distinctive interest of people in each other's perfection: the perfection of personality becomes the crucial value in the overall scheme of things. To the extent that this interest really is claimed to be a 'primary fact', it

invites Sidgwick's rejoinder that it is not 'justified by anything we know about the essential sociality of ordinary human beings' (Sidgwick [14.54], 57). In contrast, Bosanquet's theory supposes no additional social impulse; just as reason leads to the systematization of interests and values within a self, it leads to a social organic unity.

According to Green, then, the common good includes the good of all: it is the harmonious realization of all our individual perfections.[26] That which promotes the common good can be willed by all, and so the common good provides the substantive element that was lacking in Kantian ethics. Reason is realized in one's idea of 'self-perfection, by acting as a member of a social organization, in which each contributes to the better well-being of all the rest' ([14.5], 16). In addition, the theory of the common good provides an account of the motivation to be moral; since our good includes the good of others, the pursuit of our own good necessarily involves the common good, and so the good of others. 'The only reason why a man should not be used by other men as a means to their ends is that he should use himself as a means to an end which is really his and theirs at once' ([14.5] 120).

Upon reflection, however, the extent to which Green has provided substance to the Kantian moral ideal may seem fairly modest; a standard criticism is that the idea of the common good is at best vague and at worst empty (see Nicholson [14.45], 71–80). The crux of Green's reply is given in the previous paragraph: we achieve self-perfection by *'acting as a member of a social organization'*. The cultivation of one's capacities is a social activity not just because it involves the perfection of others but because it relies on the 'institutions of civil life' which give 'reality to these capacities, as enabling them to be really exercised' ([14.5], 16). This leads Green to endorse a theory of one's station and its duties:

> The idea, unexpressed and inexpressible, of some absolute and all-embracing end is, no doubt, the source of…devotion, but it can only take effect in the fulfillment in which it finds but a restricted utterance. It is in fact only so far as we are members of a society, of which we can conceive the common good as our own, that the idea has any practical hold on us at all, and this very membership implies confinement in our individual realisation of the idea. Each has primarily to fulfill the duties of his station. His capacity for action beyond the range of those duties is definitely bounded, and within it is definitely bounded also his sphere of personal interests, his character, his *realised* possibility.
>
> ([14.1], 192; see also 341–2)

Green thus understands a social order as a harmonious—or at least largely harmonious—integration of social roles, such that each person's roles allow one to organize one's capacities while contributing to the satisfaction of others (Thomas [14.56], 302). This does not commit Green to a rigid conservatism; room remains for adjusting social roles to render them more coherent, which includes making them more inclusive (indeed, as we will see, that is a crucial function of the State; [14.56], 292). But it certainly does mean that one's possibilities for self-perfection are very much sensitive to the social structure and roles available. Moreover, Green is quite clear that, while an actual system of stations

and duties is necessary for self-perfection, it also confines avenues for development.

Bosanquet's theory of the general will

Bosanquet endorses both the doctrines of (1) the common good and (2) my station and its duties. 'The individual', said Bosanquet, 'has his nature communicated to him as he is summoned to fit himself for rendering a distinctive service to the common good' ([14.14], 290; see also [14.17], 113). Bosanquet acknowledges that he follows Green very closely on such matters, but believed that his exploration of the psychological foundations of the general will was one his important contributions ([14.14], viii).

Green himself suggested the link between the common good and the general will in his *Lectures on the Principles of Political Obligation*, where he remarked that 'the truth' latent in Rousseau's doctrine of the general will is that 'an interest in the common good is the ground of political society' ([14.5], 70). Following Rousseau, Bosanquet characterizes the general will as the will of the entire society so far as it aims at the common good ([14.14], 99). But just what sort of 'will' can a whole society share? Bosanquet believes that the key to the answer is in Plato's political philosophy:

> The central idea is this: that every class of persons in the community—the statesman, the soldier, the workman—has a certain distinctive type of mind which fits its members for their functions, and that the community essentially consists in the working of these types of mind in their connection with one another, which connection constitutes their subordination to the common good.
>
> ([14.14], 6)

This brings us back to Bosanquet's theory of social unity and appercipient masses. 'Every individual mind, so far as it thinks and acts in definite schemes or contexts, is a structure of appercipient systems or organized dispositions' ([14.14], 161). Now, Bosanquet goes on to argue, those participating in the same social institution or social group—those who share a common life—possess similar appercipient systems; their minds are similarly organized, and it is this which constitutes their common mind and will ([14.14], 161–2).

> Not only may the systems of appercipient masses be *compared* to organizations of persons; they actually constitute their common mind and will. To say that certain persons have common interests means in this or that respect their minds are similarly organized, that they will react in the same or correlative ways upon given presentations. It is this identity of mental organization which is the psychological justification for the doctrine of the General Will.
>
> ([14.10], 129; see Chapman [14.22], 129–30)

So those who share common interests share similar mental organization, and it is this shared mental organization that is articulated by the general will. Note that at this point Bosanquet depends not simply on coherence—on a fitting together of different minds into a broader unity—but on similarity of organization. 'All mutual intelligence', Bosanquet claims, 'depends upon the fact that individuals cover each other in some degree' ([14.15],

116n.); social organization thus depends on the similarity or repetition of selves. It is not entirely clear how this principle of social life as based on similarity of organization coheres with that of organic unity,[27] but it does at least allow Bosanquet to argue that a general will is necessarily limited to a community sharing a common life. '[T]he common life shared by the members of a community involves a common element in their ideas, not merely in their notions of things about them, though this is very important, but more especially in the dominant or organizing ideas which rule their minds' ([14.16], 260). Consequently, those sharing no common life—such as mankind as a whole—cannot possess a general will ([14.12], 271–301).

The general will, Bosanquet claimed, is our 'real will', which can be contrasted to our 'actual will'. This distinction, which drives most liberals to distraction (e.g., Berlin [14.19], 133; Hobhouse [14.37], 44ff.)[28] follows easily enough from Bosanquet's analyses of self, the common good and reality. The self, we saw, is a system of desires, interests and beliefs, which reason seeks to make harmonious. Of course, actual selves are shot with contradictions 'through and through' ([14.14], 111). As we saw, appercipient systems tend to crowd each other out; that which is conscious displaces the others, making it very difficult to render the entire system coherent.

> In order to obtain a full statement of what we will, what we want at any moment must at least be corrected and amended by what we want at other moments; and this cannot be done without also correcting and amending it so as to harmonize with what others want, which involves the application of the same process to them. But when any considerable degree of such correction had been gone through, our own will would return to us in a shape in which we should not know it again, although every detail would be a necessary inference from the whole and resolutions which we actually cherish…. Such a process of harmonization and adjusting a mass of data to bring them into rational shape is what is meant by criticism.
>
> ([14.14], 111)

Thus Bosanquet's first claim is that a fully coherent self and will, which took into account our interest in the common good, would be very different from a self and will that had not undergone this process of rational reconstruction. The second claim, that the former is more real than the latter follows directly from the idealist claim that the criterion of reality is coherence—that with greater coherence is more real.

THE STATE

Bosanquet: the general will and the state

Most readers share Hobhouse's conviction that Bosanquet's theory of the general will justifies authoritarianism. If (1) the general will is our real will and if (2) the government interprets the general will, then (3) when the government tells us what to do it is really only informing us what we really want to do. And if (4) the government forces us to do as

it instructs it is only forcing us to do what we really want to do. 'Thus it is that we can speak, without a contradiction, of being forced to be free' ([14.14], 118–19).[29] But this is to misrepresent Bosanquet's theory; the problem lies in step (2), the idea that the government interprets the general will (see Nicholson [14.45], 214–15).

To be sure the *State* does represent, at least partially, the real will ([14.14], 141). But the State is not the government. The State 'includes the entire hierarchy of institutions by which life is determined, from the family to the trade, and from the trade to the Church and the University' (140). Such institutions are systems of similarly and correlatively organized minds; the State is a system of those systems; its aim is unified coherence among these institutions.

> It is plain that unless, on the whole, a working harmony were maintained between the different groups which form society, life could not go on. And it is for this reason that the State, as the widest grouping whose members are effectively united by a common experience [and, so a general will], is necessarily the one community which has absolute power to ensure, by force if need be, at least sufficient adjustment of the claims of all other groups to make life possible. Assuming, indeed, that all the groupings are organs of a single pervading life, we find it impossible that there should ultimately be irreconcilable opposition between them.
>
> ([14.14] 158)

But, as should be clear by now, no one individual, indeed no group of individuals, can be conscious of the system of intelligence that constitutes society. That would be for a part to fully know the whole, a claim that runs counter to almost every aspect of Bosanquet's philosophy. Consequently, Bosanquet is suspicious of claims by individuals that they know the general will. He is thus a harsh critic of Rousseau's attempt to uncover the general will through direct democracy; in the end, all Rousseau's method reveals is the 'will of all'.

> [T]he very core of the common good represented by the life of the modern Nation-State is its profound and complex organization, which makes it greater than the conscious momentary will of any individual. By reducing the machinery for the expression of the common good to the isolated and unassisted judgments of the members of the whole body of citizens, Rousseau is ensuring the exact reverse of what he professes to aim at. He is appealing from the organized life, institutions, and selected capacity of a nation to that nation regarded as an aggregate of isolated individuals.
>
> ([14.14], 109)

Bosanquet is thus hesitant about endorsing state policies intended to articulate the general will: 'our life is probably more rational than our opinions' ([14.16], 218). This does not mean that Bosanquet opposes the reform of institutions,[30] but it does imply that such reform is best worked out by the participants who engage in the common life that comprises those institutions. Moreover, Bosanquet is very impressed by the way in which

inadequate knowledge of institutions and ways of life leads to reforms with deleterious consequences, such as poor relief that produces dependency ([14.7]: 3ff., 45ff.; [14.17], 103–16). To be sure, Bosanquet does not embrace what he calls 'administrative nihilism', i.e., refusal ever to employ conscious policy to further the common good ([14.17], 301; [14.9], 358–83; [14.14], xxxvi). The 'distinctive sphere' of State agency 'is rightly described as the hindrance of hindrances of good life' ([14.14], xxxii). However, Bosanquet was an adamant critic of economic socialism, precisely because it sought to impose a conscious plan on society. In contrast to economic individual-ism, economic socialism, he charged, seeks to substitute a mechanical, contrived, unity for the organic unity of society. 'I confess that I believe modern Economic Socialism to rest *in part* on this ineradicable confusion. "We want a good life; let us make a law that there shall be a general good life"' ([14.9], 316, 330).

Green's new liberal tendencies

In most respects Bosanquet is a faithful disciple of Green, and this applies to political philosophy. But three thematic differences—differences in emphasis rather than sharp divergences of principle—point their political theories in somewhat different directions.

The stress on individual rights

The first has been emphasized throughout this chapter: Green makes much more of individuals as self-conscious pursuers of their perfection, and puts somewhat less weight on institutions as weaving an only partially conscious unity. Let me stress once again that is a matter of emphasis; Green too believes that the State is a 'society of societies', and that its main task is to adjust the various claims of the societies to produce 'harmonious social relations' ([14.5], 110, 112). But Green's account quickly focuses on the State as 'an institution in which all rights are harmoniously maintained' ([14.5]:130). Because the self-conscious pursuit of individual perfection looms so large in Green's work, he gives more prominence to a theory of individual rights, reinforcing the view that he is a more devoted liberal. But we need to be cautious here, for Green's conception of individual rights is not particularly close to those prominent in contemporary political theory. For him 'A right is a power claimed and recognized as contributory to a common good' ([14.5], 79).[32] Today readers are apt to think of rights along the lines suggested by Ronald Dworkin, as claims that protect individuals by trumping society's collective goals ([14.28], xi). Green seems to have precisely the opposite view: 'a right against society, as such, is impossible' (no). The core supposition of the Dworkinian theory of rights—that the social and individual good regularly conflict—is precisely the view that Green (and Bosanquet) reject. 'The principle which it is here sought to maintain is that the perfection of human character—a perfection of individuals which is also that of society, and of society which is also that of individuals—is for man the only object of absolute or intrinsic value' (Green [14.1], 266–7).

The criticism of actual States

A State that is to harmonize individual rights must ensure that the structure of rights is such that all are able to contribute to the common good. Now, and here Bosanquet explicitly disagrees ([14.14], ix, 269–70), Green believed that in the States of his time the lower classes were effectively precluded from participating in the common good. The idea of civil society as 'founded on the idea of there being a common good' is, he insists, unrealized 'in relation to the less favoured members of society'; indeed social life is a 'war' ([14.1], 263). Consequently, those at the bottom of the economic order have inadequate opportunity for self-development. Even more fundamentally, Green indicates that class differences themselves prevent common understanding in society ([14.2], 42). For Green, then, the actual States of his era do not adequately articulate the idea of the State as rationalizer (i.e., harmonizer) of rights; of the most defective instances, such as Imperial Russia, he says that we count them as States 'only by a sort of courtesy' ([14.5], 103). This drives Green to a more reformist position than we find in Bosanquet's *political* philosophy.

Consciousness of the common good

Our inability adequately to grasp the common good is not a dominant theme of Green, unlike Bosanquet, and this, of course, opens up more possibilities for State action. To be sure, Green insists that the law cannot make a person moral:

> that the law cannot make men good—that its business is to set them free to make themselves good—I quite agree. The question is, how these truisms are to be applied. I am no advocate of beneficent despotism. No tendency, inconsistent with the recognised principles of English legislation, lurks under my use of the phrases 'constructive Liberals' or 'organic reforms'…. As instances of what I mean by 'organic social reforms' I should specify compulsory education, restraint on the power of settling real estate and on freedom of contract in certain respects, specially in respect of Game, between Landlord and Tenant, the inspection of dwelling houses, [and] the compulsory provision of them in some cases.
>
> ([14.5], 345n.)[33]

So Green's 'constructive' programme was by no means radical; and he certainly was no socialist ([14.5], 163–78, 313–17). As is well known, both Green and Bosanquet stress that self-development requires private property rights.[34] Still, Green can soundly claim the title of 'constructive Liberal' as he allows that the State, and especially local government, can have sufficient insight into the common good to justify political reforms (cf. Harris [14.35]). This is the aspect of Green's political theory upon which Hobhouse builds; Hobhouse insists that the State does have the capacity to regulate public life for the better pursuit of the common good.[35] Again, whereas Bosanquet is apt to stress the unconscious nature of the general will, Green consistently gives a greater role to the

conscious apprehension of perfection.

CONCLUSION

Bosanquet developed and systematized Green's idealism (Nicholson [14.45], 4). But development and systematization do not mean that he merely repeats what Green says at greater length. Bosanquet carries the principle of coherence and unity further, explaining social unity without appeal to a primary social interest. Moreover, his theory of appercipient mass provides a psychological interpretation of social unity and the general will far more sophisticated than anything we find in Green. Yet it was the theory of appercipient mass and his relentless pursuit of the idealist theme of coherence that yielded his thin account of selfhood. Green is not, as many have said, a Kantian, but his Absolute idealism is not as developed as Bosanquet's; it is perhaps for this very reason that Green has a thicker account of selfhood. It is this difference, rather than ones in their political philosophies or actual political proposals, that grounds the intuition that Green has a stronger claim to a place in the liberal pantheon.

NOTES

This chapter was written during my tenure as a Visiting Scholar at the Social Philosophy and Policy Center at Bowling Green State University. My thanks to the Center for its generous support. I would also like to express my gratitude to Sharon Hayes: I have greatly benefited from her work on T.H.Green. My thanks also to Sterling Burnett and Ken Cust for their research assistance.

1 A second edition of *Ethical Studies* was published after Bradley's death.
2 See further Richter [14.51].
3 For helpful accounts of Bosanquet's relation to the 'new liberals', see Collini [14.24], Clarke [14.23], Freeden [14.29], Gaus [14.31], Vincent and Plant [14.58].
4 For a useful overview of Bosanquet's logic, see Passmore ([14.48], 86–7).
5 If knowledge is justified true belief, it may be argued that a coherence theory of knowledge implies a coherence theory of truth. For a development of this suggestion, see Davidson [14.27]. If one finds this terminology confusing, one can substitute 'coherence theory of justified belief' for 'coherence theory of knowledge' in what follows.
6 Richard Rorty ([14.53], 299) holds that this was the great mistake of idealism. Having rejected a representational account of knowledge, the idealists still wanted to say that in some sense our understanding of nature was true to nature's understanding of herself, that we were justified in believing not only what coheres with our concepts but that this reveals what is *true*, i.e. what nature is *really* like.
7 See also Quinton [14.50]; Crossley [14.26], Thomas ([14.56], 141–5). Cf. Milne [14.40], chapter V.
8 Cf. John Morrow's claim [14.42] that whereas Green's metaphysics is 'immanentist', Bosanquet's is 'transcendentist'. See also Geoffrey Thomas's argument that Green's theory is a 'personal' idealism, to be contrasted to the social idealism of Bosanquet and Bradley ([14.56], 142).

9 Precisely in what sense the Absolute is ‘composed’ of finite minds, and whether we can be said to be ‘members’ of it is problematic. See Bosanquet ([14.16], 98ff.). But note his remark that ‘the Absolute needs us and our conduct just as we need it’ (222).
10 Admittedly, this judgement of plausibility depends on a certain religious disposition, at which we are apt to smile today. But those smiles fade a bit when we contemplate Rorty’s diagnosis [14.53] of *our* epistemological theories about how we know nature as it really is.
11 Consequently, if as Thomas argues (and I believe he is right), Green’s ethics does not *require* ‘the full-blown metaphysics’ ([14.56, 150), it still may be the case that the ethics derives justification from the rest of the system.
12 Bosanquet is referring here to both individuality and originality. I have elsewhere argued that Bosanquet’s contrast between his view and J.S.Mill’s is overdrawn. See Gaus ([14.31], 15ff.).
13 For an excellent account of Green’s criticism of Hume’s theory of the self, see Thomas ([14.56], 173ff.).
14 For one of the best accounts of Bosanquet’s theory of the appercipient mass, see Chapman ([14.22], 128ff.).
15 Bosanquet speaks here of ‘mind’.
16 ‘The consciousness in a particular human self of the identity of its own experiences is merely, as I understand the argument, a case of apprehension of the whole’ (Bosanquet [14.16], 155). Understood as a gloss on Bosanquet’s argument, this seems correct; what is somewhat surprising is that the ‘argument’ referred to here is Green’s, which Bosanquet is intending to explicate.
17 This is an abbreviated account; see Gaus ([14.31], chapters 1 and 2).
18 For this last, see Bosanquet ([14.14], x; [14.13], 219).
19 See his discussion of the aphorism: ‘We are not hard enough on stupidity’ ([14.13], 213).
20 These are essentially the same. As Bosanquet remarks, ‘Value is the power to satisfy’ ([14.15], 297).
21 David L.Norton ([14.47], 54–5) disputes this concerning Green. I criticize Norton’s interpretation in Gaus [14.31], 20–2.
22 Bosanquet, indeed, makes so much of the way in which the mind is a product of nature he sometimes gives the impression of being more a materialist than an idealist. See Passmore ([14.48], 88–9).
23 Though, oddly enough, their positions are reversed when analysing the state; Green insists that actual states are further from the ideal. See pp. 429–31 above.
24 As Thomas points out ([14.56], 221), this view has certain similarities to Derek Parfit’s.
25 H.A.Prichard ([14.49], 73) argued that Green too denied the distinction between persons. For a criticism of Prichard, see Gaus ([14.31], 61–4), Nicholson ([14.45], 64ff.).
26 For an excellent account of Green’s theory of the common good, see Nicholson ([14.45], 54–82.
27 Cf. Bosanquet’s insistence that ‘Nevertheless, upon a scrutiny of the true operative nature of social unity, we find that repetition and similarity are but superficial characteristics of it. What holds society together, we find, are correlative differences; the relation which expresses itself on a large scale in Aristotle’s axiom “No State can be composed of similars”’ ([14.16], 249). See Bosanquet’s distinction between an association and an organization ([14.14], chapter VII; [14.16], 261).
28 For an unusually thorough and judicious account of Bosanquet’s theory of the general will, and the place of his doctrine of the real will in it, see Nicholson ([14.45], 189–230).
29 In this chapter I have not examined the theory of positive freedom. Compared to other

aspects of British idealism, this has received extensive treatment. The best account of Green's theory of freedom is Nicholson ([14.45], 116–31). See also Weinstein [14.59]; Simhony [14.55], Norman ([14.46], 26–53), Milne ([14.41], 146ff.); Roberts [14.52].

30 Again, care is called for here. Bosanquet considered himself a radical, and was prepared to accept social legislation to alleviate evils. (Muirhead [14.44], 48, 134).

31 Not that Bosanquet disagrees ([14.12], 274).

32 On Green's theory of rights, see Cacoullos [14.21], Nicholson ([14.45], 83–95).

33 Letter to W.V.Harcourt, 1973, quoted in Harris and Morrow's notes to Green's 'Liberal Legislation and Freedom of Contract' [14.5]. See also Nicholson ([14.45], 159).

34 See Green ([14.1], 201; [14.5], 163ff.), Bosanquet ([14.14], 281–2; [14.17], 308–18). This has led to Marxist-inspired criticisms of Green, such as Green-garten [14.34]. For a discussion, see Morrow [14.42].

35 For the importance of this theme in the development of the 'new liberalism', see Gaus ([14.32], 21–3). Collini doubts whether Green's idealism actually strongly supported new liberal collectivism ([14.24], 44–6).

BIBLIOGRAPHY

Works by Green

A good bibliography of works relating to Green’s moral theory can be found in Thomas [14.56] and concerning Green’s political theory in [14.5]; see also the bibliography in Vincent [14.57]. Nicholson [14.45] and Vincent and Plant [14.58] contain useful bibliographies of works relating to British idealism, including both Green and Bosanquet.

CHAPTER 15
Bradley

T.L.S.Sprigge

INTRODUCTORY

F.H.Bradley (1846–1924) was a fellow of Merton College, Oxford, for all his adult life. Though his personality and life are interesting, information about them is not required for an understanding of his philosophy. Suffice it to say that he was widely acknowledged as the most important British philosopher of his time.

His thought represents the climax of the late nineteenth-century reaction in Britain against British empiricism and utilitarianism, and turning towards the great German masters, Kant and more especially Hegel. Bradley's pages are shot through with negative remarks on this tradition, exhibiting a particular hostility to J.S.Mill, contrasting here with the much more balanced criticisms in the work of such other main figures of the absolute idealist reaction against it as T.H.Green (1836–82) and Bernard Bosanquet (1848–1923). Yet Bradley, despite himself, often develops his idealism in ways closer to the British empiricist tradition than do these other thinkers. This was, indeed, a point made against some of his work by Bernard Bosanquet, who mostly held very similar views.

Apart from a number of articles on introspective psychology (included in *Collected Essays*, 1935, posthumously published) Bradley's main works are *Ethical Studies* (1876; second edition 1927, [15.4]); *The Principles of Logic* 1883; second edition 1922, [15.3]); *Appearance and Reality: A Metaphysical Essay* (1893; second edition 1897, [15.1]). In each case the second edition includes important new material. We will give some account of each of these works, respectively on ethics, logic and metaphysics. References will also be made to the important late collection of essays, reprinted from journals, called *Essays in Truth and Reality* (1914, [15.2]).

ETHICAL STUDIES

In *Ethical Studies*, his first major work, Bradley speaks as one bringing to a benightedly provincial 'England' the news of a philosophy from overseas possessing a depth of insight largely unfamiliar to his compatriots.

The work is concerned with what it is to be moral and with the character of the ordinary man's moral consciousness. Sometimes Bradley implies that his is only a phenomenological clarification of how ordinary decent people, rightly or wrongly, think and feel. However, he clearly supports the ordinary man against what he considers the distorted accounts of morality of many philosophers. (Bradley, of course, uses 'man' for

'person' like most writers of his time. It seems better, in this exposition of his thought, to follow him here than give him an air of false up-to-date-ness by employing a less sexist terminology.)

The first chapter concerns moral responsibility and free will. Philosophers are divided into two main schools, determinists or necessitarians and free-will-ists. Neither makes sense of the notion of moral responsibility. If it was settled by the causal process of the world, even before I was born, what kind of man I was to be and how I would act, how can I ever be blamed for anything I do? Equally, if what I do is due in part to the exercise of a contra-causal free will, this seems no more than the intervention of sheer chance into the procession of phenomena. I can hardly be held responsible for doing things where there is no explanation of the fact that I acted thus.

Each theory, thinks Bradley, trades on the defects of the other, as the wrongly supposed only alternative to it. (In his treatment of the law of excluded middle in *Principles of Logic* he points out how easy it is to say '*P* or not-*P*', where not-*P*, *as it is being understood*, is not the only alternative to *P*.)

To resolve matters Bradley considers how the ordinary man would react to precise predictions of his own behaviour in some important, situations. He would certainly dislike the idea that some super-scientist might have been able to predict, on the basis of general laws, perhaps in advance of his birth or emergence from infancy, just how he would behave. But he does not dislike the fact that a friend, knowing his character, correctly predicts that he would behave well in an emergency. (And, if his friend predicts correctly that he would behave badly, it is the fact that he is a bad man, and that his friend knows it, which disturbs him, not the fact of prediction as such.) Indeed, the good man would be offended if the decency of his behaviour could not be predicted.

The fact is, argues Bradley, that we do not mind prediction which is based on a knowledge of oneself as a unitary personality. What one objects to is the idea that there could be predictions in which one's own self seems to be bypassed, because appeal is made to general laws of nature, whether physical or distinctively psychological, (for example, laws of the association of ideas or, in our own day, reinforcement theory of a Skinnerian type) couched in impersonal terms which take no account of one's individuality.

Bradley interprets this as showing that the ordinary man conceives himself as what, in the technical language of Hegelian philosophy, may be called a concrete universal. His behaviour, in so far as it really springs from him, is a manifestation of how that universal manifests itself in that particular situation. Increasing familiarity with the character of that universal which constitutes another's self will increase my power to predict his behaviour, but I will not be doing so on the basis of laws which apply to other people, still less to inanimate nature. That, at least, is the opinion of the ordinary man, and Bradley evidently endorses it.

We must pause for some explanation of the concept of a concrete universal, developed by Bradley, Bosanquet and others under the stimulus of Hegel.

An abstract universal is some common feature humans have found in many different things. It is abstract because this common feature is not an independent reality which could exist on its own and because, as an abstraction, it plays no real role in explaining why the things which exemplify it are as they are. You do not explain why a box is of the

shape it is simply by pointing out that one can apply the general idea *cube* to it. If the idea of a human being is simply that of an abstract universal, then you cannot really explain anything about an individual human being by reference to it, for it is simply a non-explanatory registration of similarities. Moreover, the thin idea of what a human being is which we reach by dropping everything which individuates one person from another is far from that full idea (whose object is a concrete universal) of what it is to be a human which involves grasping something of the rich and varied potentialities there are in human nature.

A concrete universal is, like an abstract universal, something identically one and the same in a whole lot of particular things or events. But it is such that the specific nature of these things or events is just what it needs to be if the universal is to insert itself into history at that point. Moreover, to conceive a universal as concrete is to grasp something of the rich variety of its possible instances.

The thesis is not really that some universals are abstract, others concrete, but rather that the idea of abstract universals belongs to an inadequate view of the world better replaced by that of concrete universals.

The notion of a concrete universal (so we may feel) possesses rather an excess of 'open texture' so that its use is extended from time to time in ways which suit an author's present enthusiasms. Thus there is a concrete universal where many individuals with a common characteristic (of some complexity, usually) each owe their possession of it, and what is more their possession of some specific determination of it, to their relation to another of its instances. Humanity is a concrete universal because we are each human through being born of humans and owe our particular form of humanity to them in both physical and environmental ways. (A Martian with no blood relationship to us—even if anatomically akin to us—would not be an instance of the same concrete universal.)

On the face of it, humanity conceived in this way as a concrete universal is not a totality made up of human beings but an identical characteristic present in each of us, in a distinctive form, in virtue of the causal relations between its instances. However, proponents of the concrete universal usually take the totality of its instances as itself the universal in question, arguing that it is a kind of whole which is present in each of its parts. Maybe an insistence on such distinctions is an attempt to transform the notion of a concrete universal into something belonging to another conceptual scheme, and we should learn how to play the relevant conceptual tune rather by ear than by analysis.

At any rate for Bradley's plain man the self is a concrete universal and a man is responsible for what he does in so far as his behaviour is a manifestation (however regrettable a one) of that universal which he is. As for why that particular concrete universal has emerged in connection with that particular human organism, we cannot pursue Bradley's not very decisive answer here beyond remarking that it is built up gradually in childhood by the creative response of itself in an undeveloped version to the challenges of life as they occur.

We can now move on to the key questions of the book. Firstly, why should I be moral? Secondly, what is it to be moral?

Firstly, insists Bradley, it would betray morality to suppose that there was some extrinsic reason for being moral. However, we can give sense to the question if we realize that all action is ultimately motivated by an urge to self-realization and that we can

properly ask whether moral behaviour is an adequate form of self-realization or is even perhaps identical therewith.

Self-realization is another difficult concept. Put at its most metaphysical, it is the urge of the concrete universal, which is one's self, to be exemplified in as full and rich a fashion as possible in each of its particulars, i.e. each particular psychological state one lives through, and each action one performs. More informally, it is the urge to live so that one can feel as much as possible in everything that one does that one is really being oneself in doing it, hence living in a way such that one can be satisfied with the image of oneself as so living.

Secondly, granted there is good cause to be moral, doing so must realize the self. But what is it to be moral? Bradley now examines a series of representative answers to this question, and tests their adequacy by the test of the extent to which they show how moral life is a form of (or perhaps the same as) self-realization.

The first answer he considers is hedonism: the good life is one in the course of which one achieves as much pleasure as possible (understand henceforth: and minimum of pain, however these two are balanced).

Bradley has a series of objections to this as a human ideal; some deeply metaphysical, some more matter of fact.

(1) *(a)* Whatever amount of pleasure I achieve in any situation, a bit more, not too painful effort, could have brought me more; so I can never achieve the end of the maximization of pleasure, *(b)* Or, looked at in another way, whatever amount of pleasure I achieve, I could never have achieved more, for I always did what so far as my insight went (something I cannot determine for myself) would maximize my pleasure. (Bradley assumes that the hedonist's conception of the good life is derived from a hedonistic account of actual motivation.)

(2) I can never say to myself I *have now achieved the maximum of pleasure in my life*, for my success in this is not settled till I die and then I am no longer here to be gratified at my success.

(3) The self as an abiding entity rather than a mere flux wants an abiding satisfaction, a state in which it can say *here am I presently in achievement of my goal*. It is not, of course, that it wants a goal such that, having once reached it, it can simply halt there for ever without further effort, but it does want a state in which it can say *here I am presently in possession of what I looked for, and if am careful, can continue in its enjoyment throughout my life*. But a series of passing pleasures can never constitute such a satisfying state.

Moreover, the concrete universal, which is the self, feels itself to be in some sense *an infinite whole*, not in what Hegel called the bad sense of 'infinite', namely an uncompletable series, but in the sense of something which has a certain sort of completeness from which nothing is missing. (Hegelians would surely have thought the Einsteinian universe infinite in a good sense in contrast to the bad infinite of a Newtonian or Democritean space which stretches on indefinitely.)

But surely the relevant form of hedonism for discussion in the nineteenth century is utilitarianism, in particular as advocated by J.S.Mill, and it is this which is really the object of Bradley's attack.[1] Here, of course, the goal is the maximization of the pleasure (understand: and minimization of the pain) of all sentient creatures. And surely this is a

genuinely moral goal.

But it was worth examining the simpler egoistic form of hedonism, thinks Bradley, for we there find in a simpler form the faults which are, for the most part, still present writ large in utilitarianism with its goal of the maximization of the pleasure of sentients.

(1) *(a)* Whatever we do we could have produced more pleasure for ourselves and others. (There seems nothing corresponding to *(b)*.
(2) Much the same applies.
(3) If the maximization of pleasure provides no adequate satisfaction for the individual, we should not foist it on the human race, or the animal realm.

Finally, utilitarianism has the peculiar fault of trying to derive its universalistic ethic from a an egoistic hedonistic psychology. But this is a complete *non sequitur*. Because each man desires his own maximal pleasure, and thus finds it good, he should recognize (so Mill seems to argue in chapter IV of *Utilitarianism*) that the maximal pleasure of all is the good of all, and that each should therefore desire this. But this is like arguing that since every pig at a trough 'desires his own food, and somehow as a consequence seems to desire the food of all' that 'by parity of reasoning it should follow that each pig desiring his own pleasure, desires also the pleasure of all' ([15.4], 113).

The main argument against hedonism, whether individualist or universalist, is that trying to maximize pleasures is no proper end for man since no self can find itself realized in having maximized pleasure either for itself or for others. For the pleasures of different times form no real totality, since they never exist together, and can never constitute a state of affairs of which we can say: 'Here I have that which I was seeking.'

Bradley now turns to the sharply opposed moral theory of Kant. This he calls the ideal of duty for duty's sake. Here the good is identified with sheer rationality, in fact, simply with living a life which exemplifies the law of non-contradiction. One is to behave only in a way which one could will universalized without contradiction.

This marks an advance on pleasure for pleasure's sake in its emphasis on the contrast between two aspects of the human being, the good self and the bad self, and the identification of morality with control of the latter by the former. It also rightly conceives the self as a universal rather than as a series of 'perishing particulars'. But it is only an abstract universal with a purely formal purpose, to live without self-contradiction, and this can give no real satisfaction; for our sensuous selves do not enter into the self-realization of the universal but simply remain in sulky opposition to it. Moreover, the injunction to live without self-contradiction is really quite empty and either allows or forbids everything equally. One should keep a promise because promise-breaking universalized would destroy the very institution on which it depends. But so equally would universal charity towards the poor, for it would leave no poverty to be alleviated.

The inadequacies of pleasure for pleasure's sake and of duty for duty's sake show the need for a concept of morality which will provide unitary satisfaction both to sensuous appetite, that is to our nature as a series of particular desires, and to reason, the universal aspect of the personality.

This is provided by the Hegelian notion of morality which Bradley calls the ethic of 'my station and its duties'. Here the community plays the role of concrete universal with individual people as its instances realizing themselves as such. Because the community is

historical and concrete, the requirements it puts upon the individual are determined not by some remote logical abstraction with no appeal for flesh and blood but by the needs of a role in the world which provide a satisfying life for the real empirical man. The good self is no longer depicted as at war with the natural man, while the bad self is simply such propensities as need control if one is to enjoy the satisfactions proper to a social being.

Bradley speaks rhapsodically (to a degree for which he himself apologizes) in favour of this social ethic. But in the end he admits that it is not the whole truth. For this there are a number of reasons.

The great recommendation of my station and its duties is that it achieves a reconciliation of the *ought* and the *is*. That is, the *ought* no longer comes as a demand from some other world in which the I of this world can find no satisfaction but as a demand from precisely that in this world which can most satisfy. However, even this ethic does not quite live up to its pretensions.

(1) My community may not be adequate even for my good self, let alone for my bad self. For *(a)* It may be itself in a rotten state and my goodness may involve recognizing this, *(b)* Even the best community cannot be morally adequate throughout, (c) There are miseries no absorption in my community can stem, *(d)* My community may demand sacrifices frustrating self-realization. In short, self-realization in the faithful carrying out of my station and its duties cannot be complete.

(2) Since society is in progress, there is always some call to criticize the demands and practices of one's own community by reference to some more ultimate human ideal which one dimly feels in contrast to it.

(3) My station and its duties cannot be the whole good for man. There are values which may take us beyond social life in our community for example the development of our artistic and intellectual powers.

These limitations push us on to what Bradley calls ideal morality. The basic injunction here is to realize everywhere the best self, and our idea of our best self, though it must arise from the ideals we learn in the family and in life in the community, may develop beyond it to take account of values learnt from other societies or based on internal criticisms of our own society.

The good self as thus conceived has these main aspects:

1 The ideal self of my currently socially recognized stations and its duties;
2 A social self which goes beyond this and which divides into *(a)* a social self going beyond, or divergent from, my currently recognized station and its duties and *(b)* a non-social self devoted to such ideals as the fullest possible realization through my activity of truth and beauty.

So is morality simply the same as self-realization? No, it is self-realization in respect of our will. External results are not part of morality. Of course, a will which does not express itself in genuine action is nothing, but success or failure as determined by forces outside us may help or hinder our self-realization but not that aspect of it which belongs to morality. Morality is 'the realization of the self as the good will'.

This good self is especially concerned with more or less permanent objects with which it identifies itself, in whose presence or known flourishing it finds itself affirmed—such as my family, my Church, my nation, some great social or cultural enterprise. Such felt

self-affirmation in such things is neither natural appetite (the satisfaction of passing bodily needs) nor lust (craving for savoured pleasures).

How can I come to concern myself with anything other than the satisfaction of my own appetites? My ability to do so originates in my identification in childhood with my mother or nurse (or whoever plays these roles). Unwelcome as some of their demands may be, I feel their will not as something alien but as pertaining to my own more stable self. Thus the good self originates as obedience to dear ones in whose satisfaction I feel myself affirmed, develops, as the ideal of conduct thus set before me, matures through the expectations of society and my own criticism of these in the light of the ideal's own promptings, and may continue into self-affirmation through the knowledge that an impersonal goal is being reached, perhaps quite remote from my own private interests.

But what is the origin of the bad self? (For we are born neither good nor bad.) Its material is simply the variety of impulses, appetites and moods which do not fit in with the good self approved by our loved ones. However, you are neither good nor bad till you know both and experience their contradiction. And you can know both only because you feel genuinely affirmed in both. Only the person who knows evil can be good, and only the person who wills evil can know it. But you must not only know both but know their clash, as a universal whose self-consciousness lies in its ability to separate itself from both and choose (but not by indeterministic free will).

As one becomes a genuine moral agent the chaos of impulses opposed to the unified good self becomes a bad self with its own unity (though what unifies them is solely their common negation of the good). Moral responsibility arises when there is both a good self and a bad self in which one can consciously affirm oneself.

And now the final question is broached: Why can I realize myself only properly in the good self, granted I feel myself genuinely affirmed in both good and evil?

The self, being a universal, realizes itself in the good self which is a genuine system or universal. The bad self stands in opposition to this with no principle of unity organizing it except that negative property of being opposed to the good self. Thus the bad self is a mere collection (like the only self acknowledged by pleasure for pleasure's sake) and thus the ultimate self, which is a concrete universal, cannot realize itself therein, and, when it tries to do so, is false to its very essence.

The book ends with 'Concluding Remarks' on the relation between morality and religion. Religion is not the same as morality. Matthew Arnold wrote mere claptrap when he said that religion was morality tinted with emotion—for the emotion has to be religious.

The distinction between morality and religion is that religion asserts that the good self is not merely something we should strive to realize but that somehow the good self alone is ultimately real, is indeed identical with God or the fundamental reality of the universe, while the bad self is somehow unreal and, just for that reason, must be suppressed. And because only the good is ultimately real, the often despairing struggles of morality give way to the calm activity of faith.

Bradley here broaches the absolute idealism he will develop more fully in later works for which we are all aspects of a unitary spiritual Absolute.

> If we know the whole, it can only be because the whole knows itself in us,

> because the whole is self or mind, which is and knows, knows and is, the identity and correlation of subject and object.
>
> ([15.4], 324n.)

This idealism is here treated as the essential truth of Christianity. Later Bradley no longer conceives his metaphysical idealism as so close to Christianity, and at times speaks of the Christian religion in a distinctly negative way. This was doubtless partly the result of a change in his metaphysics, but it was probably more due to his increasing sense that Christian tradition, by its emphasis on preparation for a hereafter, detracted from concern with the possibilities of human fulfilment in the present life. (Bradley thought the question of a life after death was of very secondary importance ethically; a bare possibility with little bearing on what really matters, the realization of eternal values, grounded in the Absolute, in our daily life and in society.)

Religion thus interpreted resolves the contradiction endemic to ethics conceived without it. For, so Bradley rather puzzlingly holds, there is something incoherent in the very idea of a good which is not realized. One is inclined to object that there is no incoherence in the proposition that things are not as they ought to be. In *Appearance and Reality* Bradley does, indeed, say that one cannot simply take it for granted that the non-contradictory nature of the real precludes it from being overall and ultimately bad, but, by rather tortuous reasoning, he does in the end reach this conclusion, and seems always to have found it inviting and natural (see [15.1], 132–3). Thus he seems always to have inclined to see a clash between ideals and sense of fact as a source of unease essentially akin to that which we feel in embracing a logical contradiction and which we have the same necessary nisus to remove, not only in practice but in our conception of how things are.

In spite of the Christian language invoked in this rather passionately written chapter, Bradley already distances himself from any commitment to Christian sacraments as anything other than optional aids to morality and spirituality. ‘We maintain that neither church-going, meditation, nor prayer, except so far as it reacts on practice and subserves that, is religious at all’ ([15.4], 337). In fact, ‘[y]ou can have true religion without sacraments or public worship, and again both without clergymen’ ([15.4], 339).

The object of true Christian faith, then, is a universal will, present as identically the same, though in a state of difference from itself, both in the individual and in the community and, indeed, in the world as a whole and such that all that appears to conflict with it is an unreality which we must grasp as such by overcoming it.

There is some kinship here with the religion of mankind promoted at that time by the Comtian positivists. However no such deification of mankind will do so long as humanity is supposed a mere collection of resembling particulars, rather than as a genuine concrete universal identically yet differently present in us all. ‘Unless there is a real identity in men, the Inasmuch as ye did it to the least of these’ becomes an absurdity’ (original note 2 to [15.4] 334–5). In stressing the common essence present in us all, Bradley’s position chimes in somewhat with the ethical thought of Schopenhauer. But, from his more Hegelian perspective, he must have thought that Schopenhauer paid insufficient attention to the difference which is essential to the identity. We must have a sense of the different roles we each have to play in the scheme of things. For the concrete universal of humanity

at large is articulated into a system of distinct roles, each grounding partly different duties, as well as those which spring from the sheer identity of the common essence. Moreover, from a religious point of view, it is the ideal self, rather than one's whole chaotic personality, which is identical with the ultimate single reality present in all things. If there is some incoherence in looking at things in this way, that is, none the less, the religious way of experiencing the world ([15.4], 322). Metaphysically, this presumably means that it is only our ideal self which gives us a clue as to how things would look if we could see them as a whole.

THE PRINCIPLES OF LOGIC

In *The Principles of Logic* Bradley presents an account of judgement, that is, of what it is to think that something is the case, and a principle of inference, of what it is to move rationally from one judgement to another.

Like *Ethical Studies* much of it is concerned to present an account of these matters which will serve as a corrective to the indigenous empiricist tradition. Yet the work is less Hegelian than the previous one, and (though Bradley was scarcely aware of this) much nearer to his empiricist forebears. He does, however, draw on a range of German thinkers not very familiar, probably, to most British readers.

The biggest contrast with empiricism is Bradley's continued insistence on the reality of universals (*qua* concrete) and the inadequacy of the concept of mere resemblance between particulars to explain that real identity-in-difference between them which is the basis of predication and of inference. A related theme is the unsatisfactory nature of purely psychological accounts of thought and reasoning.

Bradley is sometimes praised, in this connection, as an early opponent of psychologism, that is, of the treatment of judgement, inference, truth, meaning, the laws of logic and so forth as psychological processes to be studied empirically. Gottlob Frege is regarded as the great saviour of modern thought from the errors of such psychologism, and there is a risk that people may suppose that the main merit of *Principles of Logic* is that of a less lucid attack upon the same thing.

That Bradley was in important respects a critic of psychologism is true. Thus he expressly says that in 'England at all events we have lived too long in the psychological attitude' (see [15.3], 2; 197–9). He believed that the empiricist treatment of thought by James Mill, Bain, J.S.Mill, and others was wrongheaded in treating it as a mere succession of empirical events. None the less, for him (as for Edmund Husserl) judgement and inference were activities of conscious minds, though logic is concerned rather with their assertive content and validity than with their empirical occurrence.

Bradley begins his account of judgement by criticizing a number of theories including most of the typically empiricist views. Thus he objects to the Lockean view that judgement is the joining of ideas, on the ground that if all the mind does is join its own ideas it could not think about anything beyond them. The theory also mistakenly assumes that judgement always involves two ideas. This it clearly does not, for example when it simply affirms the existence of something. It is truer to say that there is always just one idea, our total idea of the state of affairs we believe to be real.

Hume thought that belief consisted in vivacious ideas, but such an account is patently inadequate. Imagination, even when recognized by itself as such, can be very vivacious. In general, empiricists, like Berkeley and Hume, identify judgement with the formation of images, failing to explain what it is for the mind to take these images as representations of something beyond.

After criticizing various inadequate views of judgement Bradley moves towards his own account of judgement as the abstraction of a universal (or concept) from the sensory flux of its own contents and ascription of this universal to reality as that exists beyond one's own private experience in a manner inexplicable as any mere manipulation of my own images.

Bradley develops this view by insisting that we distinguish a psychological and a logical sense of the word 'idea'. Ideas in the first sense are unrepeatable events in time; ideas in the second sense are concepts or meanings which can be embodied in successive ideas in the psychological sense but to which much of their character as mental phenomena is irrelevant.

The importance of Bradley's distinction between these two senses of 'idea' has been widely recognized. More likely to be questioned is his particular view about the nature of the logical idea as a repeatable character or universal which is an *abstracted part* of the total character or *whatness* of the mental ideas which embody it, applied as a predicate to a reality beyond itself.

It will be seen that Bradley was really at one with the empiricist tradition in holding that the fullest sort of judgement involves imagery. (He always regarded merely verbal judgements as secondary to ones carried by thought stuff with more sensuous fullness.) The difference, as he saw it, was that he conceives the mind as actively utilizing a repeatable part of the character of the imagery to characterize a world beyond its own ideas. For surely we could not refer our ideas to a reality beyond the contents of our own consciousness if we had no awareness of that reality except through our ideas of it. Conceptual thought presupposes non-conceptual awareness of something other than concepts. Unless we encounter something other than concepts we cannot think of our concepts as applying to anything (see [15.3], 50).

This pre-conceptual awareness cannot be directed on any particular finite reality since, as Bradley sees it, we need concepts to distinguish any distinct part or feature of reality from others. So the pre-conceptual basis of judgement must be a primordial direction of the mind on reality at large, this being the ultimate subject to which all ideas are ascribed as predicates. Certainly, with the aid of our ideas, we can pick out a particular part or feature of reality as the subject of our thought, but as picked out by ideas it belongs strictly to the predicate rather than the subject of judgement. Bradley spoke in his later work on thought of a special subject of judgement, chosen by our ideas as that which is to be characterized more specifically, but the ultimate subject remains reality at large.

But how does the mind manage to direct itself upon a reality not constituted by ideas? It does so because it is intrinsically continuous with, indeed somehow identical with, a larger reality beyond itself and it feels itself as being such. This is not an opinion in the sense of a judgement using ideas or concepts but the necessary pre-conceptual background of conceptual thinking.

Thus at the root of thought is a feeling of continuity with a larger whole of which our

present state of mind is just a fragment. Our thoughts are an effort to apply ideas to this whole which will carry us beyond this mere dumb acquaintance. (At the level of ordinary thought and experience this larger whole presents itself to us spatio-temporally as a physical world. As metaphysicians, or in moments of illumination, we may become aware of it in a manner which leads to a more spiritual characterization of its nature.)

Bradley says in his initial statements that it is the reality presented in the perceptual manifold, as experienced immediately quite apart from any ideas we form of it, which is the subject of which we predicate our ideas. But, as he makes clearer in the second edition, it is not presented only by the perceptually given but by anything else thus directly presented or experienced.

There are intriguing similarities and contrasts in Bradley's position here and that of Bertrand Russell, who was influenced by Bradley in his own treatment of definite descriptions (talking of the King of France where Bradley talks of the King of Utopia) as belonging logically to the predicate (and in his related account of existential statements). For Russell propositions which can be grasped without acquaintance with the particulars with which they are ostensibly concerned are parasitic upon propositions about particulars which can be grasped only by those acquainted with them. Bradley is even more insistent that a kind of acquaintance, which goes beyond its specification in terms of universals, is required if we are to think of something. But for him the reality with which we have this pre-conceptual acquaintance is always the same, namely the one sensible reality which we encounter non-conceptually through sense experience. Not that the thought had failed to occur to him that we may have a pre-conceptual encounter with particular bits of reality, which we can refer to by such words as 'this' and 'here'; indeed he makes suggestions in this connection which may well have influenced Russell. But, although thinking of our ability to locate particular bits of reality by our direct pre-conceptual awareness of them is quite useful at a rather superficial level of analysis it will not, as Bradley sees it, ultimately do. In the end it is always simply reality, *tout court*, rather than some particular bit of reality which is the subject of predication (see [15.3], 50).

This account of judgement strongly suggests the view that a judgement is true if and only if the idea (in the logical sense) which functions as its predicate is a universal actually found in the reality to which it ascribes it. For what else can we be doing in ascribing the character we abstract from our imagery to a reality beyond but supposing that it is actually found there as an actual feature of that reality? And in what other sense could our judgement be true than that it is in fact present there?

Such an account of truth is not far off from the Scholastic view that in true thinking an essence *objectively* exemplified in the mind is recognized to be the *essence formally* exemplified by that reality beyond on to which the mind is directed. And, though Bradley never presents this explicitly as his account of truth, it seems to be frequently presupposed in what he has to say as to how various different sorts of judgement must be taken if they are to give genuine truth about reality.

Admittedly such a view of truth could apply only to judgements the content of which is imaginatively realized in a fairly full manner. However, for one who thinks, as Bradley does, in effect, that other judgements are a kind of substitute for these, their truth will consist in the truth of the more imaginatively fulfilled judgements for which they

substitute.

This certainly seems to be the view of truth most obviously implied by Bradley's theory of judgement as we have so far considered it. However, while commentators usually allow that there are traces of a correspondence view of truth in the first edition of *Principles of Logic* they usually take him as having rejected this in his later writings in favour of a coherence view. Though *Appearance and Reality* is relevant here, the main sources for Bradley's supposed coherence view of truth are some of the essays collected in *Essays in Truth and Reality*, first published in 1914, consisting largely of essays published in journals (mainly *Mind*) from 1904 to 1911 (though one goes back to 1899). Of these the most important is chapter VII, 'On Truth and Coherence'. He there sets out to argue, as against expressions of the contrary view by G.F.Stout and Russell, that there are no immediately certain facts delivered to us either in perception or in memory and that every such judgement, like all other judgements, is subject to the test of includability within a total system of acceptable beliefs. This test includes not merely coherence but also comprehensiveness ([15.2], 202; 223–6).

These two requirements have, indeed, a common source, according to Bradley, for, he holds, there is always incoherence in any body of thought which stops short of the whole truth. However, in practice we have to treat them as two distinct criteria which our thought must satisfy if it is to be true. Taken together these criteria constitute the notion of membership of a judgement in a system (see [15.2], 241).

Thus if a judgement as to what I am perceiving, or a memory judgement as to what I perceived in the past, cannot fit into the main body of my knowledge (that is, my current system of beliefs) it will be quite proper for me to reject it, and put a different interpretation on my experience.

The standard criticism of coherence as a criterion of truth is that you can have a coherent system of false propositions. But when it is realized that the test was meant to be used, along with that of comprehensiveness, only on judgements which someone is inclined to affirm, the force of the criticism is largely blunted. Thus taken it bids us accept only judgements which cohere with the largest body of other beliefs which will continue to solicit us however encyclopaedic our concerns become.

The difference between Bradley's position and that of the coherence view of textbooks may go deeper still. For he sometimes says that it is not only with other judgements that a judgement must cohere to be true, but also with experience (i.e. or e.g. sense experience). Such, at least, seems to be his meaning when he says that the 'idea of system demands the inclusion of all possible material'.

It must be emphasized, in any case, that the idea that somehow thought can remove itself from its basis in experience and discover how things are in some quite *a priori* fashion is firmly rejected by Bradley (see [15.2], 203). What Bradley denies, then, is (not that our knowledge or belief system arises from experience and is continually subject to testing thereby, but) that it is based on some hard data supplied by perception which cannot be rejected. It has been observed that Bradley's view, especially as developed in this particular essay, has some affinity to currently influential views of W.V.O.Quine's.

Bradley himself was not unaware, it seems, of a conflict in his thought between a view which makes truth a feature of a system of ideas considered in its own right, and one which makes it turn on its relation to something else. For his final answer to the question

'what is truth?' (reached by the intermediate suggestion that truth is what completely satisfies the intellect) seems to be that '[t]ruth is an ideal expression of the Universe' ([15.2], 223) and this seems designed to meet this very difficulty.

Not that the answer is an easy one to grasp. What Bradley seems to mean is that the Absolute, as somehow present in all its parts, is striving within each part to develop itself into the whole, with the result that the thought pertaining to any part has an initial tendency to develop into ideas which capture something of its total character. Since the whole is coherent and comprehensive this urge takes the form of a nisus towards a coherent and comprehensive system of ideas which will reproduce the character of the Absolute to whatever extent it satisfies itself. However, the ideas do not form a completely closed-off world, for the intellectual part of reality to which they pertain is continually fed by experience stemming from the other parts.

However obscure the notion that reality is working itself out within the intellect of each of us may be, it is apparently Bradley's attempt to combine the view that truth consists in ideas which capture something of the essence of the reality of which they are predicated with the view that it consists in the satisfaction of having ideas which are coherent and comprehensive. For if the reality we are thinking about is expressing itself in the way we think of it, then our system of thoughts can best reach a correct characterization of what they are about by satisfying the internal criteria it imposes on itself.

Besides this general account of judgement Bradley provides an interesting account of the different types of judgement, categorical, hypothetical, negative and so forth. However the main topic of *Principles of Logic*, pursued in Books 2 and 3, is the nature of inference. The central thesis is that inference consists in 'ideal experiment' in the form of synthesis and analysis. Typically this consists in synthesizing the ideas we have of things into some more comprehensive idea of a whole to which they must or may belong and finding through analysis that the whole or its constituents, as thereby presented in idea, consequently possess certain characteristics, or relations to each other, which must or would belong to these as they exist in external fact. 'Reasoning thus depends on the identity of a content inside a mental experiment with that content outside' ([15.3], 436).

In his account of judgement Bradley had already insisted that to think of all judgements as subject-predicate in the Aristotelian sense was a misconception which foundered on existential and relational judgements. (Though Russell held that the Bradleyan treatment of relations depends upon that assumption, his own way out of it owes much to Bradley.) This challenge to tradition is continued in his account of inference in an elaborate critique of the doctrine that all reasoning is syllogistic. (He has received some credit for this from modern logicians who would not, however, go along with his associated view that the criteria of valid inference can never be purely formal.)

One of the main themes is the impossibility of reducing all valid inferences to the syllogistic form except perhaps by an act of torture which distorts their significance. Bradley shows carefully how various sorts of inference cannot be thus treated, in particular those which turn on the meaning of relational expressions. Thus inference cannot be reduced to the application of a limited set of standard rules nor can it become such simply by the addition of some extra rules not recognized by traditional logic. Such an aspiration turns on the wholly mistaken view that the validity of inference is

determined solely by the form and never by the content of premisses and conclusion. Such rules as there are, are only general guides not formulas to be followed mechanically (Bradley associates this with a similar point about moral rules).

There is much that is of continuing importance in Bradley's treatment of inference and of related themes, though it is often clumsy in comparison with the treatment that modern symbolism makes possible.

APPEARANCE AND REALITY

We must now turn to Bradley's metaphysical position as advanced in *Appearance and Reality* and developed further in *Essays in Truth and Reality*.

Bradley sets out in this work to show that all ordinary things are unreal, such as physical things, space, time, causation and even the self (which is treated with distinctly less respect than in *Ethical Studies*). Though unreal, however, he insists that these things can properly be said to exist.

What can be meant by saying that tables, space, time or ourselves are unreal, though they certainly exist? Bradley, it would seem, has two things in mind which he does not clearly distinguish, though he would probably say that in the end they come to the same. In the first sense, to say of certain things that they exist but are unreal is to say that, though the concept of such things, and the postulation of their existence, is an effective, indeed indispensable, tool through which thought can deal with the world, so that we must go on speaking of there being such things, there is an incoherence in our concept of them, which means that thought which postulates them cannot possess that final truth as to how things really are which metaphysics seeks.

The second sense in which he seems to think of such existing things as unreal is that though they are so to speak *there*, we conceive of them as having a degree of independent existence when they are really only abstractions from a more concrete totality. Common-sense examples of things which exist but are unreal in something like this sense might be shadows and the surfaces of three-dimensional objects and their merely two-dimensional shapes.

While we may listen patiently to an idealist who tells us that the physical world is unreal in the first sense, it is harder for him to persuade us that we, and even our passing thoughts, are so. In the latter case emphasis on the second sense of 'unreal' renders his thought more promising.

However, Bradley himself would say that in so far as a thing is a mere abstraction from some more concrete whole (of whose nature we take inadequate account) what we have in mind when we speak of it as existing is bound to be somewhat incoherent. So the second sense will be a case of the first.

Bradley marshals a large array of arguments to show that the things mentioned are unreal. Physical things are unreal, because we can form no conception of them which distinguishes between those of their 'properties' which genuinely inhere in *them* and those which are a matter of their effects on an observer. Yet the very idea of a physical thing is of something to which this distinction applies. Moreover, the space and time within which they supposedly exist are riddled with paradoxical contradictions which Bradley exhibits with glee. So whatever aspect of reality it is with which we are really

dealing when we think of the physical, it cannot in its true nature answer to properly physical predicates. We ourselves are similarly contradictory and unreal. Whatever is doing what is known as 'our' thinking cannot really be a self or person as such thought conceives it, for there are too many incoherences in the idea of a person for this to be so. (These turn particularly on the matter of personal identity over time.)

The detailed contradictions present in all our concepts are largely instances of one very basic contradiction involved in all our thought, a contradiction inherent in the very idea of a world of distinct things standing in distinct relations to each other.

We (that is eventually the Absolute masquerading as ourselves) cannot help thinking in terms of there being lots of individual things in the world. Equally, we cannot help thinking of these individual things as standing in a variety of relations to each other. But the idea of things held together by relations is radically incoherent, essential tool for dealing with the world though it is.

For if the relations between things are themselves things, then they require themselves to be related to the original things, and those relations must again be related to these relations and what they relate, and so on in an endless incoherent regress.

Should we then say that the relations are not things? But if not things, what are they? Unless something can be said about them they had better not claim to figure in any ultimately true account of the world. Perhaps then they are aspects of the things they relate. But if the relation between *A* and *B* is an aspect of either *A* or of *B,* or separately of each of them, they do nothing to connect *A* and *B*. *R* as in *A* is just there in *A,* and has nothing to do with *B.* Perhaps then they are aspects of *AB,* the unity of *A* and *B.* But if *A* and *B* are a unity to which the relation *R* belongs, then it seems it is not through *R* that they are brought together.

This is by no means an adequate account of Bradley's famous, and often correctly or incorrectly controverted, argument but gives a hint of his style of reasoning in this connection.

Some of the criticism of it certainly misses the point. It is said that Bradley thinks of relations as things, but that they are not things but how things stand to each other. But this misses the point that Bradley asks us what they can be if they are not things, and claims to dispose of them whether we conceive of them as things in any proper sense or not. But probably critics are right, that Bradley's arguments can be answered if we bring our full conceptual resources to bear on them.

The Bradleyan reply would be that this is not surprising, since our concepts incorporate all sorts of devices for disguising their basic incoherence. They would not work if there were not such devices. But to appeal to these devices is to lose sight of the underlying insight to which these seemingly rather sophistical arguments are trying to lead us.

That fundamental insight is that when we think of a thing first independently of how it stands to other things, and then as an element of a situation in which other things figure, there is really a *gestalt* switch between two incompatible ways of conceiving the situation. They are incompatible because when we envisage something as a detail in a larger whole it takes on not just characteristics additional to those we envisaged it as possessing when we think of it in isolation (or in something closer to isolation) but characteristics incompatible with this. An angel seen as a detail in a large painting looks different from when it is looked at alone. Our friend presents himself differently to us

when we learn about his or her family background. These are not merely different ways of registering the world in our mind; they are different conceptions of what is really there.

But we cannot choose either to envisage the thing in comparative isolation or as a detail in a larger situation. For, on the one hand, the very concept of a thing is of something which can be conceived without reference to other things as a separate unit in its own right, while equally we cannot avoid enriching our concept of every individual thing we postulate by envisaging it simply as a detail in some larger whole. (We may be prepared to say that some of our things, like two-dimensional objects, are mere abstractions from some larger whole, but we cannot say it of every single thing, or else we have no proper things left. Yet every single thing, the universe apart, does figure in a larger whole.)

The concept of a relation is that of something which connects things without making them simply aspects of a larger whole in which they lose their separate identities. The proposition *'A* is *R* to *B'* allows us to take up two incompatible stances, turn and turn about, as suits our convenience: that of *A* as a thing in its own right and that of *A* as an abstraction along with *B* from some larger whole. Since the proposition is thus an attempt to synthesize two incompatible views it cannot be the literal truth about anything.

It should be evident that these reflections lead by inevitable steps to the view that the only real thing is the universe and that everything else is a mere aspect of it. (The only but unthinkable alternative is that real things exist in total isolation from one another; Leibniz tended to this view though incoherently invoking God to provide a semblance of a single cosmos.)

To arrive at his final conclusion that the only reality is the Absolute, and that everything else is a mere abstraction from it, Bradley has to show that the universe merits this title in virtue of its mental or spiritual nature.

This he does by arguing that when we really press the matter there is nothing which we can form any clear idea of as existing apart from some mental process or activity. Either we tacitly envisage it as presented to some mental state, and in effect a component of that state, or as itself a mental state.

So in the end—for reasons quite separate from the argument concerning relations—we can accept only mental realities as genuinely real. The physical world, for example, must be conceived as existing only as presentation to perception or thought, or perhaps as experiencing itself.

But if the only finite realities which can pass this test of clear conceivability are mental, it follows that the universe is a single reality from which the indefinite number of mental states which so to speak supply its stuff are mere abstractions. But the only conceivable thing from which these mental states can be abstractions must be itself some sort of cosmic mental state or form of consciousness. This cannot change through time, but must rather eternally include all those mental states which appear to themselves to pertain to beings living at different times. That it is not changing in time follows from the fact that past and future and present can only appear to be related to each other because they are all abstractions from something embracing all times, and therefore itself timeless.

Critics such as Bertrand Russell and G.E.Moore were long thought to have put paid to Bradley's metaphysical system. (A more insightful critic was William James.) Upon the

whole, they missed the real thrust of it and thought that it was rebutted by exhibiting certain confusions or sophistries in its presentation. Anyone who knows anything of the Hindu tradition, especially Vedanta. (though Bradley showed no interest in this), will realize that views like Bradley's are not too eccentric to be the basis of a whole culture. Perhaps western philosophy will turn again to an outlook more like Bradley's. It must stand, at the least, as one of the great possible visions of the world open to humanity. Historically, however, it gave way soon after its completion to different styles of philosophizing in which Moore, Russell and Wittgenstein were key figures. A.N.Whitehead, however, continued, to some considerable extent along the path laid out by Bradley (envisioning a world composed solely of experience and unified in God), though he sought to do greater justice to the scientific view of things.

NOTES

1 The thinker who did most to clarify the relations between psychological hedonism, and ethical hedonism in its two versions, egoistic and universalistic, was Henry Sidgwick in his *Methods of Ethics*, London: Macmillan, 1874, with further revised editions. Although in various controversies Bradley exhibits the utmost contempt for Sidgwick I have to a limited extent made use of Sidgwick's terminology in expounding Bradley.

Other works

There are not many recent whole books devoted to Bradley's philosophy, though some are known to be in preparation. The main available works are:

15.5 McHenry, L. *Whitehead and Bradley: a Comparative Analysis*, Albany: State University of New York Press, 1992.
15.6 McNiven, D. *Bradley's Moral Psychology*, Lewiston/Queenston: Edwin Mellen Press, 1987.
15.7 Manser, A. *Bradley's Logic*, Oxford: Basil Blackwell, 1983.
15.8 Manser, A. and Guy Stock, eds, *The Philosophy of F.H.Bradley*, Oxford: Clarendon Press, 1984 (collection of essays by various names).
15.9 Sprigge, T.L.S. *James and Bradley: American Truth and British Reality*, Chicago:

Open Court, 1993.
15.10 Wollheim, R. *F.H.Bradley*, Harmondsworth: Penguin, 1959. Recent books with some general relevance include
15.11 Rescher, N. *The Coherence Theory of Truth*, Oxford: Clarendon Press, 1973.
15.12 Sprigge, T.L.S. *The Vindication of Absolute Idealism*, Edinburgh: Edinburgh University Press, 1983.
15.13 Walker, R.C.S. *The Coherence Theory of Truth*, London: Routledge 1989.

Glossary

analytic *and* synthetic—an analytic statement is true in virtue of the meanings of the words in it, e.g. 'Bachelors are unmarried males'. A synthetic statement is true not in virtue of the meanings of the words used, e.g. 'Some bachelors are rich'.

a posteriori—based on experience.

a priori—not based on experience.

***cause, efficient**—a translation of *causa efficient*, a term which was used by medieval philosophers. The term goes back to Aristotle, who stated that an 'efficient' cause is a source of change or of coming to rest (*Physics*, II, 3). So, for example, a man who gives advice is an efficient cause, and a father is the efficient cause of his child.

***cause, final**—a term that renders the Latin *causa finalis*. 'Final' does not mean here last or ultimate, as when one speaks of a 'final curtain'. Rather, a final cause is that *for the sake of which* something is done. The term goes back to Aristotle, who said that a final cause is an end: e.g. health is the final cause of taking a walk (*Physics*, II, 3).

coherence theory of truth—the view that a true statement is that which coheres, or is most consistent, with the system of accepted statements. deduction—a form of argument in which if the premisses are true then the conclusion must also be true.

definition per genus et differentiam—a form of definition in which a word is defined by locating the thing to which it refers in a class of things *(genus)* sharing some common features, and then by indicating those features which distinguish the thing from others in that class.

***determinism**—a term covering a wide variety of views, which have in common the thesis that every event or every state of affairs belonging to a certain class is determined by certain factors, in the sense that given these factors the event must occur or the state of affairs must hold. In the past philosophers readily accepted the idea that determinism held in the natural world; but many of them were reluctant to believe that it also held in the sphere of human actions. They believed that (whatever might be the case in the natural world) the will was free, in the sense that, whenever a human agent chooses to do something, that agent could always have chosen to do otherwise.

empiricism—the theory that all knowledge is based on experience.

***fatalism—**a form of determinism (q.v.) according to which what will happen, will happen, and there is nothing that humans can do to alter the course of events. Although all fatalists are determinists, not all determinists are fatalists.

hedonism—the view that pleasure is the only intrinsically valuable thing.

***idealism—**there are three main types of philosophical idealism, all of which have in common the thesis that the external world—the world of physical things—is in some way a product of mind, (1) The first historically was Berkeleian idealism. Bishop Berkeley (1685–1753) argued that a material object consists of nothing but ideas, either in the mind of God or in the mind of conscious beings such as ourselves. (2) 'Transcendental idealism' was a term used by Kant (1724–1804) to refer to his view

that the spatial and temporal properties of things have no existence apart from our minds. (3) 'Objective' or 'absolute' idealism, first expounded by Hegel (1770–1831), is distinguished by the fact that it is a kind of monism, asserting that everything that exists is a form of the one 'absolute mind'.

***induction—**an inductive argument is an argument in which, from the proposition that all observed members of a certain class have a certain property, one proceeds to the conclusion that all members of the class have this property.

law of excluded middle—the principle that every proposition is true or not true.

law of non-contradiction—the principle (sometimes also called the *law of contradiction*) that a proposition and its negation cannot both be true.

libertarian—one who denies the truth of determinism (q.v.), believing that there are some human acts which are not causally determined.

logical positivists—those who subscribe to the verification principle (q.v.).

materialism—the theory that reality is all material. The mind is therefore not something immaterial.

nominalism—the view that general terms are just words applying to particular things.

phenomenalism—the doctrine that a physical object is, as J.S.Mill put it, 'the permanent possibility of sensation'.

reductio ad absurdum—a mode of argument in which a view is shown to have an absurd implication and is therefore to be rejected.

***universals**—it has been argued that universal terms, such as 'triangle', can have meaning only if there exist in some way entities which are called 'universals', e.g. the triangle as such, or triangularity.

utilitarianism—the view that a right act is that which maximizes the general happiness.

utility, the principle of—as formulated by J.S.Mill it is the view that 'happiness is desirable, and the only thing desirable as an end; all other things being only desirable as means to that end'.

***verification principle—**also called the *principle of verifiability*. This term has two senses. (1) It can refer to a criterion of meaning; according to this, a proposition is factually significant if, and only if, it can be verified in principle. (2) The term can also be applied to a theory of the nature of meaning; this states that the meaning of a proposition is the method of verifying it.

Routledge History of Philosophy, Volume VIII

Continental philosophy, as it has emerged in the twentieth century, is less a seamless fabric than a patchwork of diverse strands. Phenomenology, hermeneutics, existentialism, structuralism, critical theory, deconstruction—these are some of the salient movements which have developed in continental Europe between 1900 and the 1990s, though their influence is by no means confined to geographical location. Continental thought has proved highly exportable, circulating far beyond the frontiers of Europe to provoke strong responses in the intellectual world at large.

The fourteen articles in this volume outline and assess some of the issues and experiments of continental philosophy. The first five span the twin movements of phenomenology and existentialism, running from Husserl and Heidegger to Sartre, Merleau-Ponty and Levinas. Subsequent essays deal with specific currents of continental thought in such areas as science, Marxism, linguistics, politics, aesthetics, feminism and hermeneutics. A final chapter on postmodernism highlights the manner in which so many concerns of continental thought culminate in a radical anti-foundationalism.

This volume provides a broad, scholarly introduction to this period for students of philosophy and related disciplines, as well as some original interpretations of these authors. It includes a glossary of technical terms and a chronological table of philosophical, scientific and other cultural events.

Richard Kearney is a Professor of Philosophy at University College, Dublin and a Visiting Professor at Boston College. He is the author of *Poetics of Modernity* (1994), *Poetics of Imagining* (1991), *The Wake of Imagination* (1988), *Modern Movements in European Philosophy* (1986) and *Dialogues with Contemporary Continental Thinkers* (1984).

Routledge History of Philosophy

General editors—G.H.R.Parkinson and S.G.Shanker

The *Routledge History of Philosophy* provides a chronological survey of the history of Western philosophy, from its beginnings in the sixth century BC to the present time. It discusses all major philosophical developments in depth. Most space is allocated to those individuals who, by common consent, are regarded as great philosophers. But lesser figures have not been neglected, and together the ten volumes of the *History* include basic and critical information about every significant philosophy of the past and present. These philosophers are clearly situated within the cultural and, in particular, the scientific context of their time.

The *History* is intended not only for the specialist, but also for the student and the general reader. Each chapter is by an acknowledged authority in the field. The chapters are written in an accessible style and a glossary of technical terms is provided in each volume.

General editors' preface

The history of philosophy, as its name implies, represents a union of two very different disciplines, each of which imposes severe constraints upon the other. As an exercise in the history of ideas, it demands that one acquire a 'period eye': a thorough understanding of how the thinkers whom it studies viewed the problems which they sought to resolve, the conceptual frameworks in which they addressed these issues, their assumptions and objectives, their blind spots and miscues. But as an exercise in philosophy, we are engaged in much more than simply a descriptive task. There is a crucial aspect to our efforts: we are looking for the cogency as much as the development of an argument, for its bearing on questions which continue to preoccupy us as much as the impact which it may have had on the evolution of philosophical thought.

The history of philosophy thus requires a delicate balancing act from its practitioners. We read these writings with the full benefit of hindsight. We can see why the minor contributions remained minor and where the grand systems broke down: sometimes as a result of internal pressures, sometimes because of a failure to overcome an insuperable obstacle, sometimes because of a dramatic technological or sociological change, and, quite often, because of nothing more than a shift in intellectual fashion or interests. Yet, because of our continuing philosophical concern with many of the same problems, we cannot afford to look dispassionately at these works. We want to know what lessons are to be learnt from the inconsequential or the glorious failures; many times we want to plead for a contemporary relevance in the overlooked theory or to reconsider whether the 'glorious failure' was indeed such or simply ahead of its time: perhaps even ahead of its author.

We find ourselves, therefore, much like the mythical 'radical translator' who has so fascinated modern philosophers, trying to understand author's ideas in their and their culture's eyes, and at the same time, in our own. It can be a formidable task. Many times we fail in the historical undertaking because our philosophical interests are so strong, or lose sight of the latter because we are so enthralled by the former. But the nature of philosophy is such that we are compelled to master both techniques. For learning about the history of philosophy is not just a challenging and engaging pastime: it is an essential element in learning about the nature of philosophy—in grasping how philosophy is intimately connected with and yet distinct from both history and science.

The *Routledge History of Philosophy* provides a chronological survey of the history of Western philosophy, from its beginnings up to the present time. Its aim is to discuss all major philosophical developments in depth, and, with this in mind, most space has been allocated to those individuals who, by common consent, are regarded as great philosophers. But lesser figures have not been neglected, and it is hoped that the reader will be able to find, in the ten volumes of the *History,* at least basic information about any significant philosopher of the past or present.

Philosophical thinking does not occur in isolation from other human activities, and this

History tries to situate philosophers within the cultural, and in particular the scientific, context of their time. Some philosophers, indeed, would regard philosophy as merely ancillary to the natural sciences; but even if this view is rejected, it can hardly be denied that the sciences have had a great influence on what is now regarded as philosophy, and it is important that this influence should be set forth clearly. Not that these volumes are intended to provide a mere record of the factors that influenced philosophical thinking; philosophy is a discipline with its own standards of argument, and the presentation of the ways in which these arguments have developed is the main concern of this *History*.

In speaking of 'what is now regarded as philosophy', we may have given the impression that there now exists a single view of what philosophy is. This is certainly not the case; on the contrary, there exist serious differences of opinion, among those who call themselves philosophers, about the nature of their subject. These differences are reflected in the existence at the present time of two main schools of thought, usually described as 'analytic' and 'continental' philosophy respectively. It is not our intention, as general editors of this *History,* to take sides in this dispute. Our attitude is one of tolerance, and our hope is that these volumes will contribute to an understanding of how philosophers have reached the positions which they now occupy.

One final comment. Philosophy has long been a highly technical subject, with its own specialized vocabulary. This *History* is intended not only for the specialist but also for the general reader. To this end, we have tried to ensure that each chapter is written in an accessible style; and since technicalities are unavoidable, a glossary of technical terms is provided in each volume. In this way these volumes will, we hope, contribute to a wider understanding of a subject which is of the highest importance to all thinking people.

G.H.R.Parkinson
S.G.Shanker

Notes on contributors

Alison Ainley is Lecturer in Philosophy at Anglia Polytechnic University, Cambridge, and author of a forthcoming book on Luce Irigaray.

Babette Babich is Professor of Philosophy at Fordham University, New York, and author of several studies on continental thought.

Richard Cobb-Stevens is Head of the Philosophy Department at Boston College and author of *James and Husserl* (1974) and *Husserl and Analytic Philosophy* (1989).

Simon Critchley is Lecturer in Philosophy at the University of Essex and author of *The Ethics of Deconstruction* (1992) and co-editor of *Re-Reading Levinas* (1991).

Bernard Cullen is a Professor of Philosophy at Queen's University, Belfast, editor of the *Irish Philosophical Journal* and author of *Hegel and Political Theory*.

William Desmond is Chair of Philosophy at Loyola College, Baltimore, visiting professor at Louvain University and author of *Desire, Dialectic and Otherness* (1988), *Art and the Absolute* (1986) and *Philosophy and its Others* (1991).

Thomas Docherty is Chair of the Department of English at Trinity College, Dublin and author of *On Modern Authority* (1987), *Reading (Absent) Character* (1983), *John Donne, Undone* (1986) and *After Theory* (1991).

Thomas R.Flynn is Professor of Philosophy at Emory University and author of several studies of modern continental thought.

Michael Kelly is Professor of French at the University of South-hampton, and author of several books including *Modern French Marxism* (1982).

Gary Madison is Professor of Philosophy at McMaster University, Canada and founder-director of the Canadian Society of Hermeneutics and Postmodern Thought. He is the author of *Phénoménologie de Merleau-Ponty* (1973), *Understanding* (1982), *Logic of Liberty* (1986) and *Hermeneutics of Postmodernity* (1988).

Timothy Mooney is a Lecturer in Philosophy at University College, Dublin, and author of several studies of modern European thought.

Mara Rainwater is a Lecturer in Philosophy at University College, Dublin. Her special areas of interest include Critical Theory, Nietzsche, and Communicative Ethics.

David Rasmussen is Professor of Philosophy at Boston College, founder-editor of the journal *Philosophy and Social Criticism* and author of *Reading Habermas* (1991).

Giacomo Rinaldi is Professor of Philosophy at the University of Urbino and an expert in German and Italian idealist philosophy.

Hugh J.Silverman is Professor of Philosophy and Comparative Literature at the State University of New York at Stony Brook and author of *Inscriptions: Between Phenomenology and Structuralism* (1987), editor of *Philosophy and Non-Philosophy since Merleau-Ponty* (1988) and Executive Director of the International Association for Philosophy and Literature.

Jacques Taminiaux is Professor of Philosophy at the University of Louvain and Boston College, Director of the Centre d'études phénoménologiques at Louvain University,

and author of many books on continental philosophy including *Dialectic and Difference* (1985), *Heidegger's Project of Fundamental Ontology* (1991) and *Poetics, Speculations and Judgment* (1994).

1821	Hegel, *Philosophy of Right* Schleiermacher, *The Christian Faith* (2 vols)	De Quincey, *Confessions of an Opium Eater* Heine, *Poems*
1822		
1825	Saint-Simon, *The New Christianity*	
1826		Hölderlin, *Lyrical Poems*
1827		
1830	Comte, *Positive Philosophy* (6 vols, 1830–42) Feuerbach, *Thoughts Concerning Death and Immortality*	Berlioz, *Symphonie Fantastique* Stendhal, *The Red and the Black*

1831		
1832	Goethe, *Faust* (Pt II)	
1837Bolzano, *Scientific Writings* (4 vols)	Balzac, *Lost Illusions* (1837–43)	

Science and technology	**Politics**	
	French occupy Spain; Joseph Bonaparte becomes King of Spain	1808
		1809
Avogadro's Molecular Hypothesis	Luddite riots in England against mechanization in the textile industry	1811
	500,000 of Napoleon's army die in retreat from Moscow	1812
	Coalition of Austria, Prussia, Russia, Britain and Sweden invades France	1813
Laplace, *A Philosophical Essay on Probabilities*	Treaty of Paris ends Napoleonic Wars; Napoleon abdicates and is exiled to Elba; Congress of Vienna	1814
	Napoleon escapes Elba; marches on Paris; Battle of Waterloo; Napoleon exiled to St Helena	1815
Kaleidoscope (Brewster)		1817
	Aix-la-Chapelle: France joins great powers in Quintuple Alliance	1818
Electromagnetism (Oersted)	Liberal revolutions in Spain, Portugal, and Italy	1820
		1821
Camera (Niepce)		1822
Electromagnet (Sturgeon)	In Russia, Decembrist Rising against Tsar	1825
Laws of Electromagnetism (Ampère) First permanent photograph (Niepce)		1826
Ohm's Law of Electromagnetic Conduction		1827
Lyell, *Principles of Geology* (3 vols)	Paris July Revolution Charles X overthrown; Louis-Philippe King (to 1848)	1830
Electromagnetic induction (Faraday and Henry)	Mazzini forms 'Young Italy' movement; Polish revolution crushed by Russians	1831
	Reform Act passed in Britain	1832

	Continental philosophy: roots and dialogue	The arts
1839	Feuerbach, *Towards a Critique of Hegelian Philosophy*	
1841	Feuerbach, *The Essence of Christianity* Proudhon, *What Is Property*?	Emerson, *Essays* (1841–4) Turner, *Snowstorm—Steamboat off a Harbour's Mouth*
1842		Gogol, *Dead Souls* G.Sand, *Consuelo*
1843	Feuerbach, *Provisional Theses* Kierkegaard, *Fear and Trembling* Kierkegaard, *Repetition* Kierkegaard, *Either/Or* Marx, *Critique of Hegel's Philosophy of Right*	Ruskin, *Modern Painters*
1844	Kierkegaard, *The Concept of Dread* Marx, *The Paris Manuscripts* Stirner, *The Ego and Its Own*	Chateaubriand, *Life of Rancé*
1845	Marx, *Theses on Feuerbach* Marx and Engels, *The Holy Family*	Gautier, *España*
1846	Kierkegaard, *Concluding Unscientific Postscript* Marx and Engels, *The German Ideology*	Michelet, *The People*
1848	Marx and Engels, *Communist Manifesto*	
1851	Proudhon, *General Idea of the Revolution in the 19th Century*	Sainte-Beuve, *Lundis*
1852		Grimm, German Dictionary (vol. 1, 1852–4)
1854		Nerval, *Aurélia*
1855		Transformation of Paris by Haussmann
1857	Marx, drafts *Grundrisse*	Flaubert, *Madame Bovary* Baudelaire, *Les Fleurs du mal*
1859		
1862	Brentano, *On the Manifold Sense of Being in Aristotle*	Hugo, *Les Misérables* Turgenev, *Fathers and Sons*
1863	Proudhon, *On the Federal Principle*	Salon des Refusés—Paris Tolstoy, *War and Peace* (1863–9)

Science and technology	Politics	
Vulcanized rubber (Goodyear) Ozone discovered (Schönbein)	Opium War between China and Britain	1839
		1841
'Doppler Effect' predicted the apparent change in wavelength when the observer and wave source are in relative motion (C.Doppler)	Hong Kong ceded to Britain	1842
	Natal becomes British colony	1843
		1844
		1845
Planet Neptune discovered (Galle) Sewing machine (Howe)	Potato famine in Ireland (a million dead by 1851)	1846
	Revolutions throughout Europe Louis-Philippe abdicates in Paris	1848
	Bakunin imprisoned by Tsar (1851–7)	1851
Gyroscope (L.Foucault)		1852
	Crimean War: France, Britain, and Turkey against Russia (to 1856)	1854
Celluloid (Parkes) Conversion process for steel (Bessemer)		1855
	Indian mutiny (Lucknow) against Britain	1857
Darwin, *The Origin of Species* Internal combustion engine (Lenoir)		1859
Rapid repeat-fire gun (Gatling)	Bismarck becomes Prime Minister in Prussia	1862
	French occupation of Mexico City Lincoln emancipates slaves	1863

Continental philosophy: roots and dialogue	The arts
1864	Dostoyevsky, *Notes from Underground*
1865Taine, *Philosophy of Art*	Wagner, *Tristan and Isolde*
1866	Dostoyevsky, *Crime and Punishment*

1867	Marx, *Das Kapital*	Ibsen, *Peer Gynt*
1869		Wagner, *Ring Series* produced 1869–76
1870	Dilthey, *The Life of Schleiermacher*	Rosetti, *Poems*
1871		Zola, *Rougon-Macquart Series*

Introduction

Richard Kearney

Continental philosophy, as it has emerged in the twentieth century, is less a seamless fabric than a patchwork of diverse strands. Phenomenology, hermeneutics, existentialism, structuralism, critical theory, deconstruction—these are some of the salient movements which have developed in continental Europe between 1900 and the 1990s, though their influence is by no means confined to their area of origin. Continental thought has proved highly exportable, circulating far beyond the frontiers of Europe to provoke strong responses in the intellectual world at large.

It is worth recalling at the outset that the term 'continental' philosophy was coined not by European thinkers themselves but by academic philosophy departments in the Anglo-American world eager to differentiate it from 'analytic' thought. It was initially more a label of convention than a category corresponding to a given essence of thought. But whatever the origin or accuracy of the distinction, what became known as 'continental philosophy' has managed to exert a decisive impact on contemporary thought over the decades—an impact which exceeds the specialized discipline of academic philosophy and embraces such diverse fields as sociology, political science, literary theory, theology, art history, feminism and a variety of cultural studies.

Some view this protean character of continental thought as a defect—a sign that it cannot be rigorous or reliable. If it can be applied to anything in general it must be saying nothing in particular! More an art *(Kunst)* than a science *(Wissenschaft)*! More an exercise in poetic intuition than ratiocinative inquiry! What these objections tend to ignore, however, is that most founding fathers of continental thought were committed to a view of philosophy as science and saw themselves as guided by a basic notion of critical reason. Edmund Husserl, for instance, spoke of phenomenology as a 'rigorous science', while his disciple Heidegger regarded it as a transcendental science of thecategories of Being. Even Sartre, the combative pioneer of French existentialism, sought to apply phenomenology to an historical 'critique of dialectical reason'.

Similar scruples operate in other major currents of continental thought. Ferdinand de Saussure, founder of structuralism, spoke of semiology as a 'science of signs'; and the works of such disciples as Lévi-Strauss, Foucault, Althusser, Lacan or the early Barthes were each marked by a determination to apply the structural model of language to a variety of disciplines (anthropology, historiography, historical materialism, psychoanalysis, sociology). One even finds critical theory and hermeneutics combining philosophical inquiry with other human sciences—with Paul Ricoeur calling for a creative dialogue between a historical 'understanding' *(Verstehen)* alert to the contingencies of human circumstance, and scientific 'explanation' *(Erklären)* committed to goals of universal objectivity. Many continental thinkers have sought to redefine and reinterpret reason, but few would claim to jettison it altogether.

Perhaps the most persistent feature of continental philosophy, through all its multiple mutations, is a commitment to the *questioning of foundations*. From phenomenology to deconstruction, one encounters the persuasion that the old foundationalist arguments no longer suffice. Meaning is not some metaphysical essence or substance; it is a task of intersubjective and intertextual relations. Truth cannot be grounded on a given system of being (realism) or mind (idealism); it must be radically rethought as an interplay of differences (perspectives, *Abschattungen,* intentionalities, situations, structures, signifiers, etc.). Continental philosophy thus finds itself renouncing the metaphysical quest for absolute grounds, even if some of its proponents—Husserl in particular—found this renunciation vexed and regrettable. Kant's claim to 'lay the foundation of knowledge', Hegel's appeal to Absolute Spirit, Kierkegaard's recourse to a Transcendent Deity, Marx's call for a Total Science, are largely superseded (albeit often reinterpreted) by continental thinkers in the twentieth century.

But if metaphysical foundationalism is one adversary, positivism is another. Reductionist attempts to explain away *meaning* in terms of *facts* are invariably resisted by phenomenologists, existentialists, critical theorists and postmodernists. Philosophical questioning, they argue, requires the specific methodology of a human science *(Geisteswissen-schaft);* and while remaining in critical dialogue with the empiricometric procedures of natural sciences *(Naturwissenschaft),* it must not be *reduced* to the latter. Both methods are valid. It is the effort to confound or conflate them that leads to misunderstanding.

This is not to suggest that the critique of positivism is an exclusively continental concern. Analytic thinkers inspired by the laterWittgenstein, Ryle, Davidson or Dummett, show equal resolve in disentangling such category mistakes. But the reasons for doing so are different in each case. Generally speaking, analytic thinkers seek to avoid such error in the interests of clarity, evidence, verification and coherence; continentals appear more impelled by ontological scruples to keep thought open to 'irreducibles' and 'undecidables'—that is, to questions which surpass the limits of 'pure reason'—questions of being and nothing, of transcendence and difference, of alterity and historicity.

The reference to Kant here is perhaps useful. Continental philosophers have often tended to privilege the moral and aesthetic questioning of the Second and Third *Critiques* over the strictly epistemological reading of the First. This is not to say that they ignore the First but that they read it in a particular way. For example, while both analytic and continental thinkers share a common commitment to Kant's *transcendental aesthetic,* (the origination of all experience in sensible time and space), the former tend to show preference for the *transcendental analytic* (dealing with objective categories of understanding), whereas the latter incline more towards the 'limit ideas' of World, Soul and Freedom contained in the *transcendental dialectic*. To put this more succinctly, continental thought is on balance more likely than analytic thought to bypass the confines of pure reason, venturing into the liminal areas of noumenal experience and dialectic. Indeed Husserl's repudiation of the Kantian distinction between phenomenal and noumenal in his *Logical Investigations* (1900–1) already signalled this direction. Continental philosophy, it could be said, favours dialectical and practical reason over 'pure' reason. It holds that *being* is ultimately irreducible to *verification, meaning* to *evidence, truth* to *coherence, time* to *measurement, paradox* to *problem*.

This raises the controversial subject of style. Continental philosophy is marked by distinctive signatures of thinking and writing. Its practitioners would claim, for instance, that extraordinary questions of experience cannot always be expressed in ordinary language. Ideas of 'dialectical' reason (as both Kant and Hegel realized in their different ways) cannot be translated into categories of 'pure' reason. And the attendant *surplus of meaning* requires that standard criteria of correspondence and coherence have to be occasionally transgressed. This is by no means unprecedented in philosophy. As Heidegger points out in his introduction to *Being and Time,* Aristotle's innovative use of language to express his discovery of being was far from transparent to his original Greek readers. This line of reasoning could be construed as an 'anything goes' argument; but there is more to it than that. A certain experimental *style de pensée* is the risk certain philosophers are prepared to take in order to say the unsayable (or, in Beckett's ludic phrase, to 'eff the ineffable'). Adorno, Heidegger, Merleau-Ponty, Lacan, Levinas, Derrida, Kristeva—each has his or her own inimitable voices.

Finally, it must be acknowledged that continental philosophy does not arise in a vacuum. True to its conviction that thought is always *situated,* the predominant mood of such philosophy, from existentialism to postmodernism, is one deeply committed to moral and political questions. Thinking is no longer regarded as some neutral exercise in cognition but an intervention in the 'lived world' of history and society. This responsiveness of ideas to the *Lebenswelt* was, in the case of modern continental thought, radically informed by the experience of two world wars on European soil—and the corresponding horrors of Auschwitz and the Gulag. Husserl was one of the first to register this sense of breakdown and disorientation when, fleeing from Nazi Germany, he called for a fundamental rethinking of the western intellectual tradition. And most continental philosophers after him have shared this persuasion, advancing forms of inquiry that are increasingly exploratory, tentative, iconoclastic, *engagé*. Critical theorists from Horkheimer to Habermas, existentialists from Merleau-Ponty to de Beauvoir, structuralists from Barthes to Foucault, not to mention postmodernist thinkers like Lyotard and Vattimo, all demonstrate a keen preoccupation with social and political issues. The common challenge is to start all over again, seeking alternative modes of questioning. Totalizing Archimedean principles are renounced. Meaning and value are to be reinterpreted from first to last. Recurrent crises call for perpetual revision. And it is perhaps this urgency to respond to the trauma of historical change that has compelled so many continentals to abandon the metaphysical obsession with foundations in favour of post-metaphysical experiments of thought.

The fourteen essays in this volume outline and assess some of these experiments. The first five span the twin movements of phenomenology and existentialism, running from Husserl and Heidegger to Sartre, Merleau-Ponty and Levinas. Subsequent essays deal with specific currents of continental thought in such areas as science, Marxism, linguistics, politics, aesthetics, feminism and hermeneutics, while a final essay on postmodernism highlights the manner in which so many concerns of continental thought culminate in a radical anti-foundation-alism. Each study speaks for itself; but I wish to thank the contributors, drawn from six different countries, for their co-operation and collegiality in putting this volume together. It has been a gratifying reminder that for all the controversies surrounding continental philosophy, it remains a forum of debate where

critical intelligence, scholarly expertise and a passionate commitment to the burning issues of our time are still alive and well.

The beginnings of phenomenology

Husserl and his predecessors

Richard Cobb-Stevens

Edmund Husserl was the founder of phenomenology, one of the principal movements of twentieth-century philosophy. His principal contribution to philosophy was his development of the concept of intentionality. He reasserted and revitalized the premodern thesis that our cognitional acts are intentional, i.e., that they reach out beyond sensa to things in the world. When we think or speak about things, and when we perceive them, we deal with those things and not with mental intermediaries. Intentionality is our openness to the world, our transcending mode of being. Husserl also developed the implications of this fundamental thesis. He repudiated Locke's interpretation of 'mind' as an inner space set off from the rest of nature, and he rejected Kant's distinction between phenomena and things-in-themselves. He also rejected the view that the task of philosophy is to guarantee that our concepts and theories somehow mirror the world.

These themes brought a sense of liberation to many philosophers who by the early decades of the twentieth century had become weary of the insoluble problems generated by the modern account of cognition. Husserl's analysis of signs and semantic systems had a similar effect in the fields of linguistics and logic which had been dominated by associationist and psychologistic accounts of the production of meaning. His interpretation of the complementarity of pre-scientific and scientific modes of rationality contributed to the demise of positivism and inspired new and fruitful approaches in the social sciences. His theories of time and ego-identity provided much-needed correctives to reductionist tendencies in psychology. Finally, his balanced interpretation of the interplay between historical horizons and the drive fortruth offers a reasonable alternative to the contemporary tendency to regard all truths as relativized by their historical conditions.

It is unfortunate that Husserl's writings had little influence on the development of the tradition of analytic philosophy, the other major movement of twentieth-century philosophy. Husserl himself engaged in spirited but amicable debate with Gottlob Frege, who is generally considered to be the proximate founder of analytic philosophy. However, such exchanges became increasingly rare among their followers who have tended on the whole to ignore one another's works. This breakdown of communication was due in part to an early misunderstanding. Frege thought that Husserl was a proponent of psychologism, i.e., the view that numbers, propositions and logical laws are reducible to mental states. Frege's critique of Husserl's alleged psychologism was decisive for a whole generation of analytic philosophers whose goal was to defend rationality from relativism by detaching logic and semantics from all dependence on what they took to be

irremediably subjective intuitions. On the other hand, Frege's decision to divorce logical analysis entirely from cognitive intuition alienated philosophers within the phenomenological tradition who saw in this strategy only a revival of Hobbes's preference for an exclusively calculative rationality. Ironically, Husserl's critique of psychologism was in fact more coherent and more complete than that of Frege and his followers, for he showed how propositions are grounded in cognitive intuitions without thereby being reduced to merely subjective phenomena. In recent years both phenomenological and analytic traditions have found themselves increasingly vulnerable to contemporary forms of historicism and relativism. This situation has had the felicitous effect of encouraging within both traditions a reappraisal of the reasons for their mutual distrust. Considerable progress has been made of late in restoring a climate conducive to renewed dialogue.

In the judgment of many, the originality of Husserl's thought and the rigour of his analyses guarantee him a place among the greatest of philosophers. However, his writings tend to be excessively abstruse and technical. As a result, his readership has generally been limited to professional philosophers. By contrast, Martin Heidegger's more evocative philosophical style and Jean-Paul Sartre's literary brilliance assured for the subsequent phenomenological tradition a wider audience and an unusually immediate cultural influence. This is not to say that these thinkers were merely commentators on Husserl (indeed, many regard Heidegger as a more profound and original thinker), but only that they often succeeded in communicating the basic insights of Husserl's phenomenology more clearly and forcefully than did Husserl himself. There is another reason why Husserl's writings often failed to convey to his readers the full force of his criticism of the modernepistemological perspective. It seems clear, in retrospect, that he was not sufficiently sensitive to the gravitational pull that the language of modern philosophy exercised on his thought. He explicitly modified the senses of such key modern terms as 'presentation', 'content', 'immanence', 'subjectivity', 'phenomenon', but he never completely jettisoned the lexicon of modern philosophy. Indeed, he always maintained a conservative stance with regard to innovative philosophic language, preferring to take familiar terms to their limits rather than to introduce unusual metaphors and neologisms. He therefore failed to appreciate the extent to which the familiar linguistic matrix of modern philosophy conceals a long history of accumulated premises which determine the kinds of questions that readers would bring to his texts. His goal was to call those premises into question, but his philosophical vocabulary tended too often to reinforce them. It is unfortunate, too, that Husserl seems to have had little first-hand familiarity with ancient and medieval philosophic texts. He was always more at home with the traditions of British empiricism and Kantian criticism. Had he been more attuned to the weight of words in the development of philosophic concepts, and better informed about the ancient and medieval traditions, his breakthrough would no doubt have been less plagued by ambiguities and less subject to misinterpretations.

Husserl was born in Prossnitz, a town then located in Austria. He took courses in mathematics at the universities of Leipzig, Berlin and Vienna. In Berlin, he studied with the renowned mathematicians Leopold Kronecker and Karl Weierstrauss, and also attended occasional lectures in philosophy by Wilhelm Wundt. He received his Ph.D. in 1882 from the University of Vienna for a dissertation entitled 'Contributions to the

Theory of the Calculus of Variations'. After a year in Berlin as assistant to Weierstrauss, he returned to Vienna to study philosophy with Franz Brentano, who had recently resigned his chair of philosophy. In 1886, on Brentano's recommendation, Husserl went to Halle to work with Karl Stumpf, who supervised the thesis submitted for his *Habilitation,* a study of the concept of number. From 1887 to 1928, Husserl held teaching positions at Halle, Göttingen, and Freiburg im Breisgau.

As a Jew, Husserl was increasingly the subject of harassment during his retirement years in Freiburg. It must have been an especially cruel blow to have found himself denied access to the library of the university he had served so well. After his death in 1938, Husserl's unpublished manuscripts were saved from destruction by Hermann Van Breda, a Belgian priest and philosopher, who also arranged for Husserl's wife and daughter to be sheltered in a Belgian convent during the occupation. Van Breda subsequently founded the Husserl Archives at Louvain.

Husserl was a person of high moral character and of impeccable intellectual integrity. He looked upon philosophy as a vocation, and felt personally called upon to defend reason against the various forms of relativism prevalent in his day. However, his was never a merely defensive or narrowly conservative project. Indeed, he often expressed admiration for the sceptical tradition in philosophy, and thought that Hume's radical critique of presuppositions made him the greatest of modern philosophers. He also rejected the arrogance and chauvinism of those who claimed that philosophy had achieved its culmination in German thought and expression. Philosophy, he argued, cannot be the exclusive property of any single culture or language, for the emergence of the philosophic spirit introduced a new mode of teleology characterized by the complementary traits of universality and infinity. The telos of philosophy is universal in that it strives to attain an identical truth which is valid for all who are no longer blinded by traditions, and infinite in that this goal of truth can never be fully realized and thus remains always a regulative idea. By reason of its universality, therefore, philosophy cannot be limited to a particular period or people, and by reason of its infinity philosophy remains always an unending process ([1.33], 286; [1.89], 151–60).

During his lifetime Husserl published several books and also left an extraordinary number of manuscripts, lecture notes and working papers. Both the published works and the unpublished materials contain many repetitive passages, tantalizingly unfinished descriptions, and agonizing reappraisals of earlier positions. As a result, it is often difficult to co-ordinate earlier and later works, or even to be sure of the direction ultimately taken by his thought. Husserl would not be entirely displeased by this situation, for he concluded finally that there can be no totalizing syntheses. We must strive for objectivity, and hope for progress towards that goal, but we must also acknowledge all the while that the goal of truth functions always as 'the idea of an infinite task' ([1.33], 291).

EARLY WORKS: INFLUENCE OF FREGE BRENTANO, HERBART, STUMPF AND LOTZE

Husserl's first published work, *Philosophy of Arithmetic* (1891), was a revised version of

his earlier analysis of the concept of number. Adopting a distinction first made by Brentano, Husserl distinguishes between intuitive presentation and symbolic intention of numbers. He describes how our primitive intuitions about numbers and their interrelationships are based upon the experiences of counting, comparing and collecting, and how we think in symbols of more complex numbers for whichthere can be no such authenticating intuitions. Unfortunately, he makes several remarks which give the impression that he conflated numbers and their presentations. For example, he refers to the unity of a number as a psychic relation, and claims that understanding the concept of a number requires reflection on its presentation in relevant acts of collective combination. In 1894, Frege called attention to these compromising remarks in a critical review of Husserl's book. He objected that Husserl's analysis blurs the distinction between subjective and objective domains, and concluded that his work was a typical example of psychologism ([1.65], 200–1). While Frege's critique finds some justification in Husserl's text, this extreme conclusion is unwarranted. Frege was inclined to regard as psychologistic any attempt to relate the status of numbers to the activities of counting and collecting. Hence, he was not likely to be attuned to the nuances of Husserl's intention which was surely not to collapse the objectivity of numbers into their acts of presentation but rather to describe just how their objectivity manifests itself to us. At any rate, Husserl later distinguished clearly between numbers and their presentations, and between the concept of number and the concept of collective combination ([1.35], 784; [1.86], 24). Frege also criticized Husserl for holding the view that numbers are totalities (determinate multitudes) comprised of mere 'somethings' having no specific content and yet somehow differing from one another. However, this is a caricature of Husserl's position, for he clearly maintains that objects are always identified by way of their features. His point is simply that, once we have identified objects to be counted, we prescind from the determinate content of those objects in the instance numbering them.

It took some time, however, for Husserl to clarify the ambiguities generated by his continued dependence on the linguistic and conceptual framework of the empiricist tradition, which was the remote forerunner of late nineteenth-century psychologism. In his essay 'Psychological Studies in the Elements of Logic' (1894), he makes the unequivocal claim that our cognitive intuitions truly present the things intended by our speech acts. Moreover, he distinguishes clearly between mental acts and their contents, a distinction that had been blurred by the empiricist notion of a mental 'process', which in effect reduces cognitive acts to the mere having of associatively modified impressions. Nevertheless, he constantly uses the term 'contents' in an ambiguous fashion, sometimes to refer to ill-defined mental representations and sometimes to refer to things in the world in so far as they are known. Hence he does not yet make it clear that the intended objects of both our signitive and intuitive acts are, ordinarily at least, things in the world rather than mental substitutes ([1.40], 126–42; [1.122], 34–8).

These ambiguities testify to the influence of Brentano on the earlyHusserl. Brentano rejected the empiricists' reduction of mental acts to associative reactions, reaffirmed at least vaguely the medieval distinction between acts and contents, and retrieved in part the ancient thesis that cognitive acts reach out to the intended objects themselves. He is therefore rightly celebrated for having revived the theory of intentionality. However, his interpretation of this notion intermingled modern and premodern themes. His early

writings described intentional contents in ways that evoke the modern notion that impressions and ideas function as intra-mental substitutes for inaccessible real objects of reference. He said, for example, that every intentional experience 'contains something as its object within itself, and referred also to this 'immanent objectivity' as the 'intentional in-existence of an object' ([1.45], 88–9).

Although Brentano explicitly related his account of intentionality to the scholastic tradition, and traced its origin to Aristotle's books on the soul, he unfortunately tended to read the modern interpretation of immanence into the medieval theme of *esse intentionale*. It is true that the Scholastics used the term 'intentional' (and more frequently the term 'objective') to refer to the mode of being had by things known, in so far as they are present in the knower. The point of the medieval distinction between intentional (objective) being and real being was to clarify Aristotle's claim that the knower 'is somehow' the form of the thing known, without thereby entering into physical identity with the thing. It was thought that the intentional object ('inner word', 'formal concept', 'expressed species') functions as a unique sort of intermediary, i.e., as a transparent sign through which the mind is related to reality ([1.101], 62 n. 3). Although this emphasis on the mediating function of formal concepts may well have prepared the way for the modern thesis that to know is to have a representation of something (its 'idea' or 'concept') within the mind's interiority, the medieval thinkers themselves clearly maintained that the intentional object is the very thing itself, considered as known (Aquinas, *De Veritate,* iv, 2 ad 3).

Aristotle does not seem to have thought it necessary to postulate any intermediary, however special, between intellect and thing known. Indeed, he suggests that the intellect must itself be free of formal structure, and hence empty of content, so that it can become the forms of all things. The intellect, says Aristotle, possesses the same son of adaptability as the human hand. It takes on the forms of things in the way that the human hand grasps tools (Aristotle, *De Anima,* 423a 1–3; [1.90], 132–7). Thus, the intellect operates within the realm of nature itself rather than within some subjective enclosure. Its mode of being is its transcending function. Aristotle further describes a thing's form as its sortal feature, its 'look' *(eidos)*. The look is *what* we know when we know *this* particular thing. Although there is a difference between intuiting an individual *qua* individual (the primary substance), and intuiting its species-look (the secondary substance), these modes of intuition are complementary and interdependent. We grasp the species-look both as a surplus whose sense exceeds the particularity of this instance and as a condition for the manifestation of the particular (Aristotle, *Metaphysics,* 1042a 17–49). Aristotle also emphasizes the continuity between perception and predication. Predicative discourse gives syntactical articulation to the inarticulate nuances of intuition (Aristotle, *On Interpretation,* 16b 25–6). Judging is therefore directed primarily upon things and their perceived features, not upon propositions as such.

Brentano revived the Aristotelian notion that the intellect's intentional targets are things in the world, but he imagined the intellect's grasp of forms as taking place within the mind's inner space. He therefore concluded that the intellect could never effectively reach those targets. Brentano also subscribed wholeheartedly to the modern interpretation of perception. He claimed that our perceptions yield merely subjective appearances, and he appealed to physical causality alone in order to account for the relationship between

these appearances and real objects. Corresponding to perceived colours, he claimed, there are only the 'vibrations' which emanate from the interaction of atoms, molecules and forces. A thing's true being, therefore, is its hidden quantifiable reality accessible only to the methods of the natural sciences. Perceived objects do not exist really outside of us; they are *mere* phenomena ([1.45], 9–10). In his later works, Brentano nevertheless claimed that linguistic references are ordinarily directed upon transcendent real entities, rather than upon mental contents. However, there is no indication that this new position entailed a critique of the empiricist account of intuition. Everything suggests a compromise: we refer to real things, but we see only phenomena. Moreover, Brentano adopted the modern interpretation of the relationship between assertive and predicative moments of judgment. Judgment, he says, is an act of acceptance or denial directed upon some presentation. This definition implies that judging is not primarily directed upon things and their perceived features, but upon intra-mental or ideal contents ([1.45], 198–9).

Dallas Willard's historical research has demonstrated how the influence of Johann Friedrich Herbart, Karl Stumpf and Hermann Lotze helped Husserl to make a more decisive break with the empiricist tradition than that achieved by Brentano ([1.122], 30–4). Herbart defined 'apperception' as the 'awareness of what is going on in us', and subsequently distinguished clearly between awareness of the activity of thinking and awareness of its content ([1.72], v, 43). Stumpf, to whom Husserl dedicated his *Logical Investigations,* held that second-order representations (such as the idea of a causal nexus) may arise out of first-order representations, and that the former are not reducible to associative manipulations of the latter. In short, he held that we somehow perceive causal connections ([1.112], 5). Lotze broke away even more completely from the empiricist position. Whereas Hume had claimed that the impression of the mind's transition (which accounts for the idea of necessary connection) is reducible to the process of transition itself, Lotze asserted unequivocally that ideas of relations depend on a reflexive awareness of the mind's transitions. Moreover, he drew a distinction between the object of the reflexive act (a second-order mental content) and the relationship represented as obtaining between the transcendent objects of the first-order impressions ([1.78], 537–8). Willard points out that these distinctions are unthinkable within the context of the usual empiricist account of cognition. There is no way, for example, of reducing Lotze's relating activities to the mere having of automatic transitional processes, or of reducing his second-order contents to faded and less forceful copies of impressions. On the other hand, these authors continue to interpret mental activities as purely inner psychological happenings, and they do not explicitly call into question the empiricist description of mind as a theatre of representations. Hence, their modifications of the Humean account do not constitute a full fledged revival of the premodern notion of cognition. None the less, once the distinction between activity and content had been re-established, and once the notion of irreducible second-order operations and contents had been elaborated, the stage was set for a comprehensive reappraisal of the modern thesis that the terminus of our knowing is located within the mind's inner space.

LOGICAL INVESTIGATIONS

Husserl was the first to challenge the modern position squarely. During the period from 1894 to 1900, further reflection on the incoherence of psychologism and on the need for a new foundation for logic led him to make a more decisive break with the modern epistemological model for mind. There is no evidence that he engaged during these years in any prolonged study of medieval or later scholastic literature on the topic of cognition, or that he was markedly influenced by a reading of the relevant texts of Aristotle. Yet he was able to achieve what amounts to a reconstruction of the premodern notion of the intentional continuity between mind and nature. His reflections during this period culminated in the publication of his greatest work, *Logical Investigations* (1900–1). This book begins with a series of prolegomena which make a powerful critique of the tenets of psychologism. The rest of the work develops a more positive account of how our cognitive acts have the capacity to yield access to objective truths. Its six investi-gations are devoted to the following related topics: signs and signification, universals and particulars, parts and wholes, logical grammar, intentionality, evidence and truth.

In the prolegomena, Husserl demonstrates the incoherence of trying to reduce the objectivity of numbers, propositions, and truth itself to subjective states or activities. Like Frege, he calls attention to the self-contradiction involved in every attempt to defend the thesis that truth is reducible to our acceptance of it. One cannot coherently propose a theory that subjectivizes truth and then go on to make objective claims for that theory. To make any statement whatsoever, including a statement in defence of relativism, is to make a claim that something is the case independently of one's making that claim. Like Frege, Husserl also contends that the principles of logic cannot be regarded as provisional generalizations because inductively derived laws could never serve as standards for adjudicating between valid and invalid arguments. It would make no sense to criticize some individual's thinking as illogical or inconsistent on the basis of inductive generalizations about how thinking occurs. The idiosyncratic thinking in question might legitimately be characterized as unusual, but not as invalid. Husserl holds that psychologism also fails to account for the kind of evidence belonging to principles of logic, such as the laws of the syllogism. He criticizes John Stuart Mill's description of logical laws as inductive generalizations on the grounds that the evidence for logical laws is absolutely certain rather than merely probable and provisional ([1.35], 187–96). This sort of argument would be unacceptable to Frege, who insisted that any appeal to evidence blurs the distinction between a proposition's truth and its being recognized as true. According to Frege, a proposition is simply true or false in itself. He argued that genetic accounts of how people come to think of propositions as true are irrelevant to the issue of truth ([1.64], vi; [1.66], 133; [1.86], 32–8). Husserl contends, on the contrary, that there is no reason why an appeal to evidence should email the reduction of truth to its recognition. When the objective truth of a proposition makes itself manifest to the seeker of truth, it does not thereby become subjective.

The first investigation opens with a discussion of two kinds of signs: indications and expressions. Indications either stand for what they signify (a flag as the sign of a nation) or point to the existence of some absent reality (smoke as a sign of fire). In both cases, association provides the link between sign and signified. As opposed to indications, linguistic expressions introduce a stratum of meaning. Their use requires acts of interpretation on the part of speakers and listeners. A speaker's words ordinarily

accomplish three functions: they express meanings, refer to objects, and 'intimate' to a listener the intellectual activity of the speaker. Husserl observes that the 'intimating' function of expression is a kind of indication, in the sense that spoken or written words are indices of the existence of the speaker's hidden and therefore 'absent' thoughts. He adds that many philosophical errors arise from the failure to distinguish properly between indication and expression. He takes Mill's account of naming as an example. Mill held that proper names denote but do not connote. They point to an object without in any way presenting or conveying information about the object. Proper names, he added, are like the distinctive chalk-marks made by the robber (of a popular tale) on a house that he intended to plunder at a later hour. Husserl observes that this comparison unfortunately suggests that proper names function only as indications. It is true that when the robber later sees the chalk-marks, he recalls by association his earlier thought 'This is the house I must rob'. But in relation to its object a name does not function as an indication or signal. An indication always motivates belief in the existence of whatever it indicates. However, a names does not similarly entail the existence of the object named ([1.35], 295–8). Named objects may be real, ideal, imaginary or even impossible. Thus, meaningful reference to an object does not perforce entail the existence of the object. The context of its use determines the kind of ontological commitment entailed by a linguistic expression. Husserl thus elegantly avoids the paradoxes that Bertrand Russell later discovered were implicit in Mill's view that names are like purely indexical signs.

The second investigation makes a convincing critique of the empiricist reduction of universals to blurred particulars. Husserl contends that recognition of some particular feature requires a grasp of the primitive relationship between species and instances. We could not discern a distinctive particular feature as such (e.g., this particular red) if we did not also intuit the corresponding universal (the species, Red). The two modes of intuition are interdependent. We grasp the particular feature as an instance of a range of similar instances in which the species is realized, and we grasp the identity of the species as the condition for the possibility of identifying the particular as such an instance.

The third investigation deals with the relationships between parts and wholes. Husserl first distinguishes between independent parts, or 'pieces', and non-independent parts, or 'moments'. Pieces are parts that are separable from their wholes. Moments are parts that are so interrelated with one another, or with their wholes, that they cannot be given separately. We learn to recognize the various relationships between parts and wholes by attempting successfully or unsuccessfully to vary these relationships in imagination. For example, we may conclude that the colour of a thing is inseparable from its surface (or extension) because we cannot successfully imagine eliminating one without also eliminating the other.

The fourth investigation discusses the relationship between grammar and logic. Husserl contends that grammatical laws governing distinctions between complete and incomplete expressions, and senseless and absurd expressions, are grounded in ontological structures. Laws governing the compounding of meanings are also similarly grounded in the way things are. All such rules have their origins in the interplay of parts and wholes given in perception. Husserl acknowledges that various languages may organize perceptual part-whole complexes differently. He suggests, however, that a study of the different ways in which various languages accomplish this task will reveal common categorial structures

concealed by empirical differences ([1.35], 526; [1.100], 206).

In the fifth investigation, Husserl objects to the above-mentioned expressions that Brentano had used to describe the status of intentional objects ('immanent objectivity', 'intentional in-existence'). He points out that these phrases suggest that the intentional object enters into consciousness as a component of the flux of experience and that it functions within the enclosure of the mind as a substitute for the object of reference. Husserl insists, on the contrary, that the intentional object and the object of reference are one and the same: 'It need only be said to be acknowledged that the intentional object of a presentation is the same as its actual object…it is absurd to distinguish between them' ([1.35], 595). He thus affirms unequivocally that our intentional acts target things in the world. Husserl also clarifies the relationship between intentional contents and intentional objects. He says that the term 'intentional content' may legitimately be interpreted in the following ways: (1) as the intentional object (either the object *tout court,* or the object considered as it is intended); (2) as that feature (the act's 'matter') in virtue of which the act achieves determinate reference; (3) as the 'intentional essence' of the act, i.e., the 'matter' combined with its 'quality'. The term 'quality' refers in this context to the type of intentional act, e.g., question, wish, statement, etc. ([1.35], 578–80, 589, 657; [1.54], 26–36). These distinctions are consistent with Husserl's claim, in the first investigation, that propositions are related to the acts in which they are expressed in a manner comparable to the way in which species are related to their instances. Considered as an intentional essence, the intentional content (matter and quality) is an ideal proposition that is independent of particular intentional acts. Taken as instantiated, the matter and quality are non-independent 'moments' of a particular act ([1.35], 330).

Many commentators have rejected this thesis on the grounds that it seems to commit Husserl to the questionable view that ideal propositions may somehow be particularized as moments of individualintentional acts. John Drummond has called attention to two passages that suggest that Husserl eventually modified his position. A note in the second edition (1913) strongly implies that the intentional content should not be regarded as a particularized feature of the intentional act ([1.35], 576; [1.54], 26–36, 39–42). Moreover, in *Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy* (1913), Husserl adds that what he had formerly taken to be a property of acts was really a property of the 'meant as such' ([1.41], 308; [1.54], 41). In other words, Husserl finally identifies intentional matter and intentional object (in the sense of the 'object considered as it is intended'). This is an important statement, for it effectively eliminates any residue of the medieval notion that we must postulate some son of intermediary content in between intentional acts and their objects.

Husserl agrees with Brentano that we must distinguish between predication and judgmental assent. However, he disagrees with Brentano's view that judgment is the acceptance or rejection of a neutralized presentation. According to Husserl, judgment is an assertive attitude which pervades the achievement of predication. This attitude is determined by anticipated or concomitantly experienced intuitions of things and their features, rather than by some sort of appraisal of the sense of the sentence. Husserl also agrees with Frege, as opposed to Brentano, that judgment is always a positive attitude, even when the content to which it assents includes a negation. In the context of discourse, assertoric statements make truth claims by reason of their form, not by reason of their

predicative content as such, nor by reason of some tacit prefixed existential proposition ([1.35], 612–16). He thus firmly rejects the modern view that judgments are appraisals of nominalized propositional contents. In our straightforward dealings with the world, we are ordinarily preoccupied with things and their properties, rather than with what we are saying. Our speech is guided not by a scan of meanings but rather by anticipated or achieved intuitions of the essential structures of things. It follows that we need not postulate mediating structures (ideas or concepts) between words and things, nor do we need to speculate about a 'place' in which they dwell. To know something is simply to possess its form, to intuit it through its essence, i.e., its intelligible structure. Speech acts express meanings as ideal objects, but meanings are not grasped as such in the instance of articulation.

Husserl also develops more in detail the guiding metaphor of his account of intentionality. He contrasts the 'emptiness' of symbolic intentions with the 'fullness' of intuitive presentations. An empty act is directed toward an object in its absence. A fulfilling act registers its presence. Symbolic intentions may be either nominal (simple) or propositional (complex). A nominal act is single-rayed and directed towards a whole. A propositional act is multi-rayed, since it articulates discrete parts within a complex object. Intuitive presentations may be either perceptual or categorial.

These distinctions prepare the way for a discussion of truth in the sixth investigation. According to Husserl, the experience of truth occurs when we recognize the identity of an object in the transition from empty intention to fulfilling intuition ([1.35], 621–4, 765–70). This description displaces the problem of truth from its traditional locus in the judgment, since the identity-synthesis may occur both in nominal and propositional contexts. Truth is achieved on the pre-predicative level in the identity-synthesis of an empty nominal intention and its correlative perceptual intuition. If judgments achieve truth in a comparable sense, it is not by reason of their propositional structure but by reason of a parallel intuitive fulfillment of their emptily intended objects ([1.76], 68).

The sixth investigation also offers a more extensive critique of the restrictive account of intuition proposed by British empiricism. Husserl approaches this issue indirectly by first criticizing the interpretation that the empiricist tradition had given to the role of those components of a proposition that belong to its categorial form, e.g., prepositions, conjunctions, cases and the copula. According to Locke and Hume, these syntactical operators refer to intra-mental processes rather than to aspects of the world. Husserl dismisses this thesis on the grounds that, when we use such expressions, we are directed towards things rather than towards inner processes. For example, if we say 'This paper is white', it is because we find that the property 'white' belongs to the paper. Hence we surely use the term 'is' in such a sentence to refer to the objective situation rather than to some inner psychological happening. Besides syntactical terms, he adds, there are other formal components of propositions that cannot find their fulfillment in ordinary simple intuitions. Nouns, verbs and even adjectival expressions introduce senses which cannot be fulfilled by simple intuitions: 'The intention of the word "white" only partially coincides with the colour-aspect of the appearing object; a surplus of meaning remains over, a form which finds nothing in the appearance itself to confirm it' ([1.35], 775). Husserl concludes that we must acknowledge the role of nonsensuous or 'categorial' intuitions which function in conjunction with simple perceptions and which bring the

formal components of predication to intuitive fulfillment. The fulfilling intuition of any expression describing a particular thus involves the intuition of formal senses that exceed what is intuited in the simple perception of the particular. These expressions refer to particular things by way of accidental or essential descriptive features whose surplus senses function as conditions for the manifestation of the particulars as such ([1.114], 70–1). Categorial intuition is therefore the first step in the process of discernment of essences, for to grasp the essence of some thing or situation is first of all to grasp its sortal property, i.e., its specific form. Translated into Aristotelian terms, intuition of the looks of things (secondary substances) is the condition for the presentation of particulars (primary substances).

THE TRANSCENDENTAL TURN

During the period from 1900 to 1913, Husserl developed more fully his criticism of the modern account of cognition. He spelled out his new position in a series of five lectures which introduce the theme of transcendental phenomenology for the first time. Given in Göttingen in 1907 and later published as *The Idea of Phenomenology,* these lectures are devoted to a clarification of the notions of immanence and transcendence. According to Husserl, modern descriptions of the relationship between immanence and transcendence tend to invoke two complementary themes: inside versus outside and accessibility versus inaccessibility. When immanence is described as an enclosure containing mental processes and impressions, transcendence is correspondingly defined as whatever remains outside of that enclosure. When immanence is described as a region of indubitable givenness, transcendence is defined as a region populated by unknowable things-in-themselves. Most epistemologies combine these two senses of the relationship between immanence and transcendence. They first conflate mental acts and their contents by describing both as 'contained' within the mind's psychic processes. They then construe the enigma of cognition as a problem of how to establish a connection between intra-mental representations and extra-mental things. The 'unspoken assumption' of these theories is that our cognitive processes are devoid of intentional import. This, according to Husserl, is the 'fatal mistake' of modern philosophy. Husserl praises Hume for acknowledging that this way of formulating the problem would in the end lead only to scepticism, but he adds that Hume's scepticism is itself riddled with contradictions. On the one hand, Hume degrades to the status of fictions everything that transcends impressions and ideas. On the other hand, he ascribes to the processes of mind the same sort of reality as the transcendent things that we would reach if we could somehow break out of the circle of immanence. Husserl concludes that whenever philosophers ask about the possibility of cognition in a way that implies that 'cognition is a thing apart from its object', or that 'cognition is given but the object of cognition is not given', they introduce an inappropriate notion of transcendence, which in turn entails an inappropriate interpretation of immanence ([1.34], 27–30).

According to Husserl, philosophy needs to adopt a new way of thinking and a new critique of reason: 'philosophy lies in a wholly new dimension. It needs an entirely new point of departure and an entirely new method distinguishing it in principle from any

"natural" science' ([1.34], 19). He therefore proposes a new and radical method which requires the bracketing *(epoche)* or suspension of natural convictions: 'At the outset of the critique of cognition the entire world of nature, physical and psychological, as well as one's own human self together with all the sciences which have to do with these objective matters, *are put into question'* ([1.34], 22). Husserl immediately distinguishes his new method from Descartes' doubt. Descartes' goal was to establish certitude about the existence of the thinking self and transcendent things. Husserl has no interest in such a project. His goal is simply to uncover the essence of cognition. He points out that Descartes failed to grasp the essence of cognition because he defined himself, *qua,* inquirer, as a 'thinking thing' having the same status as the transcendent *things* whose existence he had called into doubt ([1.34], 5–7). The purpose of the new method is to free us from this incoherent interpretation of transcendence, and consequently to enable us to redefine both transcendence and immanence. When we bracket everything within the realm of transcendence (as it is understood by Descartes and Hume), we in fact exclude nothing more than the incoherent interpretation of transcendent being as a region situated beyond the range of our knowledge. In so far as the mind's 'inside' is interpreted as having the same sort of ontological status, it too must be bracketed. This approach permits us to redefine immanence, in a broader sense, as the zone of all manifestation, wherein both immanent objects (considered now, in a narrower sense, as reflectively intuited experiences) and their intentional correlates (transcendent things) appear to us. Immanent and transcendent objects are now distinguished in terms of their different styles of appearing, rather than by appeal to the difference between intra-mental appearance and extra-mental being.

In the first volume of *Ideas,* Husserl describes this broader field of immanence as a realm of transcendental consciousness. He distinguishes in this work between the 'natural attitude', in which we are preoccupied by things in the world, and the 'phenomenological attitude', in which we reflect on the intentions at work in the natural attitude and on the objective correlates of those intentions. We achieve the latter transcendental point of view by suspending our natural attitude of belief in the reality of things and the world. Husserl emphasizes once again that the purpose of this procedure is not to call natural convictions into doubt but rather to achieve a distance that will enable us to reflect upon them. He adds that the method may also be called 'reduction', for it 'leads back' from lived acts and attitudes to reflective consideration of those acts and attitudes. After the reduction, we no longer live in our intentions. We step back from them in order to reflect on them in their full concreteness. For example, we step back from our participation in the positing of things as real, but continue to maintain that positing as something upon which we reflect. We also maintain our contact with things. The same things in the world are still there for our consideration, but the change in focus initiated by the reduction now permits us to appreciate them precisely *as* intended objects. We now notice them as perceived, as judged, as posited, as doubted, as imagined. Husserl calls any object so considered a *noema,* and he calls the correlative intention a *noesis* ([1.41], 214; [1.54], 46–56, 256–7).

Many commentators equate the phenomenological reduction with the reflective turn of consciousness away from things and facts towards concepts and propositions. They contend that the purpose of the reduction is to orient philosophical analysis towards

semantic issues. Proponents of this view find striking similarities between Husserl's concept of the *noema* and Frege's concept of 'sense' *(Sinn)*. They hold that both Fregean senses and Husserlian noemata ordinarily serve as intermediaries between our linguistic expressions and their referents ([1.61], 680–7). Frege claimed that the sense conveyed by an expression shapes or determines its reference. Certain passages from *Ideas* seem to assign an analogous role to the noema. For example, in one passage Husserl speaks enigmatically of a 'determinable X' that functions as a centre for the noematic contents which present an object in diverse ways ([1.41], 313–14, 320–2). Proponents of the Fregean interpretation of the noema suggest that Husserl meant to say that the noematic 'X' functions like the sense conveyed by a demonstrative pronoun. It identifies the object of reference not through its properties but as the bearer of properties ([1.95], 195–219). On this interpretation, the role of the phenomenological reduction is to disclose the semantic entities through which intentional direction to objects is achieved.

Robert Sokolowski points out that this interpretation fails to take into account the later Husserl's remarks, in *Formal and Transcendental Logic* (1929), on the difference between the kind of reflection that yields access to propositions and the properly philosophical reflection made possible by the reduction ([1.31, 110–27; [1.100], 45–7). Husserl makes it clear in this work that there is nothing specifically philosophical about propositional reflection, i.e., the reflective turn away from the 'ontological' realms of things and facts towards the 'apophantic' realm of concepts and propositions. This shift in focus occurs quite naturally whenever we reflect on what we ourselves or others have said, in such a way as to take what has been said as a mere supposition or proposal, i.e., as a proposition. It also occurs regularly in the context of scientific inquiry. Scientific verification requires a constant oscillation between investigation of facts and reflection on propositions. Both ordinary and scientific forms of prepositional reflection take place within the natural attitude, and therefore do not require the phenomenological reduction as their condition.

What then is the difference between prepositional reflection and philosophical reflection? Prepositional reflection turns our attention from things and facts to concepts and propositions. Philosophical reflection focuses on the correlation between intentional acts and attitudes *(noeses)* and the ways in which things are presented *(noemata)*. It considers things and facts as the correlates of the attitude of straightforward involvement in the world, and it considers propositions as the correlates of the intentional attitude of prepositional reflection. We may therefore conclude that, for Husserl, the noema is simply the object itself, considered under the reduction *as* presented. It follows that the 'determinable X' is not a semantic entity that functions as a medium of reference. It is the intentional object itself considered as an identity genuinely given in each of its presentations ([1.54], 181–91).

Husserl's description of the relationship between the ontological and apophantic domains reinforces his thesis that concepts and propositions do not function as mental intermediaries. Concepts and propositions emerge only when we shift from an ontological to an apophantic focus. Hence, they do not serve as mediating entities that somehow link speech acts to their intentional referents. As we have seen, Husserl explicitly rejected Locke's view that concepts are mental representations, and implicitly rejected the medieval view that concepts are transparent media of reference. Moreover,

he never claimed, as does Frege, that concepts and propositions belong to a 'third realm' (the first realm is the outer world of physical things; the second realm is the inner world of psychic processes) that functions as a non-subjective medium of reference. Robert Sokolowski suggests that the tendency to regard concepts and propositions as reified intermediaries is probably due to a confusion between object-oriented and reflective stances of consciousness. We enjoy a marginal awareness of what we are saying in the process of saying it. However, we do not at that moment objectify what we are saying as a proposition, for our consciousness remains directed towards the world. We can, none the less, easily shift back and forth between ontological and prepositional attitudes. The very mobility of our consciousness inculcates a forgetfulness of the change in attitude requisite for the manifestation of concepts and propositions. Concepts and propositions then easily come to be thought of as having a status analogous to things and facts. We thus come to think of them as separate entities situated in some psychic or semantic realm. For those who are looking for a solution to the modern epistemological problem of establishing a link between our speech acts and their targets, it is then perfectly natural to assign this mediating role to concepts and propositions. According to Husserl, however, there is no such need for mediation. Our consciousness is intentional by its very nature ([1.101],110–11; [1.106], 451–63).

This does not mean, of course, that there is no mediating role for language. Husserl draws a distinction between genuinely thoughtful speech and routine linguistic performances. He observes that when we speak, we ordinarily focus upon what we see, or anticipate seeing, and only marginally upon what we are saying. Though marginal, our consciousness of the meanings of linguistic expressions testifies to a familiarity with a vast network of culturally established distinctions and nuances whose ultimate justification lies in the intuitive disclosure of the looks of things. Once in command of the standardized senses of words, we need no longer focus on those senses. When we speak about things, we let ourselves be guided only by our categorial intuitions. Our choice of words is governed directly by the looks of the things we struggle to describe. Sometimes we simply repeat standard formulae. We then fail to exercise the potential for clarity or distinctness provided by the linguistic code. Sometimes we are more conscious of making linguistic choices. At such moments, we shift our focus away from things towards the senses of words ([1.31], 56–60). Husserl thus suggests that our ability to shift back and forth easily between these orientations accounts for the interdependence of intuitive and linguistic discriminations. Finding the appropriate word, therefore, is not just a matter of familiarity with the rules of a language-game. An exclusively pragmatic account of linguistic use amounts to a nominalism that rejects any link between predicates and the intuited forms of things. Thoughtful speech is the product of an artful integration of seeing and saying. Mastery of an extensive linguistic repertoire makes for more nuanced perceptions, which in turn call for more nuanced linguistic options.

In the first volume of *Ideas,* Husserl takes up again the effort to redefine the notions of immanence and transcendence. He attempts to bring the reader gradually to the realization that the new dimension revealed by the reduction is not a region comparable to other regions of being. He first defines a region of being as a specific domain of objects (e.g., the regions 'material thing' and 'culture') whose unity is determined by some maximally broad genus. He notes that empirical sciences which deal with a given

region of being ought to be grounded in a corresponding science of essences which he calls a 'regional ontology'. The task of a regional ontology is to specify the essences that structure all objects in its domain, and to spell out the hierarchically ordered relationships between them. In addition to the various regional ontologies, Husserl proposes that there should be a new science, called 'formal ontology', devoted to the study of the fundamental categories that govern the relations and arrangements between objects in any region whatsoever. He then criticizes the thesis, common to most epistemological accounts, that consciousness is confined within a psychic region, opposed to the region of things. Whenever consciousness is described in this manner, there is a tendency, he argues, to reduce intentionality to representation within the enclosure of the mind. Repeating the themes developed earlier in *The Idea of Phenomenology,* he then describes the transcendence of things as a mode of givenness within immanence, now more broadly understood as the range of intentionality's transcending power. He again stresses that the reduction does not exclude anything that is genuinely given. Finally, he points out that this new dimension of immanence cannot coherently be understood as situated within the co-ordinates of a pre-given world. Even the horizon of the world is given as such within the sphere of immanence. Unlike all other regions, therefore, the transcendental domain is absolute and all-inclusive. It has no perimeters, no outside. Husserl thus takes the metaphor of 'region' to its limits, in order to demonstrate that it is, in fact, incoherent to think of immanence as a sector within a broader whole. Any attempt to conceive of a dimension of being beyond the zone of possible consciousness is nonsensical. Consciousness and being belong together. Their ranges are co-extensive. There can be no outside for a being whose mode of being is to be open to all things.

EGO AND WORLD

One of the most controversial theses of Husserl's transcendental phenomenology is his claim that both ego and world may be considered as noemata by the transcendental inquirer. He frequently distinguishes between the ego considered as part of the world and the transcendental ego for whom the world itself is a *noema*. He contends that our capacity to function as transcendental subjects permits us to achieve a reflective distance from our own natural way of being in the world, and therefore to understand that way of being more fully. Husserl develops these themes in *Ideas II, Cartesian Meditations,* and in a manuscript published posthumously under the title *The Crisis of European Sciences and Transcendental Phenomenology*.

I*deas II* introduces the theme of the human ego in an oblique fashion by first describing the role of corporeal orientation and intellectual perspective in the presentation of things. Things appear to us in quite different ways, depending on the condition of our sense organs, on variations in our kinesthetic orientation, and especially on whether we take a pragmatic or theoretical attitude towards them. Husserl situates his analysis within the context of an understanding of nature that has been substantially affected by modern science. The contemporary sense of nature, he contends, is the intentional correlate of an attitude which he describes as both 'doxic' and 'theoretical'. It is doxic because it is permeated by an unthematic belief in the existence of its objects; it is theoretical because

it prescinds from the practical, aesthetic and ethical features of its objects. While ordinary experience does not constantly maintain an exclusively theoretical stance, none the less the influence of science has generated the everyday conviction that the true sense of the thing is what remains when we bracket the useful, the beautiful and the good ([1.5], 1–11; [1.89], 39–40). Further analysis of the presentation of things reveals that the full sense of their objectivity is dependent upon a recognition of intersubjectivity. For example, a sense of relatively fixed spatial positions is essential to our sense of objectivity. It would surely be difficult to develop this notion from an exclusively private perspective. We manage eventually to locate ourselves within a public system of co-ordinates by first recognizing that one individual's 'here' may be another's 'there', and then agreeing upon some convention for relating all positions to a stable network of places. This is a typical example of phenomenological analysis. Husserl's goal is always to unpack the layers of meaning sedimented in the senses of various types of objects, and thus to reveal the intentional acts and attitudes tacitly at work in the presentation of these objects.

In *Cartesian Meditations* (1931), Husserl continues his analysis of intersubjectivity by introducing a modification of the bracketing technique that he calls 'reduction to the sphere of ownness'. He proposes to abstract from everything in our experience that testifies to the presence of others. The purpose of this strategy is not to describe the production of meaning by a subjectivity actually cut off from others and the world, or to assure us that we are really in contact with other people. Despite its title, *Cartesian Meditations* is not motivated by any such epistemological concern. On the contrary, Husserl's purpose is simply to uncover the contribution of the sense that there are other selves to the individual's sense of self and of world. Phenomenological analysis is a reconstruction, not a creation of meaning.

In his *Lectures on the Phenomenology of Inner Time-Consciousness* (1928), Husserl claims that a second-order reflection reveals a level of time-consciousness that accounts for the identity of the transcendental ego. He first distinguishes between transcendent temporal objects, such as musical performances or public lectures, and immanent temporal objects, such as our perceptions of these events. He then points out that the perception of a temporal object may itself be taken as temporal object. Whenever we perceive the elapsing of a speaker's words into the past, we also experience the fading of our perceptions of those words into the past. We thus learn to situate transcendent happenings within the context of objective time, and also to locate our perceptions of those events within the horizon of immanent time. Finally, he claims that reflection on the correlation between the flux of immanent temporal objects and our experience of that flux reveals that we are conscious of a deeper level of time which accounts for our sense of the temporal flow of our intentional acts. We experience this primal flux as the basic form within which all experience occurs. This form is composed not of the basic temporal phases (past, present and future), but of the conditions for their possibility, i.e., a primal impression, 'retention' of the just-past, and 'protention' of the just-about-to-be. Awareness of the concatenation of these components makes it possible for us to experience our own intentional life as temporal, and to grasp intentional objects as the same again throughout their successive presentations ([1.14], 378–82; [1.46], 298–326; [1.100], 138–68).

ESSENCES

Husserl claims that we are sometimes able to discern the essential structures of things. In *Experience and Judgment,* he distinguishes between the grasp of empirical universals and the fully-fledged intuition of essences. A preliminary awareness of empirical universals occurs when we make the transition from merely associative judgments, which express perceived likenesses among things, to those judgments which explicitly identify particulars as instances of some category. Once we have discerned what is the same among many individuals, we may then thematize the universal itself and begin to make scientific judgments about it. The goal of science is to specify ever more completely the characteristics of such empirical universals. According to Husserl, however, science never fully realizes this ideal, for it is impossible to achieve a truly exhaustive and definitive determination of all of the features of any empirical universal. The determination of every empirical concept is 'always in progress, always being further fashioned, and also refashioned' ([1.35], 116; [1.36], nos 80–98; [1.100], 58–62).

We make the transition from the grasp of an empirical universal to the intuition of an essence when we move from the perceptual to the imaginary mode of consciousness by submitting the universal to a process of 'free variation' designed to reveal an invariant structure. Husserl describes this technique as follows. We attempt to imagine successively the subtraction of one after another of the various features of the object under consideration. In this way we eventually isolate those invariant features without which the object in question wouldcease to be what it is. We need not consider every conceivable variation. Indeed, in most cases it would be impossible to carry out an exhaustive survey of every possibility. What matters is that the manner of variation should be such that not only do we have the sense that the process could go on indefinitely, but also that it would in fact be fruitless to continue. As Husserl puts it, the process of variation should have a character of 'exemplary arbitrariness' ([1.36], no. 87b). Eidetic intuition is therefore a product of method. As Husserl puts it: 'The inward evidence on which all knowledge ultimately reposes is no gift of nature, appearing together with the idea of states of affairs without any methodically artful set-up' ([1.35], 63; [1.110].

Husserl does not, like some contemporary philosophers, extend the method of free variation to the consideration of improbable scenarios imagined as taking place within possible worlds. His imaginative variations, like Aristotle's, are generally guided and limited by our ordinary intuitions of things in this world. Moreover, he never attempts to provide anything like a clear-cut rule for deciding when the process of 'free variation' ought to come to an end. He tells us only that there comes a point in any enquiry when it is reasonable to conclude that there are no further pertinent questions to be asked. It is then imprudent or even pathological to consider additional alternative possibilities. In short, discernment of essences requires both method and judgment. A sense of the mean between extremes is as necessary in intellectual enquiry as it is in practical affairs.

Husserl claims, moreover, that the kind of certainty that we should assign to the results of this procedure varies in proportion to the type of access that we have to the objects

under investigation. Our apperceptive access to the basic structures of consciousness yields a different son of evidence than is available in our perceptions of things in the world. Ordinary perceptions are perspectival and therefore necessarily incomplete. However, the philosophic recognition that all such perceptions are perspectival is not itself perspectival or incomplete in the same fashion. Ordinary perceptions are perspectives in the sense that they present only one side of their objects at a time. Philosophic descriptions of the structure of perception are 'perspectives' in the sense that they are influenced by historically conditioned questions and methods. Husserl suggests that it is just as inappropriate to blur these differences by asserting that all forms of cognition are similarly perspectival, as it is to look for mathematical certitudes in the ethical and political domains.

Husserl at first held that the relative immediacy of access to the structures of cognition provided by our tacit awareness of intentional performances makes for apodictic certainty. He eventually acknowledged, however, that even the privileged access of consciousness to its own structures does not guarantee the perfect accuracy of reflective descriptions of those structures. Given the oblique and unthematic character of our tacit awareness of intentional acts and attitudes, and given the distorting influence of prevalent philosophic categories, our reflective descriptions are often vague and confused. Indeed, the history of philosophy testifies convincingly to the fact that no philosophic reflection can dissipate all vagueness. In any case, Husserl adds, philosophic differences are never settled by sweeping refutations, but rather by the elaboration of strategic distinctions that reveal the partial, vague or confused character of opposing positions. This is why philosophy must be a co-operative effort of a community of investigators.

LIFE-WORLD AND HISTORY

Husserl's later works are largely devoted to the themes of life-world and history. He hoped that his phenomenological analyses of these topics would serve as correctives to the naturalism and historicism which he recognized as two of the most powerful themes of modernity. Naturalism is a philosophic position consequent upon the mathematization of nature achieved by the new scientific method at the beginning of the modern era. Its thesis is that the entire realm of nature, including human nature, is comprised only of entities and processes susceptible of such quantitative analysis. Historicism may be defined as the tendency to regard the conceptual systems of both the natural and the human sciences as world views whose presuppositions are determined by contingent historical transformations.

Husserl traces the drift of modern science towards reductionism to Galileo's failure to relate scientific truths adequately to their sources in the life-world, the pre-scientific world in which we live. He calls attention, in particular, to the ambiguous implications of Galileo's bold decision to overcome the obstacle which perceived qualities presented to calculative rationality by treating them as subjective indices of objective quantities. This decision had the effect of concealing the priority of perceived over mathematical objects. Husserl contends that two factors contributed to this concealment ([1.33], 21–60; [1.89], 162–7).

In the first place, he observes, we must not forget that Galileo was heir to a relatively advanced tradition of 'pure geometry', which by reason of its very advances had already lost contact with the fundamental insights on which it was first constructed. Geometry most likely had its origins in the invention of practical techniques of surveying and measuring. Its ideal figures were thus first derived by abstraction and progressive idealization from the perceived forms of things. Once having acquired the notion of a field of pure 'limit-shapes', mathematical praxis was able to achieve an exactness and a freedom that is denied to us in empirical praxis. This ideal geometry was subsequently translated into applied geometry in the field of astronomy, where it became possible to calculate 'with compelling necessity' the relative positions and even the existence of events that were never accessible to direct empirical measurement. This achievement constituted a partial fulfillment of the dream of the ancient Pythagoreans who had observed the functional dependency of the pitch of a tone on the length of a vibrating string which produced it, and had therefore evoked the possibility of a generalized theory of correlations between perceived properties and measurable changes in geometrical properties. All of this, Husserl speculates, inclined Galileo to bracket the problem of the original derivation of geometry from the perceived qualities of things, and to interpret such qualities as merely subjective indicators of the true quantitative being of the world ([1.33], 29).

In the second place, Husserl continues, we must take into account the 'portentous' influence on Galileo's thinking of the new algebraic formalization of geometry. The development of algebra in effect liberated geometry from all intuited actuality and even from the concept of number. Although it was only with Descartes' invention of analytic geometry that the full implications of this move would be realized, Galileo had already clearly understood that Euclid's geometry could now be interpreted as a general logic of discovery rather than as a theory limited to the realm of pure shapes ([1.33], 44–6). Husserl's argument may be confirmed by considering the role of Galileo's diagrams for his theorems about uniformly accelerated bodies. It is clear that the lines and angles of these diagrams no longer refer literally to spatial shapes created by geometric relations between linear magnitudes but rather to a sequence of ratios between time and velocity. Galileo therefore implicitly considered such 'geometric' diagrams as expressive of relationships among any magnitudes whatever. Although this realization contributed significantly to the advance of modern physics, it also initiated a process of further alienation of scientific method from its roots in the perceived world. Unlike traditional geometry, which requires insight into the reasons for every step in its demonstrations, algebra lends itself to the development of techniques of calculation which no longer demand such comprehension but require instead only the blind implementation of procedural rules.

Galileo himself continued to employ the more traditional geometrical style of demonstration, and hence demanded of his readers conscious insight into the point of each transition. Nevertheless, his method took modernity further along the road towards the reductionist interpretation of reason as an adaptive power whose operations are mechanistic processes devoid of intuitive insight. Husserl cites as an example of this account of reason the tendency of some twentieth-century logicians to conflate computing procedures with authentic deductions, and even to interpret the rules

governing such procedures as a genuine logic ([1.37], 117). He concludes that the great discovery of modernity, i.e., the emancipation of mathematics from the constraints imposed by the intuition of Euclidean shapes, was both an advance and a setback. On the one hand, freedom from servitude to intuited forms would give to the geometer a greater potential for mastery over nature. On the other hand, it also further promoted the modern forgetfulness of the priority of insight into perceived structures over technical virtuosity. This forgetfulness would eventually lead to a bracketing of those acts and attitudes of the human spirit that render scientific and other modes of cognition possible. Naturalism forgets the role of the inquiring subject whose intentional acts remain inaccessible to empirical observation.

Husserl calls attention to the irony implicit in this history of modernity. He observes that it is unlikely that Galileo was ever aware of the hidden 'motivation' of his project. The seeds of reductionism and even of scepticism were, of course, already present in Hobbes's rationalistic exaltation of the power of reckoning. Hobbes had dismissed the whole sphere of pre-scientific experience and discourse. Whatever cannot be quantified he assigned to the realm of illusion. Moreover, Hobbes clearly regarded reason's calculus as an outgrowth of our biological drives and needs. For a long time, however, the success of the new sciences obscured the implications of this naturalism. Hobbes thought that calculative procedures could succeed where the ancient and medieval quest for essences had failed. Reckoning would reveal the hidden structures of reality. It required a genius such as Hume, says Husserl, to take the naturalism initiated by Hobbes to its logical conclusions. Hume realized that if cognitive intuition cannot break out of the circle of impressions and ideas, there is no justification for supposing that reckoning can yield any less fanciful results. The fundamental categories requisite for a mathematicized version of nature must somehow be derivable from information provided by the manifold of impressions. According to Hobbes, however, sensory impressions yield only illusions. It follows that scientific theories too are productions of fancy. This realization is the key to Hume's scepticism: 'Hume goes on to the end. All categories of objectivity—the scientific ones through which an objective extra-psychic world is thought in scientific life, and the pre-scientific ones through which it is thought in everyday life—are fictions' ([1.33], no. 23). Scientific descriptions are useful fictions, but they nevertheless remain fictions. The high hopes of modernity thus culminated finally in a thoroughgoing pragmatism. It seems clear in retrospect that the hidden intent of Galileo's fatefuldecision, and indeed of the entire project of modernity, was to give up on truth and settle for power.

Husserl therefore thought that the most urgent task of philosophy was to restore confidence in the rationality of our ordinary intuitions about the life-world. We must demonstrate how scientific accounts of nature are always dependent upon the evidences of ordinary experience, and show how the success of Galileo's method in some areas does not justify an unlimited application in all fields of enquiry. Phenomenological analysis reveals, for example, that human acts have a conscious dimension that cannot be reduced to quantifiable processes, or explained as a product of causal sequences. This is especially true of the procedures of scientific discovery which require a disciplined detachment from biological needs and environmental stimuli. In short, the acts prerequisite for the emergence of things as empirical objects cannot coherently be taken

as exclusively empirical processes.

Husserl also makes some interesting remarks on the implications of his own method of historical interpretation, as exemplified in the above analysis of the unintended project concealed by Galileo's manifest intentions and accomplishments. He observes that whenever we engage in an historical analysis of this type we always find ourselves in a sort of circle. We can only understand the past in the light of the present, and yet the present has meaning only in the light of the past. 'Relative clarification' in one direction brings about 'some elucidation' in the other, and vice versa. There is no tone of pessimism in Husserl's description of this methodological predicament ([1.33], 58). He suggests that his 'zigzag' method of historical interpretation makes it possible to achieve ever more comprehensive historical understanding, but he never claims that it will yield definitive truths. He does not lament this situation. He simply calls attention to the kind of truth that is available to historical interpretation.

These remarks suggest that, in his later works at least, Husserl was sensitive to the hermeneutic circle implicit in all human enquiry. His comments on the historicity of the life-world confirm this impression. Although he sometimes describes the life-world as a horizon of experience common to human beings in every historical epoch, at other times he speaks of multiple life-worlds and hints that every life-world is conditioned by layered sedimentations of meaning produced by forgotten cultural achievements. He even goes so far as to say that we must look for truth 'not as falsely absolutized, but rather, in each case, as within its horizons' ([1.20], 279). This passage suggests that all evidence is subject to correction by further evidence. Husserl adds, moreover, that it is in accordance with the nature of a horizon that 'it leaves open the possibility that conflicting experiences may supervene and lead to corrections in the form of a determining as otherwise or else in the form of a complete striking out (as illusion)' ([1.20], 281; [1.110], 50).

Husserl's reflections on these issues did not cause him to repudiate the original project of phenomenology. Indeed, in the same passages which call attention to the role of intentional horizons he constantly reaffirms the phenomenological goal of uncovering and 'explicating' the sedimented senses of these horizons. Husserl therefore apparently saw no conflict between this goal and his properly hermeneutic discovery that all inquiry takes place within an historical context. Jacques Derrida contends that this attitude indicates that the entire enterprise of phenomenology was founded on an uncontrolled presupposition. Husserl tacitly took for granted the trans-historical validity of the ideal of universal truth, even though his own historical interpretation established that commitment to this ideal is an historically conditioned attitude. His description of this ideal as a regulative idea effectively exempted him from the task of justifying it ([1.51], 154). It seems more likely, however, that Husserl always understood that the ideal of universal truth functions more as a moral imperative than as a demonstrable or self-evident principle. He was convinced that our experience of the world yields enough intelligibility and direction to encourage the expectation that further investigation will yield further progress in truth. However, his choice of the Kantian notion of a regulative idea to describe the telos of philosophy suggests that he regarded the expectation of progress in truth as a postulate of rationality rather than as a metaphysical principle.

CHAPTER 2
Philosophy of existence 1

Heidegger

Jacques Taminiaux

At the very outset and up to the end, the long philosophical journey of Martin Heidegger (1889–1976) remained oriented by a single question, the question of Being, the *Seinsfrage*. This does not mean, however, that the question preserved the same meaning or ruled an identical field of investigation throughout the whole journey. Indeed, Heidegger himself repeatedly claimed that at some point a turn *(Kehre)* occurred in his thought. Moreover, thanks to the current publication of his entire *corpus (Gesamtausgabe),* it is now possible to draw a fair picture of the vicissitudes of the journey. For the purpose of this chapter, I propose to divide Heidegger's work into two phases. The first covers publications and lecture courses devoted to setting out the project of what Heidegger, at that time, called 'fundamental ontology'. The later phase covers writings which are all characterized by a meditation on the history of Being. Whereas the project of fundamental ontology aimed at completing metaphysics as the science of Being, the later meditation consistently aimed at overcoming metaphysics.

FUNDAMENTAL ONTOLOGY

After a few years of study in theology the young Heidegger, who first wanted to become a Catholic priest, had decided for reasons both personal and theoretical to dedicate his life to philosophy.

At the turn of the century, the burning area for philosophical research in Germany was logic. Two major trends were in conflict as far as the approach to the basic problems of epistemology and the philosophy of science is concerned. On the one hand under the influence of British empiricism, John Stuart Mill predominantly, many German scholars in those fields were convinced that the foundations of knowledge in general were strictly empirical. Accordingly they were looking for the roots of all cognitive principles in observable facts such as those which are investigated by psychology taken as an empirical science. On the other hand, in a reaction against empiricism, several scholars were attempting to revive in the disciplines at stake the transcendental orientation of Kant's criticism. In the history of ideas this conflict is known as the quarrel about *psychologism* between empiricism and transcendentalism. Whereas the former claims that thinking and knowing are a matter of facts occuring in the mind, the latter claims that thought and knowledge, however much they may depend on facts, could not exist without the help of a transcendental *cogito*. In 1900–1 a book appeared which had a decisive

influence in the quarrel: Edmund Husserl's *Logical Investigations*. Like neo-Kantianism, the book was a refutation of all empiricist reductionism. But unlike neo-Kantianism it vindicated a new and original method which was altogether intuitive and a priori: phenomenology.

Heidegger's early writings were contributions to the new phenomenological trend. His doctoral dissertation (1914) was entitled *The Doctrine of Judgment in Psychologism*. His *Habilitationsschrift* (1916), *The Theory of Categories and Meaning in Duns Scotus* was inspired by Husserl's idea of a pure a priori grammar. Heidegger's genuine project emerged after these academic exercises, when he came to realize that he was less interested in logic for its own sake than in the link between logic and ontology or even in the ontological foundation of the logical. Indeed he repeatedly claimed that the influence on him of the *Logical Investigations* was at that time on a footing with the impact of a book by one of Husserl's masters, Brentano's dissertation *On the Manifold Meaning of Being in Aristotle* (1862). Brentano showed that in Aristotle the Being of beings is expressed in at least four basic ways: as substance *(ousia),* as potentiality *(dunamis)* and actuality *(energeia),* as truth *(alētheia),* according to the categories such as quality, quantity, relation and so on. While meditating upon this manifoldness in the meanings of Being, Heidegger raised the following question: is there a unique focus of intelligibility which illuminates these various meanings, a common source for understanding them, and how and where is it to be found? Such is the *Seinsfrage,* the question of Being.

The reappropriation of Husserl and Aristotle

On the basis of his early dissertations, Heidegger was already convinced that the phenomenological method was to be his way to address the question. When he became Husserl's personal assistant at the University of Freiburg-im-Breisgau, thereby gaining the opportunity to become familiar with all aspects of phenomenological research, he came to realize that the work of his master provided him not only with a method but also with basic discoveries thanks to which he was able to transform his ontological question into a genuine field of investigation. On the basis of the posthumous publication of several drafts and lecture courses, it is now possible to draw a fair picture of Heidegger's early attempts to articulate his own field of ontological investigations thanks to a peculiar retrieval or reappropriation of both Aristotle and Husserl. It could even be demonstrated that Heidegger's project of fundamental ontology is the outcome of an overlapping of what he considered to be the basic discoveries of Husserl with what he took to be the basic discoveries of Aristotle. This means that, with the help of Husserl's teaching, Heidegger was able to find in Aristotle's teaching an authentic phenomenology while, with the help of Aristotle's teaching, he discovered the possibility of transforming phenomenology into a field of ontological investigation. This ontological overlapping of Aristotle and Husserl is already noticeable in the short manuscript *Phenomenological Interpretations of Aristotle* [2.27] that Heidegger wrote in the autumn of 1922 at the request of P.Natorp in order to support his application for a teaching position at the University of Marburg. The overlapping pervades the teaching of Heidegger from the time of his appointment at Marburg until the publication of *Being and Time*.

Heidegger credited Husserl with three basic discoveries useful for articulating his own

field of investigation. The first discovery is *intentionality*. According to Husserl, intentionality is the very structure of consciousness in all its modes (perception, imagination, conceptualization, judgment, reasoning and so on). In every form of consciousness there is a specific relatedness between a specific way of intending and a specific correlate which has its way of appearing *qua* intended. Already in the 1922 manuscript, Heidegger makes clear that for him this structural relatedness is much more than a basic feature of consciousness. It is the fundamental character of the very life of each human being. *De facto,* or factically, the life of an existing human being is essentially *related*. In Heidegger's language of that time, this means that such relatedness is an ontological character of 'factical life'. This is why he writes:

> the complete intentionality (the relatedness to, that towards which there is a relation, the accomplishment of the self-relating, the temporalism of it, the preservation of temporalisation) is nothing but the intentionality of the object which has the ontological character of factical life. Intentionality, merely taken as relatedness to, is the first phenomenal character, proximally noticeable of the fundamental mobility of life, that is of care. ([2.27], 17)

Whereas Husserl's discovery of intentionality was confined within the limits of a theory of consciousness, i.e., within the framework of a theory of knowledge, Heidegger's peculiar retrieval of the discovery results very early in another philosophical project aiming at an ontology of factical life, or of facticity. Along with this alteration, the new philosophical project entails an alteration in the very notion of logic. In Husserl, logic was another name for the theory of knowledge, i.e., of the basic categories making cognition possible. As a result of the shift from consciousness to factical life, logic becomes a name for the investigation of the ways in which factical life expresses and understands itself as a result of specific categories.

This second shift is at the core of Heidegger's reinterpretation of what he viewed as the second major discovery of Husserl, i.e., the doctrine of *categorial intuition*. According to this doctrine, the meaning of human discourse *(Rede)* depends on a complex set of structures, forms and basic concepts which are all of an ideal nature. In spite of the fact that, precisely because they are ideal, these idealities are in a position of excess or surplus *vis-à-vis* any sensuous content given to sensible perception, they are none the less, claims Husserl in the sixth *Logical Investigation,* offered to an intuition or insight that is no longer sensible, but ideal: the so-called *categorial intuition*.

Among the categorial intuitions mentioned by Husserl, one stood out as having a decisive relevance for the project to which Heidegger had subscribed from the outset: the problem of the *meaning of Being*. Indeed in the context of the sixth *Logical Investigation* Husserl was developing a twofold thesis about Being. First, he stated, in agreement with Kant, that 'Being is not a real predicate'. Second, he maintained, in contradistinction to Kant, that 'Being' is given to categorial intuition. Heidegger took advantage of this double thesis and transformed it for his own ontological purpose. 'Being is not a real predicate' meant for both Kant and Husserl that it is not to be found among the predicates which define the quiddity or *realitas* of beings: what they are. This thesis turned out to mean for Heidegger that Being is not in any sense a being. In other words the thesis

amounted to stating a difference between beings and Being, an ontico-ontological difference. Likewise, the thesis according to which 'Being' is given to a categorial intuition, which in Husserl was an element of his transcendental logic, turned out to mean for Heidegger that in its factical life the human being has an understanding of Being. In other words, factical life interprets itself in terms of Being. This is to say that the ontology of those factical beings who understand Being is an hermeneutics, or a theory of interpretation.

But, by the same token, Husserl's twofold thesis about Being, thus reappropriated in an ontological framework, induced Heidegger to search in the *de facto* life of the human being for the unique ground for an intelligibility of the various meanings of Being. It induced him to search for the focus of intelligibility within what he was to call, a little later, the human *Dasein*.

In this search, Heidegger availed himself of a third discovery made by Husserl: the discovery of the a priori, a word with an obvious temporal connotation. Husserl often claimed that time consciousness was the most fundamental consideration of his phenomenology. In order for consciousness to be intentional at all, it has to be temporal. This means for Husserl that in order to be able to intend any intentional correlate, consciousness has to be a 'living present', a present which constantly articulates the 'retention' of what is just past with the anticipation (or 'protention') of what is going to happen. Heidegger, who was to edit in 1928 Husserl's *The Phenomenology of Internal Time-consciousness,* took advantage of this third discovery. His ontology of human *Dasein* aims at demonstrating that temporality is the only horizon within which we understand the meanings of Being. This is condensed in the very title of his masterwork of 1927, *Being and Time* [2.2, 2.45], a book in which the three Husserlian discoveries operate in a peculiar way along with an Aristotelian inspiration. The link between this inspiration and Husserl's legacy is already noticeable in the fact that Heidegger, in his Introduction, characterizes the phenomenological method at work in the book by using the very language of Aristotle.

What Heidegger discovered very early, as he puts it in a later survey of his 'way to phenomenology' is that 'what occurs for the phenomenology of the acts of consciousness is thought more originally by Aristotle and in all Greek thinking and existence as *alētheia' (On Time and Being* [2.70], 78). In its traditional definition, truth is an adequation between the mind and the real, and it occurs in a specific place: the predicative judgment. In one way, Husserl's phenomenology contributed to overcoming the classical notion of truth. For Husserl indeed, prior to the so-called *adequatio intellectus ad rem* (of the mind to the thing), the touchstone of truth is *evidence,* i.e., the self-manifestation of the object *qua* phenomenon to intentionality. Moreover, Husserl claimed that the locus of truth is in no way restricted to the predicative judgment: it is intentionality itself, or consciousness in all its forms. Heidegger took advantage of this breakthrough in his phenomenological interpretation of Aristotle. As far as truth is concerned, the Greek philosopher, he claims, is more original than Husserl on two accounts: first because he understands truth as the unconceal-ment of beings for an unconcealing being, the human being; second because this unconcealing, instead of being restricted to consciousness, is attributed by him to the human comportment as such, more precisely to the human way of being. In other words, for Aristotle, claims Heidegger,

alētheia, or truth, is a matter of *bios,* of life or of existence. It is in the context of this phenomenological reading of Aristotle that Heidegger was led to replace the words 'factical life' by the key word *Dasein* in order to characterize the human way of being. In German the word is both a verb meaning 'to be present', or to exist, and a noun meaning 'presence', or existence. Moreover, *da* the prefix of the word, means both *there* and *then;* it points to a place and time for something to happen. Heidegger's use of the word to characterize the human way of being is an attempt to suggest that the concrete existence of a human being is a phenomenon which is *there,* thrown into a place and a time in which an unconcealment happens.

But in addition to a concept of truth in terms of existence, Heidegger also discovered in Aristotle a concrete analysis of human existence as an unconcealing way of being. The ontological reappropriation of Husserl's discovery of intentionality taught him that human existence as such is a *relatedness to*. The reappropriation of Husserl's discovery of categorial intuition taught him that human existence, in its relatedness to, understands Being. Likewise, the appropriation of Husserl's discovery of the a priori taught him that time is at the core of the understanding of Being. Since those three ontological reappropriations were oriented by a single question—where is the source for the understanding of Being to be found?—they all required an analysis of *Dasein* as the being who understands Being. In other words they required an analysis of *Dasein's* way of being, i.e., for an ontology of *Dasein*. And here Heidegger discovered very early that Aristotle's description of human comportment paved the way to the ontology of *Dasein* that he was attempting to articulate. His lecture courses of the Marburg period demonstrate that, in his view, the *Nicomachean Ethics* was such an ontology. It is in such terms that Heidegger deals with Aristotle's *Ethics* in the introduction to his celebrated lecture course of 1924–5 on Plato's *Sophist* [2.29], which had a deep influence on those who originally heard it, including Hannah Arendt, Hans-Georg Gadamer and Hans Jonas.

The *Nicomachean Ethics* scrutinizes the dianoetic excellences or intellectual virtues and establishes them in a hierarchy. According to Aristotle these virtues have two levels: the lower are the deliberative excellences, the higher are the epistemic excellences. At the lower level two deliberative virtues take place: *technē* and *phronēsis*. In Greek *technē* means art, in the sense of knowhow. Heidegger insists that in Aristotle *technē* is an intellectual excellence because it is a matter of truth, of *alētheia* as unconcealment. It is a peculiar way of disclosing, or discovering, what is required for a specific comportment: the productive comportment called *poiēsis*. In other words, it is a way of knowing truth, or even of being in truth, linked with a peculiar way of being: the production of such and such a work or result. However, claims Heidegger, the reason why Aristotle puts *technē* on the lowest rank among the deliberative excellences is to be understood in terms of an ontology of *Dasein.* Indeed, in the productive way of being which is ruled by *technē, Dasein* is busy with, and concerned by, products or results out there. To that extent the pair *technē-poiēsis* suffers an ontological deficiency. To be sure, the principle for the productive activity informed by an unconcealing knowhow is *within* the agent, hence within the *Dasein* and of the same nature as *Dasein* itself: it is the model conceived by the agent and held in view by him. But the telos or end of productive activity is in no way within *Dasein* or of its nature: it occurs *outside* of *Dasein*.

This ontological deficiency, claims Heidegger, is no longer the case in the second

deliberative excellence, namely *phronēsis,* also conceived by Aristotle as a peculiar way of disclosing, or of being in truth, adjusted to a specific comportment or active way of being. This active way of being is no longer *poiēsis* but *praxis,* i.e., action in the sense of the conduct by an individual of his or her own life. *Phronēsis* discloses to *Dasein* the potentiality of its own existence. Here again, according to Heidegger, the reason why Aristotle puts *phronēsis* on the highest level among the deliberative excellences is to be understood in terms of an ontology of *Dasein*. Indeed neither the principle of *phronēsis* nor its goal falls outside the human being. The principle here is a prior option of the *Dasein* for well-doing, while the end is the very way of being of *Dasein,* its own *praxis*. *Phronēsis* is nothing but the resoluteness to exist in the highest possible manner.

Thus understood in ontological terms, Aristotle's distinction between the *technē-poiēsis* and the *phronēsis-praxis* distinctions allowed Heidegger to set up the framework of his own ontology of *Dasein,* as a being who understands Being. This ontology, which was to be developed in *Being and Time,* describes the existence of *Dasein* in terms of a tension between an everyday way of Being in which the *Dasein* is not authentically who it is, and an authentic way of Being in which *Dasein* is properly itself. The description shows that in everydayness *Dasein* cannot be its ownmost Being, because it lives in a condition of preoccupation or concern for ends to be attained by a variety of means or tools, a condition which is enlightened by a specific circumspection about surroundings. To that extent everydayness is ruled by *Das Man,* the 'They'. In it everybody is nobody, because such a condition never confronts *Dasein's* own existence. This description is the outcome of a peculiar reappropriation of Aristotle's doctrine concerning *technē* and *poiēsis*. On the other hand, the analytic of *Dasein* shows that *Dasein* authentically becomes a Self by confronting its ownmost potentiality for Being. It does so by accepting existence in its finitude, as a Being-unto-death. This description, with the exception of the emphasis put on anxiety, is again the result of a peculiar reappropriation of Aristotle's analysis of *phronēsis* and *praxis*. Aristotle indeed insists that *phronēsis,* as a dianoetic virtue, has its proper realm in the perishable. On the other hand, Heidegger occasionally suggested when he was teaching Aristotle that the latter's concept of *phronēsis* somehow anticipates the notion of conscience *(Gewissen)*. And conscience in Heidegger's analytic of *Dasein* is the phenomenon in which *Dasein* listens to a call from it own depths summoning it to confront its finitude.

But the Aristotelian inspiration in Heidegger's ontology of *Dasein* is not restricted to *technē* and *phronēsis*. It also includes a peculiar reappropriation of Aristotle's doctrine of the epistemic virtues. In the *Nicomachean Ethics* these virtues are *epistēmē* (science) and *sophia* (wisdom). Both are adjusted to *theoria,* i.e., to a purely contemplative attitude, which bears upon a realm which is no longer perishable, a realm which is forever what it is and how it is. For Aristotle that realm is higher than the realm of human affairs precisely because it is not perishable as they are. And in his view it is at this level only, specifically at the level of *sophia,* that a true concern with Being can take place, as a contemplation of the ontological structure of the totality of beings and of the prime mover which is the principle for all movements of *physis* (nature). Heidegger insists, in his Marburg lectures, that, according to Aristotle, the contemplation of that immutable realm is the most authentic way of being that a mortal can attain, because as long as such contemplation lasts, the mortal spectator lives in the proximity of the divine.

According to Heidegger's teaching in the Marburg period, there is in the Aristotelian concept of *sophia* an equivocation between ontology as the science of the Being of beings and theology as the science of the divine. There is also an indeterminacy, because for Aristotle the only meaning of Being is limited to what he calls *ousia,* i.e., in Heidegger's interpretation, presence in the sense of presence-at-hand *(Vorhandenheit)*. This meaning of Being, Heidegger says, is adjusted to nature, but it is not relevant as far as the Being of *Dasein* is concerned. Moreover, considering presence as the only meaning of Being amounts to understanding Being in the light of a temporality in which only the present is important. This temporality, considered as a succession of present moments, is in fact the concept of time that Aristotle develops in his *Physics*. Heidegger raised objections to the predominance of this concept. In the case of the Being of *Dasein,* putting the emphasis only on the present is one-sided and misleading. In order for *Dasein* to be authentically present, it has to retrieve who it was as thrown in its own Being as well as to anticipate its own end. Whereas the temporality of nature is ruled by the exclusive privilege of the present, the temporality of *Dasein* not only is determined by a triad, in which three *ec-stasis*—past, present, and future—co-operate, but also is ruled by the privilege of the future.

Accordingly, Heidegger, who agrees with Aristotle in considering the contemplation *(theoria)* of Being as the authentic accomplishment of *Dasein,* reorients that contemplation exclusively towards the finite being of *Dasein* and its finite temporality. As a result, fundamental ontology claims to be able to overcome both the onto-theological equivocation and the ontological indeterminacy which characterized the ancient ontology and its legacy. The overcoming includes a deconstruction *(Destruktion)* of the ancient concepts along with a reversal of the old hierarchy between the perishable and the immutable. This deconstruction aims at demonstrating that for the most part the basic concepts of ancient philosophy and consequently of the entire western tradition of metaphysics—concepts such as matter *(hulē)* and form *(morphē),* potentiality *(dunamis)* and actuality *(energeia),* idea *(eidos),* substance *(hupokeimenon),* and so on—find their phenomenal origin in the activity of production, an activity which in order to be possible at all presupposes the permanence of nature, and liberates its products from their link to the producer to bestow on them a permanence similar to the natural one. Consequently these ontological concepts, instead of being coined after the authentic ontological experience that *Dasein* has of its own Being, were coined in the inauthentic framework of everydayness. In such a framework *Dasein,* while coping with entities which are ready-to-hand, pays attention to a meaning of Being—presence-at-hand *(Vorhandenheit)*—which is not adjusted to finite existence as its own way of Being. In other words, the genealogy carried out by deconstruction aims at showing that Greek ontology, in its concern for the eternal features of nature, was mistaken in believing that the contemplation of those features allowed the philosopher to go beyond the finitude and reach the proximity of the divine. Quite the contrary; it remained trapped within everydayness. Here appears the *reversal:* the so-called overcoming of finitude was a falling away from it. The falling away from the authentic towards the inauthentic explains the predominance of the notion of presence-at-hand in traditional ontology.

As a result of this reversal, the notion of transcendence, which traditionally defined the position of the divine above the lower realm of immanence, was transformed by

Heidegger to designate the process through which the *Dasein* goes beyond beings towards Being: only the *Dasein* properly transcends, and it transcends beings towards Being.

The articulation of the project

Heidegger's project, inspired by a singular appropriation of Husserl and Aristotle, of fundamental ontology, designed as a reply to the question of the meaning of Being, included two tasks which provide the structure of *Being and Time* [2.2; 2.45].

The first part of the treatise was supposed to be devoted to 'the interpretation of *Dasein* in terms of temporality, and the explication of time as the transcendental horizon for the question of Being' (pp. 39; 63). The book, which came out in 1927, announced three divisions of Part One: (1) 'the preparatory fundamental analysis of *Dasein*'; (2) '*Dasein* and temporality' *(Zeitlichkeit);* (3) 'time and Being' (pp. 39; 64). The third division never appeared.

Part Two of the treatise was supposed to deal with the 'basic features of a phenomenological destruction of the history of ontology, with the problematic of Temporality *[Temporalität]* as our clue' (pp. 39; 63). This part, which also never appeared, was designed to have three divisions: the first one dealing with Kant's doctrine of schematism, the second with the ontological foundation of Descartes' *cogito sum,* the third with Aristotle's essay on time.

The published portion of Part One (which made Heidegger instantly famous) proceeded in two steps, corresponding to divisions one and two. If Part One starts with an analysis of *Dasein,* it is because the leading question of the meaning of Being rebounds as it were on the one who poses it. Indeed *Dasein* is the only being for whom Being is a question or an issue. If such analysis has to be fundamental, it is because, instead of restricting itself to the teachings of disciplines such as anthropology, psychology or biology, it must treat *Dasein* as a being for whom Being itself is the question, and not 'what is man?', 'what is mind?' or 'what is life?' If such analysis is preparatory, however, it is because it is carried out not for its own sake but in order to provide an answer to the question of the meaning of Being.

But even leaving aside the problem of what is prepared by it, the analysis of *Dasein* is not governed at all by the traditional question 'what?' Instead of addressing the question 'what is *Dasein*?' the analysis has to address the question 'who is *Dasein*?' Indeed the question 'what?' is not adjusted to *Dasein* for the reason that, in its *de facto* existence, *Dasein* is such that its very essence lies in its 'to be' *(Zusein),* or in its 'existence', a word which indicates an openness to a task, a possibility, and which is allotted by Heidegger solely to *Dasein* in order to avoid any confusion with the traditional use of *existentia* as equally valid for designating the Being of any entity whatsoever. In Heidegger's terminology the meaning of the word *existentia,* in its traditional use, is 'presence-at-hand', and is appropriate only to entities which are precisely *not* of *Dasein's* character. *Dasein* is thus the only entity in which existence has a priority over essence. Moreover if the question 'what?' has to be replaced by the question 'who?', it is because there is no *Dasein* in general, because an individual *Dasein* is not a special instance of some genus. *Dasein* as an entity for which Being is an issue in its very Being, is 'in each case

mine' (pp. 42; 67–8). As an entity which is its own possibility or existence and which is in each case mine, *Dasein,* in its very Being, can win or lose itself. 'Mineness' grounds either *authenticity* or *inauthenticity*. The German words, *Eigentlichkeit* and *Uneigentlichkeit,* have no moral connotation. *Eigentlichkeit* designates a condition in which someone is its own Being; *Uneigentlichkeit* refers to a condition in which someone is not properly its own Being.

As a result of the priority of existence over essence, the fundamental analysis of *Dasein* has to treat it from the existentiality of its existence. The access to the basic characters of that existentiality is given in the condition in which *Dasein* is 'proximally and for the most part'—everydayness. These basic characters of existentiality are called *existentialia*.

Because mineness grounds either authenticity or inauthenticity, all existentialia have an authentic and inauthentic modality. They all have a transcendental status, which means that they are a priori conditions of possibility for *Dasein's* existence. They are factors or items of a constitutive state of *Dasein* that Heidegger calls 'being-in-the-world'.

Being-in-the-world is the primordial phenomenon which has to be analysed in order to uncover the *existentialia*. Though the phenomenon is unitary, it is possible to look at it in three ways, by putting the emphasis on the 'world' as such, or on the 'being-in' as such, or on the one 'who' is in the world.

The world is neither the total amount of entities composing what is usually called the universe nor a framework for those entities. It is neither a global container nor an addition of contents. It is not nature. In order for nature to appear, a world is presupposed. The world must be understood a priori in terms of existentiality. Properly speaking, only *Dasein* is in the world, and there would be no world without *Dasein* intimately open to it. And since *Dasein* is not present-at-hand but existing, the world is not a global presence-at-hand that constantly encircles *Dasein*. Because *Dasein's* existence is its own 'can be' or possibility, the world which is at issue in the phrase 'being-in-the-world' must be described in terms of possibility, but a possibility which is already given. It is an *existentiale*.

If we take as clue our everyday way of Being, we must admit that our comportment is characterized as a concern with an environment. Within that concern we do not merely observe things present-at-hand. Instead we are constantly busy dealing with entities of a pragmatic nature endowed with a pragmatic meaning that we understand. Each of these entities is essentially 'something in-order-to', it is an instrument adjusted to this or that purpose. None of those entities is isolated. They are all interrelated, and in order for them to appear as 'in-order-to', they all presuppose as backdrop a context of involvement, with which we are familar. Such involvement is that 'wherein' we understand our ways and that 'for which' we let entities be encountered and used. But the involvement presupposed by our everyday concern itself refers to a deeper a priori which is the very relatedness of *Dasein* to its own potentiality for Being. This ultimate 'for the sake of which' is not a possibility within the world, it is the world itself as *Dasein's* own potentiality. World is another name for Being as that for the sake of which *Dasein* is transcending.

Similarly 'Being-in' has to be understood in terms of existentiality. And since existence as such is a disclosing process, the 'Being-in' is better captured as a lighting or

as an openness than as an insertion. Three existentialia constitute the 'Being-in': disposition, comprehension and discourse.

Disposition *(Befindlichkeit)* is the state in which *Dasein* finds itself. That *Dasein* essentially finds itself in some state is revealed by the moods or humours making manifest how one is. In terms of existentiality, moods reveal that *Dasein* has been delivered over to the Being is has to be. Heidegger calls 'thrownness' the facticity of being delivered over to Being. Hence disposition discloses *Dasein* in its thrownness.

Comprehension *(Verstehen)* is also to be conceived in terms of existentiality. In order to comprehend or understand the significance of the utensils it deals with in everydayness, *Dasein* has to project itself upon this or that possibility. In any act of understanding, there is some projection. But the *de facto* projections pervading *Dasein's* ordinary comportment have their ontological foundation in *Dasein's* projection upon its own 'can be'. As an *existentiale,* comprehension discloses *Dasein* itself in its own potentiality-for-Being.

'Discourse is existentially equiprimordial with disposition and comprehension' (161). The German word for discourse is *Rede,* which is Heidegger's translation of the Greek *logos*. In terms of existentiality, discourse is the disclosing articulation of the intelligibility of Being-in-the-world.

The reply to the question '"who" is in the world?' shows that *Dasein* in its everyday mode of Being is not properly a Self. Most of the time it loses itself in what it is busy with. In other words it understands itself in terms of what is ready-to-hand within the world. On the other hand it essentially belongs to *Dasein* to be with other *Daseins*. But here again the everyday mode of Being-with-one-another is such that *Dasein* is absorbed in the neutrality of the 'They' *(das Man),* instead of confronting its own *Dasein*. In both cases the inauthentic prevails over the authentic. Heidegger calls 'fallenness' the tendency *Dasein* has to forget its own Self or to move away from it. Fallenness is an *existentiale*. As a result of such a tendency, all the *existentialia* have two modalities: an authentic and an inauthentic one. For example, discourse in its inauthentic form is idle talk. Likewise comprehension in its inauthentic form is curiosity.

We can readily see that a temporal connotation is involved in the description of all these items. Already pre-given as a 'wherein', the world is a past. But as constantly anticipated as a 'for which', it is a future as well.

A temporal dimension is also involved in the three interconnected modes of disclosure which constitute 'Being-in'. Since disposition discloses the facticity of *Dasein's* thrownness, it reveals that it belongs to existence to have already been. It is also obvious in the case of comprehension as a project: if *Dasein* itself is a project, this means that structurally it throws itself forwards in the direction of a future. Discourse as an *existentiale* also shows a temporal dimension. By articulating 'Being-in-the-world' it expresses both the thrownness and the self-projection of *Dasein*.

Likewise, if the ontological answer to the question 'who?' has to be expressed in terms of a tension between authenticity and inauthenticity, the answer itself either emphasizes a future or, concerning the rule of the 'They' and of the everyday equipment, the predominance of what is currently the case.

Once Being-in-the-world is analysed in its constitutive items, there must be a synthetic return to the unitary character of the phenomenon. Heidegger characterizes the

ontological unity of *Dasein's* Being-in-the-world with a single word, *Sorge,* usually translated by the word 'care'. Care is the transcendental structure at the root of all the existential features mentioned so far. Care, as the ontological unifying structure of *Dasein,* is revealed in the fundamental disposition of anxiety, thanks to which *Dasein* realizes that it is already thrown in the world, that it has to be its own Being, and that it is thus thrown and projecting itself in a condition of proximity to inner-worldly beings whose Being is not its own Being. In the experience of anxiety the three intercon-nected dimensions of care are disclosed: facticity, possibility, fallenness among other beings.

This is a turning point in the existential analytic: it opens the way to the second division of Part One: *Dasein* and temporality.

The phenomenon of care is now manifest in its unity. However, the question remains: what about its totality? A phenomenon appears as a whole when its limits are made visible. Hence the problem is: what are the limits of care as the basic structure of existence? Clearly the limits of existence are birth and death. If we consider both limits as terms of a process which is not intrinsically determined by them, then we might say that, as soon as we exist, birth is over and that until we cease to exist, death is not there. But this view does not fit with *Dasein's* mode of Being: a project which is thrown. Precisely because *Dasein's* project is thrown, birth is not a mere moment which is over as soon as *Dasein* exists. *Dasein* cannot be who it is without having been thrown in the world with the limited possibilities which from the outset condition its Being. Likewise death is not the other external limit of existence. Existence as a project includes in itself, i.e., in its potentiality, its own end. This means that *Dasein's* death is not restricted to its Being-at-the-end. It is rather a manner of Being that *Dasein* takes over as soon as it is. It thoroughly permeates existence. It makes *Dasein's* project essentially finite and turns it into a Being-towards-the-end.

Because of such finitude, a negative feature, a negativity determines care in relation to both thrownness and project. What about the third dimension of care, i.e., the proximity with other beings? Is it also determined by negativity? The answer is ambiguous. It can be if and only if *Dasein* resolutely takes over its own mortality. But for the most part, because the proximity with other beings entails a predominance of pragmatic preoccupation over care, *Dasein* covers up its own finitude and thinks of death as a contingent event occurring to everybody and to nobody. They die, I don't.

This description allows us to understand how temporality is the ground of the ontological constitution of *Dasein*. According to ordinary views and a philosophical tradition going back to Aristotle, time is an unlimited sequence of moments, including the moments which once were but no longer are, those which are not yet and the one which is now. The sequence is considered to be irreversible and measurable. Heidegger claims that such a concept of time was shaped not on the basis of a phenomenal analysis of *Dasein* but on the basis of the experience of nature. Instead, the original concept of time has to be articulated in conformity with the ontological constitution of *Dasein*. A clue for the articulation is provided by the structure of care: Being-ahead-of-itself and already-being-in-a-world as well as falling and Being-alongside entities within-the-world. This structure points to the originary time. The 'Being-ahead-of-itself' indicates an anticipatory dimension. Since such anticipation is already there, it includes a retrieval of what and who the *Dasein* already is or has been. The anticipation is *Dasein's* future. It is the

existential future, whereas the retrieval is *Dasein's* existential past. Finally, the proximity with other beings points towards *Dasein's* present. Since that proximity is properly finite if and only if *Dasein* resolutely takes over its own Being-towards-the-end, the existential present can only be the instantaneous vision *(Augenblick)* by *Dasein* of the situation of its finite existence. Such vision includes a glimpse of the difference between the mode of Being called existence and modes of Being such as readiness-to-hand and presence-at-hand.

Heidegger claims that the foundation of care on the triadic structure of existential time is not at all a philosophical construct. It is ontically or pre-ontologically revealed to each one in the phenomenon of conscience *(Gewissen),* a phenomenon which is not itself moral in the first place, and demands a description in terms of existentiality. A specific call belongs to the phenomenon of conscience. The structure of such a call reveals a temporal foundation. The call is addressed to a fallen *Dasein* currently captivated by entities in-the-world. The call comes from *Dasein* itself in its facticity, a condition in which *Dasein* as thrown is in the mode of having been. And the message of the call is addressed to *Dasein* again in its ownmost potentiality-for-Being, i.e., in the mode of a future.

Heidegger insists that 'the primordial meaning of existentiality is the future' (324). However, neither the existential future (anticipation) nor the existential past (retrieval) nor the existential present (instant of vision) has the traditional character of a discrete entity. Because the existential future is a coming-to-oneself, it is a dimension and not at all a not-yet-present moment nor a sequence of not-yet-present moments. In Heidegger's language it is an *ecstasis*. Likewise the existential past and the existential present. The word *ecstasis,* which in Greek means 'standing outside', is used by Heidegger in order to emphasize a connotation of stretching towards, or openness to. With this Heidegger associates the notion of horizon. The horizon is that to which each *ecstasis* is open in a specific way. Existential temporality is ecstatico-horizontal. Now, because the *ecstases* are interconnected under the primacy of the future, because they belong together intrinsically, temporality is an ecstatic unity of future, past and present. Such unity has itself a horizon which is the condition of possibility of the world as existential and of *Dasein's* transcendence.

Because of its existentiality, temporality is essentially finite, instead of being an infinite sequence wherein existence would take place. It is the very process through which an intrinsically finite mode of Being opens itself to its own potentiality for Being and to other modes of Being. For the same reason, it is not enough to say that *Dasein's* existence is temporal. Rather, *Dasein temporalizes*. Genuine time is temporalization and even self-temporalization. In its ownmost Being, *Dasein* exists in such a way that it runs ahead towards its own end *(Vorlaufen),* retrieves its own thrownness *(Wiederholung),* and renders present its own situation *(Gegenwärtigung)*.

In the light of all this, it turns out that common time, as an infinite sequence, is derived from existential time. According to the common concept of it, time is a sequence of now-moments revealing itself in counting, a counting done in reference to a motion (the sun or the hands of a clock). In fact, Heidegger says, this reckoning of time is guided by and based upon a reckoning with time: time is already disclosed to us *before* we use a clock. The disclosure occurs in our daily comportment. Hence our daily reckoning with time is

what deserves analysis, if we want to define common time fully. As soon as we approach common time in these terms, we realize that the 'now' we check on the clock every day is never a naked and discrete entity given as an object at hand *(vorhanden)*. Now is always 'now that' I am doing this or that. When I say now, in daily life, I am always expressing myself as attending to something, as *presentifying* it. Likewise, when I say 'at that time', I display myself as *retaining* something bygone, either in the mode of recollecting it or in the mode of forgetting it. Similarly, when I say 'then', I show that I am *expecting* something to happen, on its own or by reason of my own deeds. Hence counting time leads back to a reckoning-with-time articulated according to presentification, retention and expectation. But this triad presupposes the existential triad mentioned above. While presupposing the original temporality, however, it also covers it up because of the falling character of everydayness, in which inner-worldly entities tend to prevail upon the existential world. As a result of our fallenness, time becomes an infinite sequence, whereas the original temporality is essentially finite. For the same reason, time becomes irreversible whereas authentic temporality is an ever-renewed encroachment of the past upon the future and vice versa. For the same reason, time gets bound to the *motion* of things whereas authentic temporality is the ownmost mobility of *Dasein*.

The entire analysis involves an explicit criticism of Aristotle, whose concept of time is indeed a free-floating sequence of nows, and an implicit criticism of Husserl's notion of time-consciousness which, as an articulation of retentions, living impressions and protentions, does not go beyond the level of everyday preoccupation.

The deconstructive reappropriation of the history of ontology

As far as Greek philosophy is concerned, there are in fundamental ontology several traces of a 'deconstructive' retrieval of Plato. Heidegger agrees with Plato that human beings are naturally philosophers although most of the time people do not care about philosophy. He also agrees with Plato's characterization of philosophy as a way of Being, a form of existence: the *bios theoretikos*. The distinction between the 'They' *(Das Man)* and the authentic Self owes much to Plato's demarcation between the multitude (the *polloi*) and the philosopher. The description of everydayness in terms of a productive preoccupation owes much to Plato's condescending characterization of active life in terms of *poiēsis*. The description of everyday language as empty talk is obviously indebted to Plato's contempt for *doxa* (opinion) and sophistry. Above all the Heideggerian hierarchy between three levels of seeing—the immediate intuition *(Anschauung)* of entities merely present-at-hand; the awareness that the mere presence of those entities is an abstraction deriving from a loss and fall in relation to their readiness-to-hand *(Zuhandenheit)* open to a practical circumspection; and finally the awareness, reached in the silence of conscience, that the everyday surrounding world *(Umwelt)* is in a position of falling away from one's authentic world, a world transparent *(durchsichtig)* to conscience only—that hierarchy is obviously an echo to the levels of seeing mentioned by Plato in the parable of the cave.

As far as medieval thought, with which Heidegger became acquainted during his early theological studies, is concerned, it is possible to recognize in his analytic of *Dasein* a discreet reappropriation of the scholastic concept of *analogia entis* (analogy of being).

Just as the medieval theologians determined what they called the degrees of Being in terms of an analogy between the kinds of beings and the *summum ens* (highest being), a divine being whose actuality is devoid of any potentiality and whose essence is identical with its existence, Heidegger determines analogically an hierarchy of the ways of Being, in reference to the *Dasein*. Thus he characterizes the being of the stone as 'worldless' and the being of the animal as 'poor in world' on the basis of a unique analogy with *Dasein,* whose essence, once it is thrown in its Being, is to exist, or to be in the world.

Likewise the very distinction between an everyday world in which the *Dasein* feels at home, and an authentic world in which it is homeless is not without a secularized reminiscence of Augustine's notion that the world is an exile, and that the Christians do not belong to it.

For modern philosophy, fundamental ontology includes a reappropriation and deconstruction of several major authors, such as Leibniz, Kant and Hegel.

In Leibniz the 'principle of ground' *(Satz vom Grund),* also for-mulated as the principle of Sufficient Reason which is supposed to provide an ultimate answer to the question 'why?', is based on the nature of truth. For Leibniz truth is to be found primarily in judgment, and judgment ultimately consists in an identity between subject and predicate, an identity such that it can be demonstrated that any *P* is analytically derived from *S*. But for Leibniz this analytical concept of truth is not simply a matter of logic. It has an ontological basis. Ultimately all the logical propositions *'S is P'* have their ontological foundation in the monads that harmoniously compose reality, each of them having in itself the reason or ground for what happens to it. At the time of fundamental ontology, Heidegger discussed Leibniz in the published essay *The Essence of Reasons* (*Vom Wesen des Grundes* [2.4]), but also in posthumously edited lecture courses such as *The Metaphysical Foundations of Logic* [2.34, 2.48]. Though rejecting the traditional privilege of judgment shared by Leibniz, he agrees with him that the problem of ground has to be dealt with in terms of the problem of truth. He also agrees that any ontic truth presupposes an ontological foundation of a monadic nature. But whereas Leibniz inserts such a foundation into an onto-theological framework, Heidegger attributes it to the transcending process through which the *Dasein,* as a Self, overcomes beings towards Being. That process of transcendence which is the ontico-ontological difference itself is the foundational coming-to-pass of truth as unconcealment.

Kant's philosophy was also the topic of a deconstructive appropriation. The major proof of this is offered by Heidegger's book *Kant and the Problem of Metaphysics* [2.3, 2.47]. The book is an attempt to demonstrate that the *Critique of Pure Reason,* at least in its first edition, somehow anticipates the project of fundamental ontology in its reply to the question 'How are synthetic judgments possible?' Heidegger insists that according to Kant the question makes sense only if it stems from a knowing being which is essentially finite. Kant finds the sign of that finitude in the fundamental receptivity of sensibility. Sensible receptivity means that we, human beings, can know only beings that we do not create. However the ontic knowledge of those beings, which for Kant takes place in the experience of natural entities, requires an a priori synthesis which has, Heidegger claims, the nature of an ontological knowledge, i.e., of an a priori comprehension of the Being of those beings. In Kant, that a priori synthesis is the union of pure intuition (the a priori forms of space and time) with the pure categories of the understanding, a union carried

out by transcendental imagination through the protection of transcendental schemata characterized as transcendental determinations of time. By recognizing the decisive role of time—more precisely of a temporalizing process performed in the depths of the knowing subject, at the core of a synthetic or ontological knowledge enabling ontic access to beings as objects—Kant would have anticipated Heidegger's own attempt to show that our openness to beings presupposes a comprehension of their Being, i.e., a transcendence happening in the horizon of temporality. However, in its deconstructive aspect, this reappropriation of Kant also emphasizes the limitations of his endeavour: (1) a framework which is the legacy of Christian metaphysics with its distinction between *metaphysica generalis* and *metaphysica specialis* (psychology, cosmology, theology); (2) a one-sided concept of Being as presence-at-hand, therefore a one-sided concept of time, as a sequence of present moments, although Kant's notion of self-affection partially overcomes this one-sidedness; and (3) also the fact that Kant himself, as evinced by the second edition of the *Critique of Pure Reason,* seems to have withdrawn from his own discovery of finite transcendence in the operation of transcendental imagination.

Heidegger in *Being and Time* is entirely critical of Hegel, and at several places in the book he carefully discards any semblance of a proximity between the Hegelian conceptions and his own position. He claims, for example, that the Hegelian definition of time merely maintains traditional views leading back to Aristotle's *Physics,* and is one-sidedly focused on presence-at-hand. Moreover, he insists on the abstraction and formalism of Hegel, compared to the concreteness of his own fundamental ontology. And against the Hegelian thesis according to which Spirit falls into time, he objects that the very meaning of a 'fall' is left in the dark by Hegel. Instead of claiming that Spirit falls *into* time, the meaningful thesis about the fall should be expressed in this way: 'factical existence "falls" as falling *from* primordial, authentic temporality' ([2.2] 486; [2.45], 435–6). In spite of this apparent discarding of Hegel, readers of *Being and Time* are allowed to suspect, in relation to the history of ideas, that Heidegger's analysis of anxiety as a crucial experience which is not to be confused with ordinary fear, and the characterization of Being in terms of 'no being' or Nothingness, are not without some relation to Hegelian topics. One is inclined to suspect that there is indeed some reappropriation of Hegel in fundamental ontology.

Such a reappropriation comes to the fore in Heidegger's essay of 1929, *What is Metaphysics?* [2.5, 2.50], the text of his inaugural lecture at the University of Freiburg on the occasion of his accession to the Chair of Philosophy left vacant by the retirement of Husserl. At the outset of this essay, Heidegger states that he is in accord with Hegel's comment that 'from the point of view of sound common sense, philosophy is the "inverted world"' (p. 95). And further on, he reveals a second point of agreement. After a description of anxiety as a meta-physical experience in which nothingness manifests itself, he quotes Hegel's *Science of Logic:* 'Pure Being and pure Nothing are therefore the same' (*Wissenschaft der logik,* vol. 1, 111, p. 74). This proposition, Heidegger says, is correct, 'Being and nothing do belong together' (*Basic Writings,* p. 110). To be sure, these two points of agreement are rather formal and Heidegger adds that his own emphasis on the finitude of Being revealing itself in the transcendence of *Dasein* marks a fundamental divergence in spite of a formal proximity. But a lecture course of 1930–1 devoted to an interpretation of Hegel's *Phenomenology of Spirit* shows that there was

much more than a formal convergence, and that Heidegger's fundamental ontology really crossed the Hegelian path. Focusing on the transition from consciousness to self-consciousness, the lecture course claims that Hegel's notion of 'life' in the *Phenomenology of Spirit* unfolds a concept of Being which is no longer caught in the traditional notion of presence-at-hand. Moreover, Heidegger in the lecture course expresses admiration for the Hegelian description of the movement by which absolute knowledge absolves itself from natural knowledge. That description, he suggests, has to be considered as a transposition in an absolute framework of the very movement of finite transcendence.

Finally, fundamental ontology involves a reappropriation of Nietzsche on one point at least: historicality. In *Being and Time* ([2.45], section 76), Heidegger attempts to demonstrate that historiology *(Historie)* has its existential source in *Dasein's* historicality. *Dasein's* Being is essentially historical 'in so far as by reason of its ecstatico-horizontal temporality it is open in its character of "having been"' ([2.45], 445). In the context of the demonstration, Heidegger insists that 'Nietzsche recognized what was essential as to the "use and abuse of historiology for life" in the second of his studies "out of season" (1874), and said it unequivocally and penetratingly' ([2.45, 448]). For both Heidegger and Nietzsche the so-called objectivity of historical sciences, instead of being primordial, is a falling away from an active movement of uncovering directed towards the future. For both, that active movement is essentially interpretative or hermeneutical. For both, it is also circular because it creates an overlapping of the future and the past.

In other words, Heidegger suggests that by saying that only master builders of the future who know the present will understand the past, Nietzsche anticipates the Heideggerian topic of the 'hermeneutic circle'.

THE HISTORY OF BEING

Paroxysm and interruption of fundamental ontology

The basic principle of the analytic of *Dasein,* worked out in *Being and Time,* was: *Das Dasein existiert umwillen seiner* (*'Dasein* exists for the sake of itself). In the light of this principle, the project of fundamental ontology intended to demonstrate under the heading 'Time and Being' how the various meanings of Being—such as life, actuality, reality, permanence and so on—had to be understood as deriving from the self-projecting existence of *Dasein*. But the principle itself was restricted to the way of Being of individuals.

That restriction vanished in 1933 when Heidegger decided to support Hitler and became the first National Socialist rector of the University of Freiburg. The focus of his Rectoral Address is no longer the individual *Dasein* but the *Dasein* of the German people. As a result of that shift many concepts of *Dasein's* analytic undergo a significant metamorphosis.

The early version of fundamental ontology had reappropriated the Aristotelian *praxis* in the direction of *Dasein's* solitary insight *(theoria)* into the finiteness of its own Being,

therefore in the direction of *Dasein's bios theoretikos*. Heidegger in 1933 once again claims that the intention of the Greeks was to understand *theoria,* in its relation to Being, as the highest form of *praxis*. But he adds that *theoria,* thus understood as the science of the Being of beings, is 'the very medium that determines, in its ownmost Being, the *Dasein* of a people and of the State' (*The Self-assertion of the German University (Die Selbstbehauptung der deutschen Universität)* [2.7], 12). Accordingly, no longer the individual *Dasein* but the very existence of a people organized in a state seems to become the authentic location for the unconcealment of beings in their totality and in their Being. Now the organization of a people is obviously not a matter of pure *theoria,* but a matter of *technē,* of knowhow and of *poiēsis*. Consequently as a result of the shift from individual *Dasein* to the *Dasein* of a people-in-a-state, *technē* is no longer confined within the inauthentic realm of everydayness. To be sure, there is an ordinary *technē* which is still restricted to those limits, but, in addition to it, there is now place for an authentic *technē,* a knowhow which, instead of being fascinated by what is merely present-at-hand, is ontologically creative. In this context, Heidegger recalls an old Greek legend according to which Prometheus would have been the first philosopher, and he quotes the words of Prometheus in Aeschylus' tragedy: *'technē* however is much weaker than necessity.' Necessity is here interpreted by him as the 'overpower' of destiny. In such 'overpower' a concealment of being is involved which challenges knowledge and demands a metaphysical reply, in terms of a creative *technē*.

Along with the transposition of the notion of *Dasein* to a people, and the introduction of a creative *technē,* the Rectoral Address also introduces the idea that Being itself, and not only *Dasein,* is intrinsically polemical and historical; and that *Dasein*—either as an individual or as a people—is the 'there' of Being.

But in spite of all these modifications, the Rectoral Address maintains the project of a fundamental ontology, as a task including a metaphysics of *Dasein* articulated according to the opposition between a fallen everydayness, fascinated by presence-at-hand, and a resolute authenticity dedicated to unconcealing Being by transcending beings.

The two lecture courses offered by Heidegger after the rectorate period—a lecture course on Hölderlin [2.37] given in the winter term 1934–5, and a lecture course on the *Introduction to Metaphysics* [2.8, 2.53] given in the summer term 1935—introduce developments of topics treated in the Rectoral Address, but they also maintain the framework of fundamental ontology.

The lecture course on Hölderlin starts by discarding, in order to listen to the poet, all the forms of fallen everydayness already described in *Being and Time* as obstructing the question: Who is *Dasein?* The *Dasein* at stake here, however, is no longer the individual but 'the authentic gathering of individuals in a community' ([2.45], 8). Hölderlin's poetry, in the poems *'Germani*[a]*'* and *'Am Rhein',* is supposed to raise the question: 'Who are we, the German people?' The question demands a withdrawal from everydayness and a resolute attitude of racial questioning opposed to the 'They'. In continuity with *Being and Time,* Heidegger characterizes everydayness in terms of *technē,* i.e., circumspection dedicated to the management of surroundings, to production, usefulness and the general progress of culture. That inauthentic comportment encompasses the everyday life of the Nazi regime: cultural activism, subordination of thought and the fine arts to immediate political needs, biologism, and the rule of bureaucrats. But on the level of authenticity

there is a place for a quite different *technē,* adjusted to the historical *Dasein* of the German people. Only a few individuals are aware of the innermost historiality of that people. These few are the creators: the poet, the thinker and the founder of the state. The co-operation of these three creative types is described by Heidegger in his interpretation of what he calls the *Grundstimmung,* the basic mood of the two poems, i.e., Hölderlin's holy mourning in the face of the flight of the gods. The poet institutes *(stiftet)* the truth of the *Dasein* of the people. The thinker elucidates and articulates the Being of beings thus disclosed by the poet. But the co-operation of the two requires the people to be led to itself as a people. This can only occur through the creation by the state-creator of a state adjusted to the essence of that people. That triad embodies the Promethean *technē* mentioned in the Rectoral Address. The three of them rise to the level of demigods preparing the conditions for a return of the divine.

The same Promethean trend is to be found in Heidegger's dialogue with pre-Socratic thought in the *Introduction to Metaphysics*. As a result of the elevation of a creative *technē* to the highest ontological level, Heidegger now detects between Parmenides, Heraclitus and Sophocles convergences pointing to an ontological assignment to setting-into-work what the creative *technē* sees or knows. The assignment is required by the polemical essence of what the early Greek thinkers called *physis,* an appellation which, like the word *alētheia,* is taken to be another name for Being. Being is polemical because, on the one hand, it is an unconcealment which retains itself in itself while disclosing itself in beings; and because, on the other hand, it is again and again threatened, in its very disclosure, by sheer semblance, deception, illusion. Therefore it is an 'overpowering' calling for a creative self-assertion defined as a decision *(Entscheidung)* to provide a 'separation in the togetherness of Being, unconcealment; appearance, and Non-Being' ([2.8], 84; [2.53], 92). And since there is a violence in the 'overpowering' of Being such decision has to be disrupting and violent. This violent response to the 'overpowering' of Being is what characterizes *technē* in its essential meaning. *Technē* provides the basic trait of the Greek *deinon* (uncanny) evoked in a famous chorus of Sophocles' *Antigone*. So understood, *technē* is both a knowledge and a creative power. As a knowledge, it is a sight looking beyond what is present-at-hand; as a creative power, it is the capacity to set-into-work within being the historical unconcealment of Being. In this context, Heidegger claims that unconcealment takes place only when it is achieved by work: 'the work of word in poetry, the work of stone in temple and statue, the work of the word in thought, the work of the *polis* as the historical place in which all this is grounded and preserved' (pp. 146; 160). In this context, Heidegger celebrates what he calls 'the inner truth and greatness' of the National-Socialist movement versus the ideology (racism) and everyday practice of the Nazi Party.

In these two lecture courses the introduction of a distinction between a petty *technē* trapped in everydayness or presence-at-hand and a lofty *technē* able to set-in-work Being itself in its unconcealment not only leaves untouched but even reinforces the articulation of fundamental ontology—i.e., the opposition between ordinary time and authentic temporality. The fact that the *Dasein* at stake is now understood as the *Dasein* of a people, either Greek or German, simply widens the basic principle of *Being and Time* according to which the *Dasein* exists for its own sake and by willing itself. It could even be said that the Promethean connotation of these texts brings fundamental ontology to a

sort of metaphysical climax. Heidegger suggests, indeed, that it is because of its foundational role towards his people that his own work deserved the heading of fundamental ontology (pp. 113; 146). And he quotes with admiration Hegel's words in the *Logic* of 1812: 'A people without a metaphysics is like a temple without a Holy of Holies.' Metaphysics is thus the privilege of Germany, whereas western democracies, particularly the United States, on the one hand, and the USSR on the other hand, are said to be absorbed in the frenetic development of the petty *technē*.

However, this paroxysm was soon going to bring fundamental ontology to an end, and to open the way to a 'turn' *(Kehre)* in Heidegger's thought. A comparison between the successive versions of his essay *The Origin of the Work of Art* bears witness to such a turn, or at least to a shift in Heidegger's treatment of the question of Being. Indeed the two early versions of the essay preserve the Promethean tendency which characterized the *Introduction to Metaphysics;* whereas the third and final version is no longer Promethean at all. All the topics tackled by the *Introduction to Metaphysics*—the people and its gods, the greatness of a creative *technē,* decision, the ontological *polemos* (conflict)—are still mentioned in the final version, but they lose their previous hardness thanks to an overall tonality which is more meditative and open to enigmas than voluntarist and proclamatory.

In the three versions, Heidegger insists that there is a circle in the investigation into the origin of the work of art. Indeed, if it is true that the artist is the origin of the work, it is also true that the work is the origin of the artist since neither is without the other. However, both are what they are by virtue of art itself. But if it is true that the essence of art should be inferred from the work, it is no less true that we could not recognize a work of art as such without referring to the essence of art. Hence the interrogation into the origin of the work of art moves in a circle. In the two early versions of the essay the topic of the circle operates as a device for signifying the circular character of *Dasein* as a being which projects its own Self by retrieving its thrownness, in such a way that project is a retrieval, and retrieval is a project. But in the final version that emphasis on *Dasein's* existence for its own sake is replaced by an emphasis on Being itself inasmuch as Being is neither limited to beings nor without them, and neither encapsulated in *Dasein* nor without it.

Moreover, whereas the early versions insisted on the contrast between everydayness and creative self-assertion, the final version is almost without sign of a contempt for everydayness and its pettiness. It is significant in this regard that the first section of the final version of the essay is entirely devoted to the question: what is a thing in its thingly character? In the framework of fundamental ontology, as well as in the early versions of the essay, that question was clearly not an important issue for the task of thinking, and there was nothing enigmatic in the question. Indeed, there was an easy answer to it, in terms of everydayness: the Being of things is either presence-at-hand (natural things) or readiness-to-hand (equipment). By contrast, the final version of the essay states the following: 'The unpretentious thing evades thought most stubbornly. Can it be that this self-refusal of the mere thing, this self-contained independence, belongs precisely to the nature of the thing? Must not this strange feature of the nature of the thing become what a thought that has to think the thing confides in? If so, then we should not force our way to its thingly character' ([2.55], 32). In other words, everydayness, instead of being the

familiar realm that resoluteness has to overcome in order to face the homelessness of existence, now becomes strange and deserves meditation in its familiar outlook. Dwelling among things no longer obstructs thought, quite the contrary. It is also significant that the reliability of equipment previously defined by its readiness-to-hand, hence in relation to *Dasein* only, now turns out to bear testimony to an enigmatic interplay of unconcealment and concealment in Being itself. This is what Heidegger tries to suggest in his meditation on one of Van Gogh's paintings of a pair of shoes.

The second section of the final version of the essay also marks a change regarding the notion of truth. Heidegger's point in the three versions is that in the work of art truth sets itself to work. Truth, here once again understood as *alētheia* or unconcealment, is of an essentially ambiguous and polemical nature, for it is a mixture of disclosedness and withdrawal. This polemical nature of truth is revealed by the conflictual nature of the work of art. While setting up a world, the artwork sets forth the earth, but whereas the world is an opening of paths, the earth is a self-seclusion. Hence there is in the work of art a strife between world and earth. Such strife characterizes truth itself as unconcealment. But whereas the early versions of the essay maintain the priority of *Dasein* regarding truth by making the *Dasein* of a people the locus of truth, the final version characterizes unconcealment as a clearing *(Lichtung)* to which human beings belong and are exposed. Consequently the meaning of resoluteness also changes: it is no longer the project to be a Self but an exposure to the secret withdrawal at the core of the clearing.

Finally, the last section of the final version is an attempt to define creation without reference to Promethean self-assertion. What is now considered to be fundamental in the work, inasmuch as it is created, is no longer its ability to anticipate in a leap what a people decides to be. What is decisive in it, as created, is this: 'that such work is at all rather than is not' ([2.55], 65). In other words, the enigma of a coming-to-presence now overcomes the previous privilege of future self-projection. The creator is no longer a violent struggler but someone receptive to the clearing.

The turn and the overcoming of metaphysics

Why did Heidegger give up his project of fundamental ontology? The question raises an extremely complex issue and there are at least three ways of approaching it. From a strictly systematic point of view, it is possible to notice a paradox at the core of the project. Indeed if fundamental ontology—the science of the meaning of Being—is identified with the ontological analysis or metaphysics of *Dasein* (as seemed to be the case up to the *Introduction to Metaphysics*), then, as Heidegger himself said at the time, 'ontology has an ontical foundation' (*Basic Problems,* p. 26). But how is it possible to avoid then the reduction of Being to characteristics of a being, more precisely to *Dasein's* way of Being? If, on the other hand, the metaphysics of *Dasein* is only the provisional preparation of a systematic ontology, then a distinction has to be made between the temporality of *Dasein* and the temporality of Being itself; and, consequently, the provisional character of the analytic of *Dasein* contradicts its allegedly fundamental function. In both cases, the attempt made in *Being and Time* (and later extended to surpass the limits of individual *Dasein*) turns out paradoxically to be itself a manner of

oblivion of Being to the benefit of a being.

A second way of approaching the issue would be a close chronological investigation of the variations, appearing during the 1930s and early 1940s, in Heidegger's use of the notions coined in *Being and Time*. Such investigation remains to be done on a twofold basis: the lecture courses already published or in the process of being edited in the *Gesamtausgabe,* particularly those on Nietzsche (1936–41), and the long text written by Heidegger for his own use under the heading *Contributions to Philosophy* (*Beiträge zur Philosophie* 1936–8) [2.38].

A third approach is offered by Heidegger's own explanations of what he called the 'turn' which, at some point, occurred in his thought. The first among these self-interpretations is Heidegger's *Letter on Humanism,* written in 1946 in reply to questions raised by Jean Beaufret.

It is not certain, however, that the results of the three approaches could ever coincide, mainly because of Heidegger's tendency to justify retrospectively each step of his philosophical development. Despite these difficulties there is no doubt that several topics which had no place whatsoever in fundamental ontology came to the fore during the second half of the 1930s. The lecture courses on Nietzsche are extremely significant in this regard.

It has been noticed by several readers of the *Nietzschebuch* (Mehta; Arendt) that in the first lecture courses (1936–9) Heidegger interprets Nietzsche in terms of the analytic of *Dasein* and shows a basic agreement with Nietzsche, whereas the courses of 1939–41 are polemical. This is why Hannah Arendt claimed that initially the 'turn' was a biographical event, by which she meant that, underneath a polemical debate with Nietzsche, it was an explanation of Heidegger to himself, and an attempt to discard his own voluntarist inclinations during his activist period.

At any rate, what comes to the fore in the polemic against Nietzsche is a new way of considering the history of metaphysics. In fundamental ontology, the point was to deconstruct the biases and confusions inherent in past philosophies in order to liberate metaphysics and complete it as the science of the meaning of Being. Now, the point is to consider its development as a fatal destiny and to prepare its overcoming. That destiny is characterized as an increasing oblivion of Being culminating in Nietzsche's philosophy of the will-to-power and of the eternal return of the same, interpreted by Heidegger as nihilism.

At the dawn of western thought, the key words of the pre-Socratic thinkers, above all the word *alētheia,* all signalled the process through which beings are brought to the 'open' in tension between a reserve and an appearing. This means that Being was experienced as fully differentiated in the manner of an offering which withholds itself in what it gives. This differentiation indicates a finiteness of Being to which corresponds thinking as a receptivity to the secret of Being. The first erasing of this differentiated correspondence and mutual belonging starts with Plato. Plato's dialogues demonstrate a tendency to transform a mere consequence of the ambiguous process of *alētheia* into the essence of truth. In Plato beings reveal their beingness through ideas. The word initially meant the outlook offered by things as they emerge out of *physis*. Therefore it meant a consequence of the process of unconcealment. But Plato's ideas come to the forefront and get split off from the unconcealing process. Moreover, they acquire a normative status in

relation to *physis*. Unconcealment then becomes a result of the clarity of the ideas which themselves refract the clarity of a supreme idea, the Good. This is the birth of metaphysics as onto-theology. The task of metaphysics from now on is to develop a theory of the essence of beings, a logic of their beingness, i.e., an ontology, and simultaneously to develop a theology by relating their beingness to a primordial being. *Alētheia* is thus obliterated by an ontical hierarchy, and truth becomes a matter of correctly seeing the ideas. Accordingly, the mutual belonging of Being in its ambiguity and of thinking in its receptivity to the same is levelled down to a contemplative conformity of the mind to essences.

A second stage in the metaphysical oblivion of Being took place in the Middle Ages. In medieval thought the Platonic concept of truth as conformity of the intellect to the beingness of beings, coupled with the founding role of a supreme being, was retrieved within the Christian speculations about creation and the dependence of the created on the creator. Truth in the scholastic sense of *adaequatio intellects ad rem* (adequacy of the mind to the thing) is now grounded upon the deeper *adaequatio rei Dei intellectus* (adequacy of the thing to the mind of God).

A third stage occurred at the beginning of the modern age with the invention of subjectivity. When Galileo Galilei introduces, in still approximate terms, the first formulation of what Newton, a few decades later, was to call the principle of inertia, he uses the words 'mente concipio' (conceive in my mind). What is significant here, for Heidegger, is not the replacement of the sensible outlook of natural phenomena (the cornerstone of Aristotelian physics) by a purely intellectual approach of nature, but the fact that inertia, in order to appear at all, requires the human mind to give itself a preconception of what motion is and thus projects in advance the condition for phenomenality. In the conformity of adequation between intellect and thing, the stress is now put on the intellect in such a way that the thing manifests its truth inasmuch as it fits with a project emanating from the *mens*. Deeper than the modern use of mathematics in physics, there is what Descartes called *mathēsis*—a project by which the *cogito* ascertains itself on its own and acquires a position of mastery. In Descartes' philosophy, with the restriction of the dependence of the finite human mind on the divine infinity, the *cogito* posits itself as the unique basis upon which beings reveal their beingness. The word for basis in Greek was *hupokeimenon,* in Latin *subjectum*. The *cogito* becomes the only *subjectum*. The rule of subjectivity begins. The modern object-subject correlation means that beings are what they are to the extent that they submit themselves to the rule of the human *cogito*.

Such is the birth of the reckoning and evaluating reason which determines modernity. All its features appear at the outset. The *mathēsis* is *universalis,* which means that it is planning for the totality of beings. It is both a subjectivation of all beings referring them to the *cogito* and an objectivation making them all equally calculable and controllable. Earlier than the current reign of technology, right at the beginning of the modern era, nature as a whole was conceived as one huge mechanism in relation to a technological way of looking.

Between Descartes and Nietzsche, Heidegger does not notice a fundamental discontinuity. Nietzsche's notion of the will-to-power was in several ways anticipated by Descartes and subsequent thinkers: Leibniz's notion of the monad as a conjunction of

perception and appetite in addition to his principle of Sufficient Reason; Kant's concept of reason as a condition of possibility; Fichte's reinterpretation of Kant in terms of practical reason; Schelling's conviction that there is no other Being than the Will; Hegel's concept of the Absolute, willing its self-identity throughout differentiation. So while claiming to be liberated from metaphysics, Nietzsche was merely bringing it to its accomplishment and carrying modern subjectivity to an onto-theological climax. Heidegger indeed interprets the will-to-power in ontological terms as the beingness of all beings, and the eternal return of the same in theological terms as the ultimate ground of beingness and being. Defined as the beingness of all beings, the will-to-power pushes to an extreme limit the project of objectivation and subjectivation inherent in *mathēsis*. Objectivation is brought to an extreme because the will not only treats every being as an object *(Gegenstand)* but also compels any object to become a storage *(Bestand)* available to all kinds of assignment and manipulation. Subjectivation is brought to an extreme as well, for all things are reduced to the values that the will bestows on them in order to intensify its power. On the other hand, the eternal return of the same, defined as the ultimate form of being, signifies an endless, circular, repetitive machination which is the metaphysical essence of modern technology. The abyssal thought of the eternal return means that the will aiming to intensify itself is itself willed and challenged to will itself infinitely. On both counts, Being has definitely lost the enigmatic ambiguity which was experienced by the early Greeks. Being is like nothing. Nihilism rules.

It is significant of the 'turn' at work in this meditation on modernity that Heidegger's description of what he calls 'European nihilism' in a 1940 lecture course on Nietzsche includes the following remarks about *Being and Time:* 'The path followed in it is interrupted at a decisive place. The interruption is explainable by the fact that, all the same, the attempt made on that path was running the risk, against its own intention, to reinforce furthermore subjectivity' (*Gesamtausgabe* vol. 48, p. 261).

The main result of the above description of the history of metaphysics is the claim that modern technology is the last accomplishment of a long process of oblivion of Being inherent in metaphysics since Plato. Heidegger uses the word *Gestell* to characterize the nature of modern technology. *Gestell* is a global 'enframing' wherein beings are entirely available to all sorts of arbitrary evaluations and manipulations, and in which Being counts for nothing. To that global enframing Heidegger opposes what he calls *Ereignis,* often translated as 'event of appropriation', a term already used in his *Beiträge* of 1936–8. Within the global enframing, thinking is replaced by calculation. It is only by meditating *Ereignis* that thinking can remain alive. Thinking the *Ereignis* is a counter-current to nihilism.

That opposition pervades the writings of Heidegger after the Second World War. In all of them the voluntarist tonality of *Being and Time* and of the *Introduction to Metaphysics* has vanished. Significantly the word *Dasein* is now spelled *Da-sein:* there-being. The mortals are the 'there' of Being. They are exposed to the secret granting of Being. Significantly, also, a topic such as the 'call', which was restricted in *Being and Time* to *Dasein's* listening to its ownmost potentiality, now emanates from Being itself. Whereas in fundamental ontology the human *Dasein* was the lieutenant of nothingness, it is now the shepherd of Being. Whereas fundamental ontology somehow conflated thinking and willing, thinking is now a matter of not-willing, of letting-be *(Gelassenheit),* and even of

thanking. Whereas fundamental ontology conceived of dwelling in terms of a preoccupation of inauthentic everydayness, dwelling now deserves profound meditation. Likewise for the 'thing', a topic to which Heidegger devoted several essays in the late period. Likewise for speech, formerly taken as a capacity of *Dasein,* and now characterized in terms of a call emanating from Being, of a gathering of Being and of a corresponding to it. That shift from *Dasein* to Being explains why Heidegger criticized humanism as an aspect of metaphysics.

The shift of emphasis also generates a change in Heidegger's thought about time. While maintaining the notion of *ecstasis,* Heidegger no longer understands ecstatical temporalization in terms of an existential self-project, but in terms of a belonging of *Dasein* to the ambiguous unconcealing process of Being allegedly covered up by the entire tradition of metaphysics. This becomes apparent in a lecture given by Heidegger more than thirty years after *Being and Time,* under the significant title *Time and Being* (1962). This is the title which had been announced in 1927 as the heading of the third division of the book, a division which never appeared. The lecture of 1962, however, is not to be considered as the completion of the project of 1927.

It is a significant feature of the 'turn' that the topic is presented in neutral terms, in which *Dasein* no longer plays a central role. Heidegger indeed announces that his meditation is oriented by the sentence 'Es gibt Sein, Es gibt Zeit', which literally means: 'It gives Being, It gives time.' This neutral phrasing clearly suggests that the issue is no longer Dasein's temporalization. In both sentences, the phrase 'Es gibt' invites the audience to hear an offering which is not itself reducible to what it is offering. Hence the sentence 'It gives time' points to anoffering which keeps withdrawing itself within what is offered. Already in the word 'present' there is more than the now; what is also meant by the word is a gift bestowed upon man. Open to the presence of the present, mortals welcome the granting. The emphasis is no longer on the project of the self but on receptivity to the granting.

In this context, the prior concept of *ecstasis* is modified. Each *ecstasis,* as well as the unity of the three *ecstases,* is now understood as a granting extended to human beings. Instead of saying that the past is what we retrieve in the light of our finite project, Heidegger now says that it happens to us, extending itself to us and soliciting us. The past is an *ecstasis* in the sense of the coming towards ourselves of an absence which concerns us while it is granted to us. Absence is itself a mode of presence if we think of presence in the sense of a granting. But in each there is an interplay of granting and withholding. The same holds true for the unity of the *ecstases*. Heidegger now calls each *ecstasis* a dimension, and he calls the unity of the *ecstaseis* the fourth dimension of time.

About such unity, Heidegger no longer evokes a privilege of the future. The emphasis is now on the coming-to-presence. Moreover, instead of evoking *Dasein's* temporalization, he suggests that time temporalizes from itself. The unifying fourth dimension of time is characterized as a disclosed interplay of the three *ecstases,* a clearing extension, an opening. However it is also characterized by a denial, a withholding. Time nears and holds back. It is radically ambiguous. The granting, effective in it, is also a denial.

This new apprehension of time is at the core of Heidegger's notion of *Ereignis* which he opposes to *Gestell*—the technological enframing for which there is no secret

whatsoever. In German *Ereignis* means 'event'. In Heidegger's terminology it designates the co-belonging of Being and man. He insists on both etymological roots of the word. They are *er-eignen,* 'appropriating', and *'er-äugen',* bringing to visibility. There is no doubt that the use of the word in this twofold meaning signifies a contrast with the use of words such as *eigen* ('own'), and *Eigentlichkeit* ('authentic selfhood') in *Being and Time*. The *Ereignis* is not to be conceived of in terms of the Self at issue in the work of 1927. What is at stake in it is no longer a project but a *Schicken,* a sending or a destining. The event of co-belonging between Being and man is the manner in which Being destines itself to us, by opening the playspace *(Spielraum)* of time wherein beings appear. But destiny withholds itself in order for its granting to occur. The history of Being is that destiny. In it each epoch is an *epokhē,* a withholding of Being within its donation. In each case the *Ereignis* witholds *(enteignet)* itself. Consequently the task of thinking is no longer to be defined by the phrase 'Being and time' but by the phrase *Lichtung und Anwesenheit,* 'clearing and coming-to-presence', both understood in terms of a granting and a denial.

The trouble with this history of Being is that, in spite of the above signals of a significant shift in Heidegger's thought, it reproduces in a new way the previous contrast between the 'They' and the Self. Indeed only a few German poets (Hölderlin, Trakl, George) and Heidegger himself—but not the plurality of human beings interacting in a common world of appearances and events—seem able to properly respond to the ambiguity of the destiny of Being.

Moreover, the previous privilege of *Dasein's bios theoretikos* reapppears in a new manner: thinking is the only activity able to prepare a new beginning in the history of Being.

SELECT BIBLIOGRAPHY

Major books published by Heidegger himself

2.1 *Frühe Schriften* (1912–16), ed. F.-W.von Hermann, Frankfurt: Klostermann, 1978.
2.2 *Sein und Zeit* (1927), Tübingen: Niemeyer, 1953.
2.3 *Kant und das Problem der Metaphysik* (1927), Frankfurt: Klostermann, 1951.
2.4 *Vom Wesen des Grundes,* Frankfurt: Klostermann, 1928.
2.5 *Was ist Metaphysik?* (1929), Frankfurt: Klostermann, 1955.
2.6 *Vom Wesen der Wahrheit* (1930, 1943), Frankfurt: Klostermann, 1961.
2.7 *Die Selbstbehauptung der deutschen Universität,* Breslau: Korn, 1933. Later reprinted in *Das Rektorat 1933/34: Tatsachen und Gedanken,* Frankfurt: Klostermann, 1983.
2.8 *Einführung in die Metaphysik* (1935), Tübingen: Niemeyer, 1953.
2.9 *Erläuterungen zu Hölderlins Dichtung* (1936, 1944), Frankfurt: Klostermann,
2.10 *Holzwege* (1936–46). Frankfurt: Klostermann, 1950.
2.11 *Nietzsche* (1936–46), 2 vols, Pfullingen: Neske, 1961.
2.12 *Vorträge und Aufsätze* (1943–54). Pfullingen: Neske, 1961. Contains eleven essays, including 'Die Frage nach der Technik' and 'Bauen, Wohnen, Denken'.
2.13 *Platons Lehre von der Wahrheit* (1942). *Mit einem Brief über den*

'Humanismus' (1946), Bern: Francke, 1947.
2.14 *Was heisst Denken?* (1951–52), Tübingen: Niemeyer, 1954.
2.15 *Was ist das—die Philosophie?* (1955), Pfullingen: Neske, 1956.
2.16 *Zur Seinsfrage* (1955), Frankfurt: Klostermann, 1956.
2.17 *Der Satz vom Grund* (1955–6), Pfullingen: Neske, 1957.
2.18 *Identität und Differenz,* Pfullingen: Neske, 1957.
2.19 *Unterwegs zur Sprache* (1950–9), Pfullingen: Neske, 1957.
2.20 *Gelassenheit,* Pfullingen: Neske, 1959.
2.21 *Die Frage nach dem Ding* (1936, 1962), Pfullingen: Neske, 1962.
2.22 *Die Technik and die Kehre,* Pfullingen: Neske, 1962.
2.23 *Wegmarken* (1967), Frankfurt: Klostermann, 1978.
2.24 *Zur Sache des Denkens,* Tübingen: Niemeyer, 1969.
2.25 *Schellings Abhandlung über das Wesen der menschlichen Freiheit* (1936), ed. H.Feieck, Tübingen: Niemeyer, 1971.
2.26 *Phänomenologie und Theologie* (1927, 1954), Frankfurt: Klostermann, 1972.

Major lecture courses and manuscripts

Published in Heidegger's *Gesamtausgabe (Collected Edition),* Frankfurt: Klostermann:
2.27 *Phänomenologische Interpretationen zu Aristoteles* (1921–2), ed. W.Bröcker and K.Bröcker-Oltmanns, *GA* 61, 1985.
2.28 *Ontologie: Hermeneutik der Faktizität* (1923), ed. K.Bröcker-Oltmanns, *GA* 63, 1988.
2.29 *Platon: Sophistes* (1924–5), ed. I.Schüssler, *GA* 19, 1992.
2.30 *Prolegomena zur Geschichte des Zeitbegriffs* (1925), ed. P.Jaeger, *GA* 20, 1979.
2.31 *Logik: Die Frage nach der Wahrheit* (1925–6), ed. W.Biemel, *GA* 21, 1976.
2.32 *Die Grundprobleme der Phänomenologie* (1927), ed. F.W.von Hermann, *GA* 24, 1975.
2.33 *Phänomenologische Interpretation von Kants Kritik der reinen Vernunft* (1927–8), ed. I.Görland, *GA* 25, 1977.
2.34 *Metaphysische Anfangsgründe der Logik* (1928), ed. K.Held, *GA* 26, 1978.
2.35 *Die Grundbegriffe der Metaphysik: Welt, Endlichkeit, Einsamkeit* (1929–30), ed F.-W.von Hermann, *GA* 29/30, 1983.
2.36 *Vom Wesen der menschlichen Freiheit* (1930), ed. H.Tietgen, *GA* 31, 1982.
2.37 *Hölderlins Hymnen 'Germanien' und 'Der Rhein'* (1934–5), ed. S.Ziegler, *GA* 39, 1980.
2.38 *Beiträge zur Philosophie: Vom Ereignis* (1936–8), ed. F.-W.von Hermann, *GA* 65, 1989.
2.39 *Grundfragen der Philosophie* (1937–8), ed. F.-W.von Hermann, *GA* 45, 1984.
2.40 *Grundbegriffe* (1941), ed. P.Jaeger, *GA* 51, 1981.
2.41 *Hölderlins Hymne 'Andenken'* (1941–2), ed. C.Ochwaldt, *GA* 52, 1982.
2.42 *Hölderlins Hymne 'Der Ister'* (1942), ed. W.Biemel, *GA* 53, 1984.
2.43 *Parmenides* (1942–3), ed. M.S.Frings, *GA* 54, 1982.

CHAPTER 3
Philosophy of existence 2

Sartre

Thomas R.Flynn

Born 21 June 1905, in Thiviers (Dordogne), Jean-Paul Sartre was raised in the Parisian home of his widowed mother's parents. After his mother's remarriage, he spent several years with her and his stepfather in La Rochelle but returned to the capital to continue his education, first at the prestigious lycées Henri IV and Louis-le-Grand, and then at the renowned Ecole Normale Supérieure. After several years of teaching in various lycées, interspersed with a year of research at the French Institute in Berlin (1933–4), mobilization during the Phoney War (1939–40), and internment in a prisoner of war camp (1940–1), Sartre abandoned teaching for a career as an author and critic. He founded the review *Les Temps modernes* with Merleau-Ponty, Simone de Beauvoir and others (1944), refused the Legion of Honour (1945) and the Nobel Prize for Literature (1962), and became increasingly involved in the politics of the left in the second half of his life. Sartre adopted a former student, Arlette Elkaïm (1965), who had become his literary heir. He died in Paris on 15 April 1980.

Perhaps no one in the twentieth century better exemplifies the union and creative tension among philosophy, literature and public life than Jean-Paul Sartre. His novel *Nausea* and play *No Exit* emerged in the 1940s as paradigmatic 'existentialist' pieces, for which his masterwork, *Being and Nothingness,* served as the theoretical underpinning. This last, like Darwin's *Origin of Species,* was more mentioned than read during the halcyon days of café existentialism. But its basic insights and powerful phenomenological descriptions have continued to attract a number of contemporary philosophers as well as the general reading public. Several of these themes and theses continued to direct Sartre's philosophy throughout the shifts and adjustments of the next thirty-seven years of his career. So we cannot refer to a rejection of, or a 'turning' from, his earlier thought in his later work as is often done in the cases of Wittgenstein and Heidegger respectively.

The present chapter will survey Sartre's philosophical development, analyse the fundamental concepts and principles that constitute his contribution to philosophy in eight standard fields of inquiry, and conclude with reflections on Sartre's relationship to four movements in the recent history of philosophy, namely, existential phenomenology, Marxism, structuralism and postmodernism.

PHILOSOPHICAL DEVELOPMENT

Sartre once admitted that his inspiration to write philosophy came from reading Bergson's *Time and Free Will*. The Bergsonian influence on his thought, both positive and by way of reaction, has yet to be studied in depth. But the presence of this formidable French theorist is obvious from the centrality of time and temporalizing consciousness in Sartre's published philosophical writings from the very start. These works of the 1930s, culminating in *Psychology of Imagination* (1940), exhibit both a keen sensitivity to lived experience as distinct from the mechanical or quantified phenomena of positive science (a well-known Bergsonian theme) as well as a profound opposition to the philosophical idealism of his neo-Kantian professors at the Sorbonne. His early writings also tended to take imaging consciousness as paradigmatic of consciousness in general. In fact, if Sartre is known as *the* philosopher of freedom in our times, he could with equal justification be considered *the* philosopher of imagination. We shall observe various forms of imaging consciousness emerge in the course of our essay.

Sartre's long-time companion, Simone de Beauvoir, relates the story of their meeting with Raymond Aron after the latter's return from a year in Berlin. At Aron's account of the new philosophy of Edmund Husserl that could describe 'phenomenologically' an individual object such as the cocktail glass before them, she recounts, Sartre 'turned pale with emotion'. As they left the café, she recalls, Sartre had to find a bookstore open at night in order to purchase a copy of Levinas's *The Theory of Intuition in Husserl's Phenomenology*.

If phenomenology enabled Sartre to philosophize about concrete, individual reality, its central concept of intentionality allowed him to escape the 'principle of immanence' that entangled idealist philosophers in a mind-referring world. Philosophical idealism claims that reality is essentially mental or mind-referring. Berkeley's famous maxim 'To be is to perceive or be perceived' illustrates this view. Sartre published an essay in 1939 that countered this idealist claim with the principle of *intentionality,* namely, that consciousness is essentially other-referring: 'All consciousness is consciousness *of* another.' He applied this Husserlian principle with characteristic rigour, even directing it against Husserl himself, whom he accused of sliding into idealism by appeal to a 'transcendental' ego.

Sartre's robust realism continued to shape his epistemological claims over the years. He always insisted that we can know the real world in itself, that historical facts are not the result of our individual or collective creation, and that the harsh facticity of every situation must be dealt with, indeed, that failure to do so is simply 'bad faith'. It made him an apt, if initially reluctant, convert to philosophical materialism in the 1950s. Of course, mechanistic materialism was never a temptation. He had consistently opposed its claims from the start. But once he could separate the emergent features of dialectical materialism from its quasi-mechanical use by Marxist 'economism', he appealed to the 'material conditions of history' that Marxists of all shades respected and undertook to incorporate these socio-historical considerations into his philosophy of individual freedom-responsibility.

The Second World War was the dividing point between the phenomenological existentialist Sartre and his Marxist existentialist avatar. As he said in one of his many interviews, his 'experience of society' during those years forced him to shift from a philosophy of consciousness to one of *praxis,* understood roughly as human action in its

material, socio-historical environment. If it is a mistake to see the early Sartre as an unqualified phenomenologist, witness his rejection of a basic Husserlian concept in *The Transcendence of the Ego* (1937), it is equally erroneous to read him as a Marxist *sans phrase*. In fact, in his final decade he explicitly denied he was a Marxist, insisting that 'existentialist' would be a more appropriate label if one had to make such designations. In *Search for a Method* (1958) and the *Critique of Dialectical Reason,* vol. 1 (1960), he makes ample use of historical materialist categories and arguments. Even in his massive Flaubert study, *The Family Idiot* (1971–2), where existentialist and Marxist terms are intertwined, he seems to regard physical labour and human need as the touchstones of reality. Still, his association with *les maos* (ultraleftists) after the student uprising of 1968, and his unpublished collaborative effort with Benny Levy on yet another ethic, confirms the judgment that Sartre was and remained a *moralist*. For it was the desire to retain a place for moral assessment within social critique that attracted him to these young radicals. As he noted, in obvious disgust, 'The Communists don't give a damn about justice. All they want is power' [3.28], 76. It is his moralist tendencies more than his so-called 'Cartesianism' that locate him squarely in the French philosophical tradition.

Sartre's final interviews with Levy are much controverted. Simone de Beauvoir and Raymond Aron claim that the young man took advantage of Sartre's age and ill health to project a false image, a Sartre without critical bite, a domesticated warrior. Indeed, these conversations do read like Platonic dialogues, with Levy assuming the controlling role of Socrates. Though it would be a mistake to read these pages without reference to the development of Sartre's thought as a whole, comparison of several disputed passages with claims made in posthumously published material from different stages of Sartre's career indicates that at least some of Sartre's so-called revisions of his well-known positions were actually ideas he had defended in these other works quite independent of Lévy's purported influence. Thus his remarks about love and 'fraternity' are anticipated and developed at length in his *Notebooks for an Ethics* (written 1948–9), as we shall see. Again, this does not mean that Sartre 'renounced' his existentialist philosophy in his final years. Nothing could be farther from the truth. But it does reveal Sartre as a living, evolving thinker, responding to the everchanging challenges of his day. For Sartre, to philosophize was his way of being-in-the-world.

PHILOSOPHICAL CONTRIBUTIONS

Existentialists have been portrayed as non- or even anti-systematic thinkers. No doubt this stems from Kierkegaard's notorious animus against Hegel's 'System' and Nietzsche's strictures against academic philosophy in general. But, unless by 'systematic' one means 'axiomatic deductive', classical existentialist thinkers like Sartre, Merleau-Ponty, Heidegger (who rejected the association) and others were rigorous and consistent theorists, who applied fundamental principles and concepts according to a clear method. Given the interlinking and cumulative nature of Sartre's thought, it is best to order our exposition according to the standard philosophical sub-disciplines. Not only will this facilitate our consideration of his massive *oeuvre,* it will also exhibit the unity and

coherence of his theoretical work.

Methodology and epistemology

Sartre had a remarkable talent for psychological description. His novels, plays and short stories were replete with arresting, insightful accounts of both typical and dramatic moments in the human condition. So it is small wonder that he was taken by Husserl's phenomenological method of 'eidetic reduction'. By a 'free, imaginative variation of examples', Husserl proposed to focus on the essence, *eidos,* or intelli-gible contour of any 'object' whatsoever. Not only physical nature, mathematical abstractions or metaphysical categories but acts of ingratitude and artistic events were likely objects for the phenomenologist's eye. Like the forensic artist's composite photograph, these reductive descriptions serve to reveal the form, figure or essence of an object, whether this be an abstract entity, like 'material object', an emotion, like 'resentment', or a particular phenomenon, like 'this glass'. At its best, such descriptive analysis reveals the essential features of the object in question, that is, those that withstand the imaginative variations to which they are subject by the describer. Descriptive phenomenology is a 'science' of what Aristotle called 'formal', not 'efficient' causes. As Husserl noted, 'phenomenology does not try to explain…but simply to get us to see'. When it is unable to generate what Husserl termed the 'intuition of essences' *(Wesensschau),* the phenomenological method must be satisfied with possible or probable opinions about the matter in question. So the first two parts of Sartre's *Psychology of Imagination* are entitled the 'certain' and the 'probable' respectively.

What we may call an epistemology of 'vision', the Husserlian legacy, remains a constant feature of Sartre's method. It accounts for some of the most arresting passages in his philosophical writings, and serves to 'concretize' some of the most abstract sections of his theoretical works. The presuppositions of Husserl's method are Cartesian, however, and Sartre's writings up to and including *Being and Nothingness* refer to a form of the *cogito* as essential to any method that would move beyond mere probability to certainty in its basic claims. The insight of individual reflective consciousness in this approach is taken as the final court of appeal in philosophical argument. Although Sartre seemed to modify this view in his later years, he never abandoned it, as is clear from his retention of the language of *Being and Nothingness* in his final work on Flaubert. A tension between this epistemology of vision and an overlapping epistemology of *praxis* renders Sartre's later philosophy problematic.

After the war, Sartre adopted a form of the dialectical method, which he had been studying in the works of Hegel and Marx during that period. Central to this approach, as he saw it, were the notions of 'finality', 'negativity' and 'time'. It is a feature of dialectical reasoning, he insists, to acknowledge 'a certain action of the future as such'. Explanation in terms of Aristotle's 'final' causality had been philosophically unpopular since Descartes. But Sartre argues that our comprehension of human activity *(praxis)* as distinct from mechanical behaviour depends on the purposes that guided the agents themselves.

He criticized philosophers since Descartes for 'failing to conceive negativity as productive', an oversight that he certainly avoided in *Being and Nothingness,* where

negativity assumes pride of place as an essential feature of consciousness as such. Sartre's dialectic differs most from Hegel's by its insistence on the primacy of individual activity in dialectical advance and in its denial of any 'end' to the dialectical process so long as consciousness/praxis sustains it. A pivotal claim, and the undoing of any totalitarian theory, is Sartre's thesis that a 'totalizing' consciousness/praxis cannot totalize itself, that is, it cannot be completely absorbed in a social whole of which its totalizing activity is a part. This 'nihilating' character of consciousness in the early Sartre remains in the *praxis* of the later one to preclude any 'organicist' or totalitarian tendencies in his social thought.

The later, dialectical thinker prefers 'notions' to 'concepts' as the vehicles for expressing historical intelligibility. Sartre argues that developmental thinking alone can render comprehensible a fluid reality and that notions as dynamic are superior to static concepts in performing this task. Like Aristotle's and Kant's categories, concepts as such are atemporal whereas notions include an essential reference to temporality in their very meaning. We should see 'notion' as a 'dialectical concept' and read Sartre's writings after *Being and Nothingness* as abounding in them.

Sartre's discourse on method is the essay *Search for a Method,* published first as an article and later as a kind of preface to the *Critique of Dialectical Reason*. It combines the phenomenological and dialectical moments in an approach that develops the 'method of understanding' *(Verstehen)* of German social theory at the turn of the century. The method entails three stages or dimensions. The first is a phenomenological description of the subject matter to be studied. The terminus of eidetic reduction, it now forms the beginning of Sartre's approach. The second step is a 'regressive' move from the object of investigation to the conditions of its possibility. These may be purely 'formal', such as the structures of social relations that Sartre uncovers in the *Critique of Dialectical Reason,* vol. 1, or they may include a specific content, like the intrafamilial relations of the young Flaubert that conditioned his psychosocial development. The third move in what Sartre calls his 'progressive-regressive' method is the progressive spiral of interiorization/exteriorization of these material and formal conditions by the agent whose meaning-direction *(sens)* we are attempting to uncover. If successful, the progressive-regressive method enables us to 'understand' (not 'conceptualize') an agent as well or even better than he or she understood himself or herself, the ideal of hermeneutical investigation since Kant.

Psychology

Sartre's first published philosophical books were in psychology: *Imagination* (1936), *Sketch for a Theory of Emotions* (1939), and *The Psychology of Imagination* (1940). Not coincidentally, they emphasize the role of the imagination in our psychic life and pursue in depth Husserl's thesis that intentionality is the defining characteristic of the mental. Both these remain influential in Sartre's subsequent writings.

His phenomenological analysis of the imagination reveals three characteristics of its structure: the imagination is a *consciousness;* like all consciousness, it is *intentional;* and it differs from perceptual consciousness in the way it 'intends' its object, namely, as absent, non-existent or *unreal*.

It is better, he argues, to speak of 'imaging consciousness' than of 'imagination' with its corresponding 'images'. The latter form of expression tends to hypostatize consciousness and to turn images into *simulacra,* 'inner' icons of some 'exterior' object. Such discourse succumbs to what Sartre calls the 'illusion of immanence' shared by realists and idealists alike. Rather, imaging consciousness should be conceived as a manner of being-in-the-world, a Heideggerian term that Sartre adopts. Intentionality avoids the paradoxes of traditional inside-outside epistemology and accounts for the relational character of consciousness. Imaging consciousness 'derealizes' the perceptual or recollected object, relating to it in the properly imaginary mode. This derealizing activity employs physical or psychic material (for example, painted surfaces or phosphenes in the case of aesthetic or oneiric objects respectively), to serve as an *analogue* for the imagined object. Sartre's concept of 'representative analogue' figures in much that is original and interesting in his aesthetic theory. It is integral to his existential 'biographies' of such 'lords of the imaginary' as Baudelaire, Genet, Flaubert and Mallarmé. For each in his own way will be portrayed as 'derealizing' the bourgeois world of his contemporaries and enticing others with his art to do likewise. A conceptual flaw that weakens Sartre's usage is his failure to explain in detail what he means by these cardinal terms, 'analogy' and 'analogue'.

These features of imaging consciousness are summarized in the following definition: 'The image is an act which intends [literally, "aims at" *(vise)*] an absent or non-existent object in its corporality by means of a physical or psychical content which is given not for its own sake but only as an "analogical representative" of the intended object' ([3.30], 25; in the French text, p. 45). It is remarkable that Sartre speaks of imaging consciousness in this first period of his writings as the locus of possibility, negativity and lack, and insists that only in the imagining act is the 'nihilation' of objects revealed (see [3.30], 243–5; French, pp. 360–1), because, in *Being and Nothingness* and thereafter, these emerge as the proper features of consciousness in general. To the extent that Sartre's early philosophy by his own admission is a 'philosophy of consciousness', it is likewise a philosophy of the imagination. Our survey of his thought and works will justify considering him *the* philosopher of the imagination as much as *the* philosopher of freedom—the title by which he is commonly designated.

His analysis of the emotions is in direct parallel with that of the image. Like images, emotions are not 'inner states' that somehow correspond to external stimuli. Neither are they reducible to their physiological expression, as some have argued. Emotional consciousness is another way of being-in-the-world. In this case, it is one that entails a physiological change as a means of relating to the world in a 'magical' manner. Emotional consciousness is 'failure behaviour' *(la conduite d'échec),* an expression that will play an important role in Sartre's biography of Flaubert. The agent, unable to change the world through rational activity, changes himself or herself in order to conjure up a world that is no longer frustrating. Thus, the golfer gets red in the face before his/her failure to escape a sand trap. Sartre reads this as conscious, that is, 'intentional', behaviour. Its purpose is to generate another world as if by magic via one's bodily changes: perspiration, increased blood pressure, agitated motions and the like—these are 'intended' to help whisk the ball on to the green. Again, Sartre's phenomenological descriptions are aimed at escaping the 'inner life' and underscoring the correlativity of

consciousness and world, psychology and ontology.

Ontology

If Sartre is a moralist, he is likewise basically an ontologist. The close relation between ethics and ontology in his thought lends it a 'traditional' flavour quite foreign to that of recent French intellectuals. His masterwork, *Being and Nothingness,* subtitled 'An Essay in Phenomenological Ontology', develops the basic categories of his theory of being (ontology) and concludes with the promise of an ethics, which never appeared in Sartre's lifetime.

Inspired by the divisions of Hegel's *Phenomenology of Spirit* but always relying on the 'apodictic' evidence of Husserl's eidetic reduction, Sartre undertakes a description of the fundamental forms of being. He calls these 'being-in-itself' *(l'être-en-soi),* 'being-for-itself' *(l'être-poursoi)* and 'being-for-others' *(l'être-pour-autrui)*. Each has distinctive characteristics and is irreducible to the others. Exploiting the proximity of phenomenology to psychology, ontology and literary 'argument', Sartre relies on powerful examples and tropes to convey his insights. In fact, his first literary success, *Nausea* (1938), both anticipates and 'works through' imaginatively the themes and theses of *Being and Nothingness,* published five years later.

Being-in-itself or the non-conscious is the inert plenum. It is self-identical and without the features commonly ascribed to being in realist ontologies. For example, it is neither active nor passive, is beyond negation and affirmation (other than the judgment that it is and is self-identical), knows no otherness, is not subject to temporality and is neither derived from the possible nor reduced to the necessary. 'Uncreated, without reason for being, without any connection with another being, being-in-itself is *de trop* (superfluous) for eternity' ([3.2] lxvi). Sartre derives these characteristics from an initial phenomenological investigation of the being of any phenomenon. He confirms them by appeal to certain experiences like nausea and boredom that he believes are revelatory of its ontological nature.

Being-for-itself or consciousness is the counter-concept to being-in-itself and is its internal negation. It brings 'otherness' into play, is precisely non-self-identical, and is characterized as a 'pure spontaneous upsurge', a feature Sartre's concept shares with the concept of mind in classical German idealism. The for-itself 'temporalizes' the 'world' that it constitutes by its intentional relations. As we noted above, consciousness is the locus of possibility, negativity and lack. Early in *Being and Nothingness,* Sartre undertakes an analysis of our act of questioning, a tactic doubtless learned from Heidegger's *Being and Time,* with which his book has several affinities. His descriptive analysis concludes that the negativity which permeates our lives from the fragility of objects to the absence of friends is not dependent on the act of judging—the standard view—but conversely. We have 'a certain prejudicative comprehension of non-being' ([3.2], 7), and it is this that grounds the negative judgments and realities *(négativités)* that populate our world. Sartre proceeds to argue that this 'nihilating' relation of consciousness to the world is possible only because consciousness (the for-itself) is of its very nature a no-thingness *(néant),* an 'othering' relation that holds the in-itself ('thingness') at bay even as it conspires with being-in-itself to constitute the

existential 'situation'.

The essence of consciousness as the internal negation or no-thingness of being-in-itself accounts for many of the paradoxes that abound in Sartre's ontology. Chief among these is the claim that 'human reality' (his translation of Heidegger's *Dasein*), 'is not what it is…and is what it is not' ([3.2], 123). Human reality 'is' its ego, its past, its 'facticity', in the manner of not-being these givens of its situation, that is, as the internal negation of being-in-itself. Metaphorically, the for-itself 'secretes' nothingness *(le néant)* or otherness between itself and whatever predicate one might wish to ascribe to it. These verbal twists are meant to capture the ephemerality of the for-itself, a transitivity which echoes that of temporality, which the for-itself constitutes.

Following Heidegger, Sartre distinguishes lived or *ekstatic* temporality from the 'universal time' measured by chronometers. The latter is quantitative and homogeneous; the former, qualitative and heterogeneous. Being-for-itself is not 'in' time the way a hand is in a glove, or even the way the glove is 'in' time. Rather, it 'temporalizes' the world which it constitutes. The for-itself 'exists' in three temporal *ekstases:* the past as facticity or 'already', the future as possibility or 'not yet', and the present as 'presence to' or the 'othering' relation that at once unites and distinguishes the for-itself from being. These are three structured moments of an original synthesis. Sartre insists that it is better to accent the present *ekstasis* rather than the future as Heidegger does, because presence-to best exemplifies the internal negation of being-in-itself, which is the total synthetic form of temporality ([3.2], 142).

When one moves from the abstractions of the in-itself and the for-itself to the concrete individual agent, these functional concepts, being-in-itself and being-for-itself, assume the roles of 'facticity' and 'transcendence' respectively. Every individual is a being-in-situation and 'situation' is a vague, indeterminate mix of the givens, including one's physical and cultural environment as well as one's previous choices, on the one hand, and the project that moves beyond them, on the other. These givens must be reckoned with, but, Sartre insists, they are not determining. 'One can always make something out of what one has been made into' is the maxim of Sartrean humanism. The first half of his career was spent explaining the first portion of that remark; the remainder was devoted to articulating how society and history have limited our choices without removing them entirely.

Although Sartre insists that being-for-others is as fundamental as the in-itself and the for-itself, it is clearly dependent on them ontologically. In one of the most famous passages of *Being and Nothingness,* he offers his 'proof for the existence of other minds in the form of an eidetic reduction of shame-consciousness. After criticizing the adequacy of traditional arguments from analogy to account for the certainty with which we believe in the existence of other minds, he performs an 'imaginative reconstruction' of an example to reveal how such certainty figures essentially in our experience of shame.

He imagines someone looking through a keyhole at a couple. Like all Sartrean consciousness, the couple's consciousnesses are objectifying one another in a reciprocal gaze. The voyeur is a 'pure' consciousness, seeing but unseen, objectifying but unobjectified, whereas they are in a mutual relation of looking/looked at, unaware of the third party. Suddenly, the interloper hears a noise from behind. In one and the same reaction of shame, one experiences the *other as subject* and oneself objectified. In other

words, one's experience of shame is analysable into the condition of its possibility, namely, one's embodiedness-as-perceived by another consciousness. One cannot be objectified except by another subject, nor is it possible to feel shame except as an embodied being. Even if the noise turns out to have been a false alarm, the mere rustling of the curtains, for example, the agent has had an immediate experience of another *as subject;* it is written in the blush on his/her face. This 'proof of other minds is experiential. Rather than the probability of some weak analogy, it yields the certainty of the *Wesensschau*.

After establishing the existence of other minds, albeit in a general, 'pre-numerical' manner that renders my being for-others the precondition of my being objectified by any subject in particular (see [3.2], 280–1), Sartre directs his ontological investigation to each of the conditions for that experience, namely, the body and the other subject.

There are three dimensions to bodily being-in-the-world, namely, the body as for-itself, as for-others, and as what Sartre calls the way I 'exist for myself as a body known by the Other' ([3.2], 351). The absurdities of the mind-body problem, Sartre believes, stem from failure to respect these ontological levels regarding the body and in particular from beginning our analysis with the body-for-others. The latter approach sees body as a thing among things and hence as externally related to consciousness and to other bodies. Sartre begins, on the contrary, with body as being-for-itself, that is, as my way of being-in-the-world. As such, body is 'lived' (pre-reflectively) and not 'known' (reflectively), it is the absolute centre of instrumentality that I am, rather than an instrument that I employ, and it is at once my point of view and my point of departure for acting in the world. Hence Sartre can claim that 'being-for-itself must be wholly body and it must be wholly consciousness; it can not be *united* with a body' ([3.2], 305). Sartre's peculiar kind of 'materialism' depends on defending a body that is likewise wholly intentional, that is, that is not simply externally related to the projects by which an agent is individuated. Accordingly, body is integral to the existential 'situation' and is the vehicle by which other 'necessary contingencies' of our situation such as our race, our class and our very past figure in the mix. In other words, body as being-for-itself is the basic form of our facticity.

Once we have phenomenologically described our way of 'existing' our body, there is no temptation to misread the body-for-others as a thing among things. The latter now appears as the Other's *flesh,* a term elaborated by Merleau-Ponty and designating for Sartre 'the pure contingency of [the Other's] presence' ([3.2], 343). What he calls 'the pure intuition of the flesh' is especially evident in the Other's face (aclaim that invites comparison with that of Levinas regarding the primacy of the Other and the ethical significance of the face in this revelation). The body is thus revealed as a 'synthetic totality of *life* and *action'* ([3.2], 346, emphasis his).

The third ontological dimension of the body, for Sartre, is 'my body as known by the Other'. This denotes that real but uncontrollable aspect of our being-in-the-world before others—the poet's 'as others see us'. If shame-consciousness reveals the existence of other subjects, affective structures such as shyness indicate a vivid awareness of my body not as it is for me but as it is 'for the Other'. Significantly, Sartre insists that language shows us abstractly the principal structures of our body-for-others. We shall observe him subsequently locate language among the 'practico-inert'. This relation between language

and body-for-others is a suggestive dimension of Sartre's ontology yet to be fully explored.

The social dimension of Sartre's vintage existentialism elaborates our being-for-others as well as the facticity of our being-in-situation. His famous analysis of our basic relations to each other as an attempt to 'assimilate the Other's freedom' through sadistic or masochistic manoeuvres scandalized the public and contributed to his reputation for pessimism in the late 1940s. This was reinforced by the well-known line from his play *No Exit* (1944), that 'Hell is other people' *(l'enfer, c'est les autres)*.

Although he later contextualized these remarks, along with the passages in *Being and Nothingness* on which they form a gloss, as referring to interpersonal relations 'in an alienated society' such as ours, the source of the difficulty and the obstacle to a more satisfactory social theory is ontological, not historical: his looking/looked-at model for interpersonal relations. Until this is surpassed in the *Critique of Dialectical Reason,* Sartre can offer us at best a theory of the other writ large, but not a social philosophy properly speaking.

Ethics

It is now common to divide Sartre's ethical thought into three phases: the ethics of authenticity of his vintage existentialist years, the dialectical ethics that he began to formulate in the 1950s and 1960s, and the 'ethic of the we' that he was fashioning with Benny Levy toward the end of his life. Since the first is his best known and most fully articulated theory, we shall concentrate on the ethics of authenticity.

If there is any existentialist 'virtue', it has been remarked, it is authenticity. The basis for this concept is appropriately ontological: 'man is free because he is not a self but a presence-to-self' ([3.2], 440). In other words, human reality is a 'being of distances'—whatever it is, it is in the manner of not-being that property, that is, as being other*than-that*. So the male homosexual's friend who urges him to 'come out' and admit what he is, in Sartre's example, is really asking him to be inauthentic, to be a homosexual 'the way a stone is a stone', that is, in the manner of the self-identity of being-in-itself. But, of course, that is precisely what he cannot do—since, as conscious, he is 'in situation' as a homosexual. He is homosexual, French, courageous, or whatever, in the manner of transcending that facticity. Still, it is *that facticity* which he transcends, 'nihilates', 'others'. The 'moral' challenge, if that word is appropriate, is to live that tension from day to day. One can no more resign oneself to complete identity as a homosexual than the reformed gambler or alcoholic can rest secure in his or her 'sobriety' after years of success. What others see as pessimism Sartre proclaims as hope: we are not condemned by our upbringing, our characters or our past behaviour; we are freed from determinisms of every kind; we can always make something out of what we have been made into.

Perhaps Sartre's best description of 'authenticity' published in his lifetime is found in *Anti-Semite and Jew* (1946): 'Authenticity consists in having a true and lucid consciousness of the situation, in assuming the responsibilities and risks it involves, in accepting it in pride or humiliation, sometimes in horror and hate' ([3.1], 90). What emerges from existentialism in general and from Sartre in particular is authenticity as an ethical *style*. Its elements are: first, a heightened awareness of *facticity* and *possibility,*

that is, of the existential situation; second, the exercise of creative *choice* of self within this situation; and finally, *owning* or appropriating the consequences of this choice, that is, of the altered situation, the altered self. As he remarks in his posthumously published *Notebooks for an Ethics* (1992), 'It is this double, simultaneous aspect of the human project, gratuitous at its core and consecrated by a reflective reprise, that makes it into *authentic existence'* ([3.26], 481). This is not *amor fati*. Simply to resign oneself to one's facticity is a lie, for it denies that other dimension of the existential situation, transcendence or consciousness, which must sustain the resignation and thereby leave rebellion a constant possibility. Rather, authenticity is the challenge to 'have the courage to go to the limits of ourselves in both directions at once' ([3.32], 599). This is the moral Sartre draws from the biography of his 'hero' of authenticity, Jean Genet.

The ambiguity of 'situation', its indeterminate mélange of facticity and transcendence, reflects the now-self-coincidence of human reality. It makes ontologically possible 'bad faith', the best known of Sartrean moral categories. There are two basic forms of bad faith, depending on whether the individual flees the anguish of his or her freedom-possibility for identification with facticity (for example, the alcoholic who is 'cured' once and for all) or denies the force of circumstances to float in the realm of pure possibility (like James Thurber's Walter Mitty). Each is a kind of 'lie to oneself, which, of course, is impossible unless one introduces another kind of otherness or inner distance into human reality, namely, one that affects consciousness itself.

Sartre discovers a twofold duality in the human way of being: ontological (presence-to-self) and psychological (levels of consciousness). The former accounts for the otherness that infects our very being; the latter divides our awareness such that we can be conscious without 'knowing' it. The former constitutes the split; the latter renders possible the self-deception. In *Being and Nothingness,* he speaks of 'pre-reflective' and 'reflective' consciousness. The former is our immediate experience of the other, our being-in-the-world. It is *ekstatic* and pre-personal in the sense that it is not closed in on itself but is 'already in the world' when reflection intervenes. With reflection comes the self (as quasi-object of reflection), the concepts of 'knowledge' as distinct from the notions of 'understanding', which are rooted in the pre-reflective, and the objects of deliberation to which one turns when 'making up one's mind'.

Significantly, the pre-reflective enjoys both an epistemic and an ontological primacy. It is the level of 'fundamental project' that orients our reflective moments as well as the locus of that comprehension which accompanies every conscious act. In fact, pre-reflective comprehension functions in Sartre's thought in a manner not unlike Freud's 'unconscious', to which Sartre was notoriously opposed. The chief and crucial difference is that appeal to the pre-reflective enhances rather than diminishes responsibility for Sartre. The extreme responsibility to which Sartre holds us in his polemical writings is an application of this far-reaching concept of pre-reflective comprehension: we all understand what we are about, even if we do not reflectively know it. Awareness and responsibility are coextensive.

This virtual identification of consciousness and responsibility will strike many as hyperbolic, given the traditional conditions for moral responsibility, namely, some degree of control in addition to an element of knowledge. In the brief compass of a sub-section, it is impossible to pursue this at length, but it should be noted that Sartre is concerned

with ‘responsibility’ in the sense of being the ‘incontestable author of an event or of an object’ ([3.2], 553). What we might call *noetic* responsibility, that is, our appropriation of the meanings that constitute ‘our world’, is the ground of the other forms of responsibility that Sartre acknowledges. And here it does not seem incredible to claim that awareness and responsibility are extentionally equivalent. Sartre confirms this interpretation when he occasionally responds as a trump card: ‘Well, he or she could always commit suicide.’ The point is that, if they did not do so, they have ‘chosen’ in the existential sense the ‘world’ in which they live.

Fundamental ‘choice’ or project is both the individuating feature of existential ontology, the factor that distinguishes consciousnesses among themselves, and the totalizing aspect of human reality that renders it thoroughly responsible for its situation. Problematic as the concept is—Sartre once likened it to what psychologists mean by ‘selective attention’ (see [3.2], 462)—it is consistent with his claim that being-in-itself cannot act upon consciousness, that the for-itself is a ‘pure spontaneous upsurge’, and that consciousness is what makes motives motivate. Some have compared basic choice to R.M.Hare’s ‘decisions of principle’ in that both are prior to the principles to which one appeals in settling arguments. As Sartre puts it, when one pauses to decide, the ‘chips are [already] down’ ([3.2], 451). Fundamental choice is constitutive, not selective. It is coterminous with pre-reflective consciousness. It is a ‘choice’ which we ‘are/were’, to paraphrase a barbarism that Sartre introduces to express the transitivity and harsh facticity of lived time.

Because consciousness, choice, freedom, responsibility are roughly extentionally equivalent terms in what Iris Murdoch called Sartre’s ‘great inexact equations’, the challenge to authenticity and the consequences of inauthenticity are all-encompassing. There is a *‘Weltanschauung* of bad faith’, for example; it constitutes a manner of being-in-the-world ([3.2], 68).

In a set of unpublished manuscripts for lectures in the 1960s, Sartre begins to elaborate another, dialectical ethic. This is more socially minded than his characteristically individualist stance of twenty years earlier. It builds on his concepts of situation and the exemplarity of moral choices as well as the thesis that no one can be free if anyone is enslaved—themes addressed briefly in his earlier works. His ontological categories are those of the *Critique of Dialectical Reason* and his discussions, for the most part inchoate and sketchy, are phenomenological descriptions of moral experience, especially the following of moral norms and their violation in moments of moral crisis and creativity. The ideal is no longer the ‘authentic’ individual but ‘integral man’, understood *grosso modo* as the person who has entered into relations of positive reciprocity with others whose basic animal and human needs have likewise been met such that they are liberated from the alienating tyranny of material scarcity and the violence it engenders. These are necessarily vague notions, Sartre admits, because they gain their precision from that which they oppose, namely, what he calls ‘sub-man’ or the oppressed and oppressing individuals of contemporary society.The most that can be said of integral man in the present state of our social existence is that he or she is made possible by the continuous refusal to live as sub-man. Although Sartre cites the colonist-native relationship to exemplify the notion of sub-humanity, he has always considered this an instance of more general relations of oppressive practice and structural exploitation that characterize

bourgeois society.

Clearly, Sartre was dissatisfied with this second attempt and so in his last years undertook a third ethic in discussion with Benny Levy. Characterized by Sartre as an 'ethics of the WE', this third version remains buried in the tape-recordings in Lévy's possession. From Sartre's somewhat exaggerated accounts, we learn that this product of a *livre à deux* was to leave uncriticized not a single major thesis of his earlier philosophy. As we noted earlier, the published interviews indicate that this is not the case, though they do reveal the revival of some more 'positive' theses from earlier works such as *Notebooks for an Ethics*. In any case, these tapes, if they are ever published, will almost certainly be chiefly of biographical value and are not likely to warrant our rejecting the systematic thought of Sartre at his prime.

Existential psychoanalysis

Although it has 'not yet found its Freud' ([3.2], 575), this approach to understanding the fundamental project of an agent is followed in increasing detail in Sartre's 'biographies' of Baudelaire, Genet and Flaubert as well as in his Nobel-Prize-winning autobiography, *The Words*.

The method is an application of the ontology of *Being and Nothingness,* although it does not rely on the latter's discredited social theory. It assumes that human reality is a totalization, not a totality, and that this ongoing unity is forged by the existential project. If human reality is the 'useless passion' to coincide consciously with itself, to be in-itself-for-itself, that is, if each of us exemplifies the famous futile desire to be God, then psychoanalysis exercises an hermeneutic on the signs of an individual's life that indicate its distinctive manner of living this futile desire—whether authentically, for example, or inauthentically. Because pre-reflective consciousness has replaced the Freudian unconscious, Sartre considers it possible in principle to understand an individual completely, that is, to uncover his or her self-defining project in complete transparency. Like so many of the claims enunciated at the height of existentialist enthusiasm, the ideal of total transparency is qualified in Sartre's later works, where force of circumstance ('what we have been made into') modifies absolute freedom and ideology clouds individual awareness. But he remained true to theRousseauian concept of personal and social transparency, at least as an ideal.

The details of Sartre's love-hate relationship with Freud have yet to be recounted. On the one hand, he rejected the Freudian concept of the unconscious as being deterministic, and criticized Freud's 'censor' for being in bad faith (it both knows and does not know what is acceptable to consciousness). And yet he employs the concept of pre-reflective consciousness in a manner that imitates Freudian unconscious in important ways and allows the analyst to reveal to the analys-and meanings which he or she had hitherto not known (in a reflective sense). Preparing the never-to-be-filmed script for a John Houston movie, later published as *The Freud Scenario,* forced Sartre to rethink his ideas about the unconscious. He acknowledged finding Lacan's theory of the unconscious structured as a language less troublesome but did not go so far as to embrace the idea. As always, the concept of individual freedom-responsibility remained a non-negotiable.

Sartre's most ambitious exercise in existential psychoanalysis and most thorough use

of the progressive-regressive method is his massive study of the life and work of Gustave Flaubert, *The Family Idiot* (1971–2). Numbering over three thousand pages in the original, it constitutes a kind of *summa* of Sartre's intellectual endeavours, embracing everything from ontology and psychoanalysis to literary and social criticism. It addresses the question, 'What at this point in time, can we know about a human being?' ([3.15], French, vol. 1, p. ix). A synthesis of existential psychoanalysis and historical materialism, the progressive -regressive method seeks to uncover Flaubert's basic project, namely, his 'choice' of the unreal-imaginary through adopting the 'neurotic' lifestyle that bourgeois society thrust upon any would-be artist of Flaubert's generation. As becomes usual in the second phase of Sartre's career, biography has broadened into social critique. What is both banal and profound in Sartre's undertaking is his attempt to comprehend Flaubert's life and times through the dialectical relationship between his progressive 'personalization' and the production and public reception of *Madame Bovary*. It is a commonplace to study the 'life and times' of a historical figure in mutual clarification. But there is something boldly 'rationalistic' about Sartre's attempt to understand why Flaubert had to write *Bovary* and how he could finally claim, 'I am Madame Bovary.'

Philosophy and literature

No thinker in our century more adequately brokers the marriage of these two disciplines than Sartre. His novels, short stories and plays gave him an audience denied to most philosophers, and his criticism, gathered with occasional pieces in the ten volumes of *Situations,* established him as a major voice in that domain. This was furthered by the journal of opinion and criticism, *Les Temps modernes,* which he founded at the end of the war. In a collection of articles published first in that journal and later as a book, *What is Literature?* (1947), Sartre defends his concept of 'committed literature' *(littérature engagée)*. Given his ontological theses of the fundamental project and the possibility of bad faith, Sartre examines literary art in terms of the authenticity and inauthenticity, not merely of its content (which would smell of socialist critiques) but of its very form.

He distinguishes prose from what he calls generically 'poetry' and insists that the latter cannot be committed. Poetry employs its 'analogues' (words, musical sounds, painted surfaces and the like) as ends in themselves. They do not point beyond themselves to our being-in-the-world but undertake to short-circuit that outward movement by rendering the aesthetic object present-absent, that is, imaginatively present, for its own sake. We might say that, for Sartre, where prose looks beyond the pointed finger to the object indicated, 'poetry' focuses on the fingertip. If not precisely escapist, such art avoids the challenges of a period of crisis. Sartre believes that the postwar years form such a period. Hence his recommendation that artists should address social concerns and do so in a manner that 'gives the bourgeoisie a bad conscience'. Once he appropriates this advice himself, ironically about the time the Nobel Committee is preparing to award him the prize for literature, he all but abandons imaginative literature except for an adaptation of Euripides' *The Trojan Women* (1965) and his 'novel that is true' about Flaubert. And yet this very move to committed literature reveals that the distinction between poetry and prose is functional rather than substantive in the final analysis and that imaginative 'derealization' can constitute a form of social action even in genres that Sartre seemed to

have dismissed as 'poetic'. In fact his early (1948) praise of black poetry in French as 'the only great revolutionary poetry of our time' ([3.36], vol. 3, p. 233) indicates that he had understood his original distinction in a functional manner from the start.

At this point we should summarize the elements of Sartre's aesthetic theory. Its foundation is the theory of imaging consciousness developed in *Psychology of Imagination*. It applies intentionality to the constitution of an 'aesthetic object' for which the physical artefact serves as *analogon*. Both cognitive and affective 'intentions' conspire to 'presentify', that is, to render imaginatively present-absent the object in an aesthetic mode. In the case of non-figurative art, the artefact serves as analogon for itself. Words or their grammatical and syntactical configuration form the analogue of the literary object, a 'world' with its proper space and time that is a 'derealization' of our real world of *praxis*. Given both the paradigmatic nature of imaging consciousness for Sartre and the extensional equivalence of 'consciousness' and 'freedom', it is not surprising to find him discussing the work of art as an 'invitation from one freedom to another' and interpreting artistic creativity as an act of generosity. In fact, invitation-response replaces command-obedience as the model for ideal social relations in Sartre's 'city of ends', as we shall now see.

Social philosophy

In his 'biography' of Jean Genet, Sartre avows: 'For a long time we believed in the social atomism bequeathed to us by the eighteenth century…. The truth is that "human reality" "is-in-society" as it "is-in-the-world"; it is neither a nature nor a state; it is made' ([3.32], 590). As we noted earlier, the possibility of developing an adequate social theory was hampered by Sartre's looking/looked-at model of interpersonal relations. At best, this ontology warranted the methodological individualism that his erstwhile friend Raymond Aron ascribed to him in the social realm. But by subsuming his philosophy of consciousness into one of praxis, Sartre increases qualitatively the social potential of his thought. Whereas there is no such thing as a plural look, except as a merely psychological experience (a basic claim of methodological individualists), there is a 'synthetic enrichment' of my action when it is incorporated into that of a group. 'We' can do many things that remain impossible for me alone.

Sartre's major contribution to social philosophy is made at the level of social ontology, the theory of individual and group identity and action. It takes the form of two concepts, the *practico-inert* and the *mediating third*. But to explain each we must first elucidate the notion of *praxis,* which is the pivot on which his social theory turns.

P*raxis* denotes purposive human activity in its cultural environment. It is distinct from human action *sans phrase* in being historical; its 'world' is a horizon of meanings that are already 'there', yet liable to interpretation in light of the ongoing project. But whereas the Husserlian discourse of intentions, meanings and noetic responsibility dominated the landscape of *Being and Nothingness,* Sartre displays a marked preference for the language of historical materialism in the *Critique of Dialectical Reason*. The basic form of praxis is *labour* as a response to material need. This original relationship overcomes whatever lingering idealism Sartre's theory may have been liable to and generates a dialectic of negation, negation of negation, and transcendence *(dépassement)* adapted

from the Hegelio-Marxist tradition. If the early Sartre left the impression that one could simply change oneself rather than change the world, since the terms were correlative in any case, such 'Stoic' freedom is strongly opposed by the later Sartre, and the factical component of one's situation is finally given its due.

Functional heir to being-in-itself, the 'practico-inert' refers to the facticity of our social situation in its otherness, especially the material dimension of our cultural environment, as well as to those sedimented *past praxes* that return to haunt us. If the act of speaking is an instance of *praxis,* language is a form of the practico-inert. This is the category of 'counterfinality' whereby intended ends entail unintended consequences. Sartre's classic example is the deforestation by Chinese peasants that resulted in the very erosion from floods of the land they hoped to cultivate. Similarly, he employs this concept in his account of the impoverishment of the Spanish state through inflation caused by its hoarding of gold from its newly exploited American mines. Practicoinert 'mediation' is alienating, it steals one's activity the way the 'look' of the Other robs one of one's freedom in *Being and Nothingness*. And when qualified by material scarcity, practico-inert mediation renders human relations violent. Sartre describes violence as 'interiorized scarcity'. The fact that there is not enough of the goods of the world to go around colours human history as a tale of violence and terror. Towards the end of his life, Sartre admitted to Benny Levy that he had never reconciled these fundamental features of social life, fraternity and violence. Both are essential to his social thought.

'Fraternity' is Sartre's term for the mutuality and positive reciprocity that constitute his social ideal and which are achieved, albeit temporarily, in the spontaneously formed action group. Most relations are 'serial' because they are mediated by the practico-inert. Most of the individuals who populate our world, from the television-viewing public to the people waiting for the same bus, are rendered serial by the 'false' or 'external' unity imposed on them by such collective objects as a television announcer or an expected bus. They are related among themselves as 'other' to 'other'—as competitors for scarce space, for example, or as fashioning their opinions as the newscaster dictates. Sartre notes that such 'serial impotence' is cultivated by dictators who wish to maintain an illusion of power on the part of their subjects in the midst of the latter's profound malleability.

In the 'apocalyptic' moment when people realize in a practical manner through a common project that they are 'the same', not 'other', and that each is performing the task which the other would do were he or she required to do so at this point, the 'We' emerges in a fusing group. Sartre's idealized example of such a genesis is the famous storming of the Bastille. Under threat from an external source, the crowd changes from serial dispersion to practical unity, from a mob to a group. By a performative utterance that effects what it describes, the cry 'We are a hundred strong!' in Sartre's imaginative reconstruction of the event creates a new entity: the fused group. The *mediating Third* is the ontological vehicle for this transformation. Unlike the objectifying voyeur of *Being and Nothingness,* the third party in group formation performs a mediating, not an alienating function. By subordinating purely personal or divisive concerns to general interest, he or she emerges as the 'common individual'. Mediation is exercised no longer via the practico-inert but by means of the *praxes* of 'common' individuals. Complete organic integration is impossible, Sartre continues to insist; some otherness always remains. But it is 'discounted', not fostered. He calls it 'free alterity' of the group in

praxis as opposed to the serial otherness of the impotent collective.

A threefold primacy of *praxis* emerges in Sartre's later thought. At the ground is an *ontological* primacy. Even at the highest moment of social integration, the group-in-fusion, it is organic *praxes* who create and sustain the group. The entire 'inner life' of the group is a revolving circle of practical relations whereby each *praxis* 'interiorizes' the multiplicity of the rest. (Any member could have cried 'We are a hundred strong!') Even the practico-inert is not an autonomous force that renders us powerless. It is, after all, *practico-inert;* the *praxes* that it absorbs or deflects are still operative, though in alienated fashion. Sartre explicitly adopts the Marxist thesis that 'there are only individuals and real relations among them' ([3.35], 76). If Sartre's early work was a relentless rejection of idealism, his later, social theory is intent on avoiding organicism. The ontological primacy of *praxis* is his chief weapon in that campaign.

On this original primacy Sartre founds an *epistemological* and an *ethical* primacy as well. The epistemological primacy of *praxis* stems from the fact that comprehension is the consciousness of *praxis* and that we can comprehend the other's comprehension through the progressive-regressive method. This is an elaboration of the *Verstehende* sociology of Dilthey, Weber and others, placed in service of an historical materialist conception of social change. But unlike Marxist 'economism', the comprehension Sartre seeks comes to rest in the *praxisproject* of the organic individual. Sartre summarized the difference in a memorable line: 'Valéry is a petit bourgeois intellectual…. But not every petit bourgeois intellectual is Valéry' ([3.35], 56).

Because individual *praxis* sustains the most impersonal economic laws, like the 'iron law of wages', and the most 'necessary' practicoinert processes, such as the colonialist system, one can ascribe existential-moral responsibility to the serialized 'agents' whose passive activity carries them out. In other words, one cannot escape responsibility by appeal to facticity. For Sartre the moralist, the spark of human freedom-responsibility is unquenchable: you can always make something out of what you have been made into.

Philosophy of history

A glance at the posthumously published *War Diaries* which Sartre kept during the Phoney War of 1939–40 reveals that his interest in the topic was not the result of his so-called conversion to Marxism after the war. But he does set the matter aside in *Being and Nothingness,* reserving a lengthy discussion of morality and history for his *Notebooks for an Ethics,* again not published in his lifetime. In the *Diaries,* his dialogue is primarily with Raymond Aron, whose two volumes on the philosophy of history had just been published. In criticism of Aron, Sartre enunciates a thesis that will be formative of his existential approach to history ever after: the only way to achieve historical *unity* is by studying the lived appropriation of historical events by an individual agent. What is being sketched at this early stage is the rationale of his existential psychoanalyses of the next decades. If history is to be more than the positivist concatenation of facts and dates, it must come to life in the projects of the historical agent. This is more than psychohistory, to which it exhibits a marked resemblance, because of Sartre's characteristic moral concerns as well as the historical materialist dimension which he will introduce after the war.

In the *Notebooks* Sartre indicates that an existentialist theory of history will have to respect the paradox of moral responsibility. At this stage the dialogue is with Hegel and the French Hegelians, Kojève and Hyppolite. The existentialist individual makes an 'end' to history inconceivable: any totality of which consciousness is part will be a 'detotalized' totality. Although he speaks of positive reciprocity, the generosity-gift relationship and good faith in ways that correct the one-sided, pessimistic view of interpersonal relations conveyed in *Being and Nothingness,* these notes remain in thrall to the looking/looked-at model of the social. Accordingly, the theory of history is faced with seemingly insurmountable difficulties as it attempts to interrelate the individual and the social, morality and history.

It is in the two volumes of the *Critique of Dialectical Reason,* where the dialogue is now with Merleau-Ponty's criticism of his social thought in the latter's *The Adventures of Dialectic,* that Sartre formulates the philosophy of *praxis* and its attendant social ontology that enable him to construct a theory of history that accounts for collective action and counterfinalities, recognizes the specificity of the sociohistorical, and reserves pride of place for existential-moral responsibility on the part of organic individuals. Since his *War Diaries,* it has been clear that the root problem for an existentialist theory is the relationship between biography and history. He treats this matter apropos of Joseph Stalin and the Soviet Union in the 1930s in his posthumously published notes for volume 2 of the *Critique,* but the relation of biography to history receives its most extended consideration in *The Family Idiot* (especially in volume 3 of the French edition).

SARTRE AND TWENTIETH-CENTURY CONTINENTAL PHILOSOPHY

Although one of the few major twentieth-century philosophers not to be associated with academe for most of his career, Sartre was professionally trained and remained in dialogue with academic philosophy all of his life. Any assessment of his thought should address his relationship to the leading philosophical movements of his time.

Existential phenomenology

It was Gabriel Marcel who first called Sartre an 'existentialist'. By the time of his famous public lecture, *Existentialism is a Humanism* (1945), his name had become synonymous with the movement. Indeed, it was in part to separate himself from association with Sartrean existentialism that Heidegger denied he was an existentialist and wrote his groundbreaking *Letter on Humanism* (1947) to explain why. We have noted Sartre's debt to Husserlian phenomenology throughout this chapter. In *Being and Nothingness* he criticizes Hegel, Husserl and Heidegger at several junctures but clearly has adopted numerous concepts from each. While it is a gross exaggeration to characterize Sartre's masterwork as *'Being and Time* translated into French', the similarities as well as the profound differences between each thinker are underscored by comparing the two works. As soon as a French translation of Heidegger's 1930 lecture *The Essence of Truth* appeared (1948), Sartre wrote a lengthy response. It was published posthumously as *Truth and Existence* (1989).

Sartre was a close collaborator with Simone de Beauvoir in the sense that they read each other's work prior to publication, and she completed several of the lacunae in his social ethic in the mid-1940s with her *The Ethics of Ambiguity*. Despite its obvious originality, Merleau-Ponty's *The Phenomenology of Perception* shows numerous signs of Sartrean influence, even as it takes Sartre to task for his 'Cartesianism'. But we noted that the *Critique* seems to be a response to the trenchant criticism levelled by Merleau-Ponty in his *Adventures of the Dialectic* against a Sartrean social philosophy. Sartre's indebtedness both to Merleau-Ponty and to Kierkegaard is recounted in memorial essays he penned in honour of each ('Merleau-Ponty Alive' (1961) and 'Kierkegaard: The Singular Universal' (1966)).

The 'existential turn' that Husserl's phenomenological movement took, if initiated by Heidegger, was completed by Sartre. To the extent that such phenomenology grew increasingly anthropological and ethical, it became associated with its French practitioners. The phenomenological method was enriched and its limitations as an approach to history were compensated for by the progressive-regressive method. This last, as we noted, is a synthesis of existential psychoanalysis and historical materialism. The former places it in direct line with the hermeneutic tradition of interpreting symbolic action; the latter relates Sartre's method to more 'scientific' (in the Hegelian sense) approaches to historical intelligibility.

Marxism

Sartre's 'Marxism' was always adjectival to his existentialism. In the late 1940s, he advised the workers to support the Communist Party *faute de mieux,* while refusing to join it himself. In *Search for a Method,* he declares Marxism 'the philosophy of our times' and even makes it synonymous with 'knowledge' *(savoir)*. But he described the *Critique of Dialectical Reason,* to which *Search* served as a kind of preface, as an 'anti-communist book' and in his last years explicitly denied he was a Marxist. Still, historical materialism (the Marxist theory of history) is operative in *The Family Idiot* as well as in his other writings after the late 1950s.

Sartre joins that group of Marxists known as 'revisionists' in that they question or reject totally the Marxist dialectic of nature (DIAMAT) and emphasize the humanistic dimension of Marx's writings. In *Search for a Method,* Sartre announces that his mission in this regard is 'to conquer man within Marxism' ([3.35], 83). It is because of their failure to respect the moral dimension of human action, that Sartre abandoned even fellow-travelling in favour of *les maos* after the events in Paris of 1968. This odyssey is recounted in his discussion with two members of that group, published as *On a raison de se révolter* (1974).

Structuralism

The structuralist movement in France as exemplified by the work of Althusser, Lacan, Lévi-Strauss, Barthes and others in the 1960s is commonly credited with having replaced existentialism as the reigning Parisian 'philosophy'. This is true to a large extent, though that school of thought was subsequently eclipsed by poststructuralist writers. Sartre

occasionally criticized the structuralists for ignoring history in general and human agency in particular—essential existentialist concerns. But even a cursory reading of the *Critique of Dialectical Reason* will reveal the important role that Sartre reserves for structural factors in his account. The 'formal conditions' revealed by the regressive movement of the progressive-regressive method are arguably structural. In fact, the major portion of volume 1 of the *Critique* is synchronic and structural. Whether it is thereby 'structuralist' depends on the meaning of the term. Clearly, Sartre opposed it as a system because of its inadequacy to existential experience. And its binary relations, he would accept only as complementing the dialectical, totalizing 'Reason' that he was elucidating in the *Critique*.

The ontological locus of structural relations in his social ontology is the practico-inert. Recall that language as such, for him, is practicoinert. So too is analytical, as distinct from dialectical, reason. Sartre speaks of the practico-inert and hence of structure as non-historical and even 'anti-dialectical'. But this must be taken in the context of the totalizing activity *of praxis,* which renders these structures historically relevant. The 'platonizing' tendencies of structuralist thought are tempered by Sartre's 'dialectical nominalism', an approach to ontology and epistemology that respects the qualitative difference between individual and collective phenomena as well as the irreducibility of the latter to the former, while insisting on the threefold primacy of free organic praxis. Dialectical nominalism is a middle ground between holism and individualism in the methodology of the social sciences.

Postmodernism

Foucault once referred to Sartre as the last of the nineteenth-century philosophers. It was not only his interest in History with a Hegelian 'H' and his seeming fixation on Flaubert that generated this remark. It was equally Sartre's philosophy of the subject, of freedom and of moral indignation that lay behind Foucault's words. And yet one can find several strikingly 'postmodern' theses in Sartre's work. These would make valuable contributions to the current philosophical conversationand deserve closer scrutiny by contemporary thinkers. By way of conclusion let us consider three.

Postmodern thinking is noted for its 'evacuation of the subject' from current discourse. In so far as the 'subject' in question is the Cartesian *res cogitans,* Sartre never held that position. His concept of 'presence to self instead of a substantial self or ego, with its attendant 'circuit of selfness' rather than an outer spatio-temporal plane, leaves Sartre free to consider the fluidity of subjectivist discourse and speak of the self as an achievement rather than an origin. The constitution of a moral 'self, to which Foucault devoted his last years, could have been the topic of a Sartrean treatise.

There is an aesthetic strain in Sartre's thought, owing to the paradigmatic role that he accords imaging consciousness. Postmodern critics from Lyotard to Foucault have shown a marked preference for aesthetic categories as well, even to the point of advocating the Nietzschean aestheticist injunction to 'make one's life a work of art'. Not that Sartre should ever be accused of aestheticism. But his reading of history is certainly 'poetic', and his existential biographies as 'novels that are true' suggest a fruitful field of future inquiry and dialogue with postmodern writers.

The Nietzschean inspiration of Sartre's thought has not received the attention it

deserves, especially since the 'postmodern' Nietzsche has emerged. Sartre's early essay 'The Legend of Truth', written in 1929, is profoundly Nietzschean in content and tone. The general problem of contingency and chance, which Foucault wished to reintroduce into postmodern historiography, was an abiding theme of Sartre's existentialist thought. It surfaces again in the posthumous *Notebooks for an Ethics*. The career of Nietzschean interpretation forms another link between Sartre and postmodern thinkers.

And yet it would be excessive to refer to Sartre as a 'postmodern'. He was a thinker of *unities,* not of fragments. His emphasis on intentional consciousness and later on totalizing *praxis* was meant to counter the historical pluralism of Raymond Aron as well as the brute facts of the positivists. And his corresponding commitments aimed at effecting socio-economic changes that would make it possible for 'freedoms' to recognize one another. He shared the neo-Stoic belief of postmoderns that one should try to maximize freedom even though there is no hope of complete emancipation. But he persevered in the hope that such a 'city of ends' might be possible and urged people to work to realize its advent. Again, we encounter the integral role of the imagination in effecting a meaning-direction *(sens)* to history.

If Sartre is to be remembered as an important and influential philosopher of the twentieth century, it will be as much for the consistency of his commitment to individual freedom as for the insights of his phenomenological descriptions and the force of his categories (bad faith, authenticity, practico-inert, and the like). When he died, the press likened him to Voltaire and noted that we had lost the conscience of our age. It is as moralist, philosopher of freedom and philosopher of the imagination that he made his most memorable contributions. Despite the Teutonic length of his sentences, especially in the later works, he was a quintessential Gallic philosopher.

CHAPTER 4
Philosophy of existence 3

Merleau-Ponty

Bernard Cullen
à Henri Godin

LIFE AND WORKS

Maurice Merleau-Ponty was born on 14 March 1908 into a petty bourgeois Catholic family in Rochefort-sur-Mer on the west coast of France. When he died suddenly, at his desk, on 3 May 1961, he was widely regarded as France's most brilliant and most profound philosopher.

After his father, an artillery officer, died in 1913, the young Maurice grew up in Paris, in the company of his mother, a brother and a sister. He told Jean-Paul Sartre, in 1947, that he had never recovered from an incomparably happy childhood ([4.99], 230). Schooled, as were all philosophy students of his generation, in a distinctively French philosophical tradition dominated by Cartesianism, he entered the most elite establishment for the study of philosophy in France, the Ecole Normale Supérieure in Paris, in 1926. It was there he first made the acquaintance of Sartre, in circumstances he was to recount twenty years later in the course of an affectionate defence of that 'scandalous author' against his detractors on the right and on the left: 'the Ecole Normale unleashed its fury against one of my schoolmates and myself for having hissed the traditional songs, too vulgar to suit us. He slipped between us and our persecutors and contrived a way for us to get out of our heroic and ridiculous situation without concessions or damages' ([4.22], 41). Simone de Beauvoir describes in her autobiographical novel *Memoirs of a Dutiful Daughter,* under the fictitious name Pradelle, her friend and fellow student Merleau-Ponty, a rather serious but optimistic young searcher after truth who still attended mass.

At the Ecole Normale, Merleau-Ponty's main teacher was the idealist Léon Brunschvicg. In the academic year 1928–9, he prepared a dissertation on Plotinus, under the supervision of Emile Bréhier. Between 1928 and 1930, he attended a series of lectures given at the Sorbonne by Georges Gurvitch on contemporary German phenomenology, especially the writings of Husserl, Scheler and Heidegger; and in February 1929, he attended the lectures given at the Sorbonne by Husserl himself, which were revised and published two years later as the *Cartesian Meditations*. One phrase from those lectures recurs as a leitmotiv throughout Merleau-Ponty's work: 'It is "pure and, in a way, still mute experience which it is a question of bringing to the pure expression of its own significance"' ([4.18], 219; cf. [4.24], 129 and [4.21], 188). The growing interest in German philosophy within Parisian philosophical circles was not confined to

phenomenology. The year 1929 also saw the publication of Jean Wahl's pioneering book *Le Malheur de la conscience dans la philosophie de Hegel (The Unhappy Consciousness in the Philosophy of Hegel)*.

After graduating in second place in the 1930 examinations for the *agrégation en philosophie* (the qualification required to prepare candidates for the *baccalauréat*) and carrying out a year's compulsory military service, Merleau-Ponty taught philosophy in *lycées* in Beauvais and Chartres. He taught himself German. (For his own account of his researches at this time into the nature of perception, together with a list of the works he read in 1933–4, see [4.60], 188–99.) In 1935, he was appointed as a tutor at the Ecole Normale, where he remained until mobilization in 1939. His first two published works, in the Catholic journal *La Vie intellectuelle,* were sympathetic critical notices of the French translation of Max Scheler's book on *'ressentiment'* (1935) and *Etre et avoir* by Gabriel Marcel (1936). (For a summary of these articles, see [4.60], 13–24.)

In the mid-1930s, he began to deepen his study of Marx, especially the writings of the young Marx. From 1935, he attended the influential lectures by Alexandre Kojève at the Ecole Pratique des Hautes Etudes on Hegel's *Phenomenology of Spirit*—a reading of Hegel deeply influenced by the writings of the young Marx, subsequently published under the title *Introduction à la lecture de Hegel*. But around this time (and until the end of 1937), he was still closely associated with the left-leaning Catholic journals *Esprit* and *Sept.* The closure of *Sept,* on instructions from the Vatican, was probably the final blow to his religious faith. In the same way, the publication in 1939 of the reports of the Moscow trials of Bukharin and twenty others the previous year must have influenced his decision not to commit himself to membership of the French Communist Party.

His minor doctoral thesis, *The Structure of Behavior,* was completed in 1938 (though not published in book form until 1942). In early 1939, Merleau-Ponty became acquainted with a special issue of the *Revue internationale de philosophie* devoted to Husserl (who had died in April 1938). The references therein, especially by Eugen Fink, to Husserl's last book, *The Crisis of the European Sciences and Transcendental Phenomenology,* whetted his appetite to learn more about this work, only the first part of which had been published. At the beginning of April, he was the very first visitor to the Husserl Archive at Louvain in Belgium (whence the Husserl papers had been hurriedly moved), where he read the entirety of *The Crisis, Ideas II,* and a number of other unpublished pieces. (See [4.110].) These brief encounters undoubtedly had a decisive influence on the way in which Merleau-Ponty appropriated the later thought of Husserl and incorporated it into the heart of his own philosophy.

The outbreak of war forced Merleau-Ponty to interrupt his research. After a year as a second lieutenant, he was appointed to a post in the Lycée Carnot, where he remained until 1944, when he took over from Sartre as senior philosophy teacher at the Lycée Condorcet. In the meantime, in 1941, he had encountered Sartre again, when he joined Socialism and Liberty, one of the many groups, as Sartre put it, 'which claimed to be resisting the conquering enemy' ([4.99], 231). As Sartre tells it in his remarkably moving extended obituary, the two men immediately recognized their common interests: 'The key words were spoken: phenomenology, existentialism. We discovered our real concern. Too individualist to ever pool our research, we became reciprocal while remaining separate…. Husserl became our bond and our division, at one and the same time' ([4.99],

231).

Throughout this period, Merleau-Ponty continued to work on his principal doctoral thesis and philosophical masterpiece, the *Phenomenology of Perception,* which was accepted and published in 1945. Appointed lecturer in philosophy at the University of Lyons, he was made professor in 1948. He combined these duties with editing the left-wing, anti-colonialist journal *Les Temps modernes,* which with Sartre and Simone de Beauvoir he had founded shortly after the Liberation. (See [4.99], 247–53.) He was the journal's (anonymous) political editor and editor-in-chief, writing most of the editorials (unsigned) and many lengthy articles (signed), several of them later gathered in his book *Humanism and Terror: an Essay on the Communist Problem,* published in 1947. Others were gathered in the collection *Sense and Non-Sense,* published in 1948. According to Sartre's reminiscences, 'the review belonged to him. He had defined its political orientation, and I had followed him' ([4.99], 283). From 1949 to 1952, he occupied the chair of child psychology and pedagogy at the Sorbonne; and in 1952, at the unusually early age of 44, he was appointed to the most prestigious position for an academic philosopher in France, the chair of philosophy at the Collège de France. He gave his inaugural lecture, entitled *In Praise of Philosophy,* at the Collège on 15 January 1953.

Relations with Sartre had been cooling for some time: they disagreed deeply over the role of the Communist Party and the actions of the Soviet Union before and during the Korean War, and Merleau-Ponty resigned as editor-in-chief of *Les Temps modernes* in 1952. Almost half of the book in which, in 1955, Merleau-Ponty renounced his adherence to Marxism, *Adventures of the Dialectic,* was devoted to a merciless critique of 'Sartre and ultrabolshevism'. A further collection of essays was published under the title *Signs* in 1960. His last published work, *Eye and Mind,* had just appeared in the journal *Art de France* when Merleau-Ponty died suddenly on 3 May 1961, from a stroke, aged 53. The divisions between him and Sartre had been gradually healing. Merleau-Ponty had taken the opportunity of his Introduction to *Signs* to record in print his affectionate admiration for Sartre. He counters Sartre's harsh self-criticism (in his Preface to *Aden Arabie,* by their mutual friend Paul Nizan) with the observation that 'his accursed lucidity, in lighting up the labyrinths of rebellion and revolution, has recorded in spite of himself all we need to absolve him' ([4.23], 24). Sartre, for his part, records his surprise and delight when Merleau-Ponty unexpectedly turned up, shortly before his death, at a lecture Sartre gave at the Ecole Normale. Among his many posthumous publications, the two most important are *The Prose of the World* (notes dating from 1950–2) and the unfinished manuscript of the book on which he was working at the time of his death, *The Visible and the Invisible*.

THE PRIMACY OF PERCEPTION

In a paper he wrote in 1952 to support his candidacy for the chair of philosophy at the Collège de France, Merleau-Ponty offers a brief summary of the themes of his work thus far, before proceeding to outline his plans for future research. He begins by referring to 'the perceived world which is simply there before us, beneath the level of the verified true and the false'. His first two works, he goes on, 'sought to restore the world of

perception' ([4.21], 3). Beginning with the insight that the mind that perceives is an incarnated mind, his writings have tried to establish and illustrate the inadequacy of both behaviourism and idealism and to overcome this dualism by recourse to the fundamental reality of the perceiving body-subject.

He had already announced this programme of work in the opening sentence of his Introduction to *The Structure of Behavior:* 'Our goal is to understand the relations between consciousness and nature.' Rejecting philosophical approaches that emphasize either the 'pure exteriority' of the objects of perception or the 'pure interiority' of the perceiving subject, Merleau-Ponty insists that the world as perceived is not a sum of objects of our perception; and our relation to the world is not that of a disembodied thinker to an object of thought. What must not be forgotten is 'the insertion of the mind in corporeality, the ambiguous relation which we entertain with our body and, correlatively, with perceived things' ([4.21], 4).

This means that the classical Aristotelian/Kantian distinction between form and matter is misleading. We cannot conceptualize the world to be perceived as disordered 'matter' on which the perceiving mind (or consciousness), through the use of reason, imposes 'form' or in which it deciphers 'meaning'. 'Matter is "pregnant" with its form, which is to say that in the final analysis every perception takes place within a certain horizon and ultimately in the "world"'([4.21], 12). Perception, for Merleau-Ponty, is not a conscious activity of the mind: perception is the mode of existence of the body-subject at a preconscious level, the dialogue between the body-subject and its world at a level that is presupposed by consciousness. At the same time, 'the perceived world is the always presupposed foundation of all rationality, all value and all existence' ([4.21], 13).

In *The Structure of Behavior,* his first published book, Merleau-Ponty considers this theme of the relations between perceiving persons and the world in which they live and perceive through an examination of certain physiological and psychological theories, principally behaviourism and *Gestalt* psychology. He exposes the inadequacy of behaviourism by showing that we cannot explain the facts of perceptual life by conceptualizing the relation between the perceiving organism and its milieu in terms of an automatic machine whose pre-established mechanisms are brought to life by reaction to external stimuli. 'The true stimulus is not the one defined by physics and chemistry; the reaction is not this or that particular series of movements; and the connection between the two is not the simple coincidence of two successive events' ([4.20], 99). Behaviourism, in other words, is false as a model of perceptual behaviour.

So is idealism. It is not a question of superimposing a pure, thinking consciousness on a brute, thinglike body. Within the realms of physics or mechanics, a body can legitimately be seen as a thing among things. But the scientific point of view is itself an abstraction. 'In the conditions of life…the organism is less sensitive to certain isolated physical and chemical agents than to the constellation which they form and to the whole situation which they define' ([4.21], 4). Furthermore, the behaving organism displays a kind of 'prospective activity', as if it were oriented towards the meaning of certain elemen-tary situations, 'as if it entertained familiar relations with them, as if there were "an *a, priori* of the organism", privileged conducts and laws of internal equilibrium which predisposed the organism to certain relations with its milieu' ([4.21], 4). Higher-order behaviours bring out new forms or shapes of the milieu, in correlation with the

meaning-conferring activity of the behaving subject. Perceptual behaviour emerges from these relations to a situation and to an environment which are not the working of a pure, knowing subject.

In the *Phenomenology of Perception,* his major published work, Merleau-Ponty takes for granted the emergence of perceptual behaviour and installs himself in it 'in order to pursue the analysis of this exceptional relation between the subject and its body and its world'. The book seeks to illustrate how the body is not 'an object in the world, under the purview of a separated spirit…. It is our point of view on the world, the place where the spirit takes on a certain physical and historical situation' ([4.21], 4–5). Although space does not permit any more than a cursory glance at this long and densely textured treatise, it is worth lingering on its Preface, one of the classic texts in the history of phenomenology.

This is Merleau-Ponty's phenomenological manifesto, one that is clearly indebted to the unpublished works of Husserl which he had first inspected in 1939 in Louvain. This is the Husserl who emphasized the *Lebenswelt,* the life-world in which all thinking, perceiving and acting takes place. According to Merleau-Ponty, phenomenology is

> a philosophy which puts essences back into existence, and does not expect to arrive at an understanding of man and the world from any starting point other than that of their 'facticity'…. It is also a philosophy for which the world is always 'already there' before reflection begins—as an unalienable presence; and all its efforts are concentrated upon re-achieving a direct and primitive contact with the world, and endowing that contact with a philosophical status.
>
> ([4.18], vii)

The first feature of this phenomenology is that it is a rejection of science: 'I am not the outcome or the meeting-point of numerous causal agencies which determine my bodily or psychological make-up.' I cannot conceive of myself as 'a mere object of biological, psychological or sociological investigation…. The whole universe of science is built upon the world as directly experienced, and if we want to subject science itself to rigorous scrutiny and arrive at a precise assessment of its meaning and scope, we must begin by reawakening the basic experience of the world of which science is the second-order expression' ([4.18], viii). If the world as understood by phenomenology is 'always already there', it is not the 'objective' world of zoology, social anatomy or inductive psychology, since 'I am the absolute source, my existence does not stem from my antecedents, from my physical and social environment; instead it moves out towards them and sustains them, for I alone bring into being for myself…the tradition which I elect to carry on' ([4.18], ix). To return 'to the things themselves' (an earlier rallying cry of Husserlian phenomenology) is to return to 'the world that precedes knowledge', the world of which science always speaks. In relation to this primordial world, science is an abstract and derivative sign-language, as is geography in relation to the countryside in which we already recognize a forest, a meadow or a river. The purpose of phenomenology is to analyse these perceptual foundations which precede knowledge and upon which our knowledge is built ([4.18], ix).

Also in the Preface to the *Phenomenology of Perception,* Merleau-Ponty offers a

revised version of Husserl's 'phenomenological reduction', a way of looking at the world which enables us to see just how embedded in it we actually are. 'It is because we are through and through compounded of relationships with the world that for us the only way to become aware of the fact is to suspend the resultant activity, to refuse it our complicity.' It is because the certainties of common sense and the 'natural attitude' to things are the presupposed basis of any thought that they are taken for granted and go unnoticed. Only by applying the phenomenological reduction, by suspending for the time being our recognition of them, can we bring them into view. Reflection 'steps back [from the world] to watch the forms of transcendence fly up like sparks from a fire; it slackens the intentional threads which attach us to the world and thus brings them to our notice; it alone is consciousness of the world because it reveals that world as strange and paradoxical'. Not only is the philosopher a perpetual beginner, but 'philosophy consists wholly in the description of its own beginning'. It is in this sense that phenomenology 'belongs to existential philosophy', the philosophy that interrogates Heidegger's 'being-in-the-world' ([4.18], xiii).

In the course of this personal restatement of phenomenological principles, Merleau-Ponty considers the notion of intentionality, at the same time sketching out his own understanding of history. Unlike the Kantian relation to a possible object, phenomenological intentionality assumes that the unified world that is already there is the world that is 'lived' by me. What Husserl calls 'operative intentionality' is the way in which consciousness knows itself to be a project of the world, 'meant for a world which it neither embraces nor possesses, but towards which it is perpetually directed'. Operative intentionality 'produces the natural and antepredicative unity of the world and of our life, being apparent in our desires, our evaluations, and in the landscape we see, more clearly than in objective knowledge, and furnishing the text which our knowledge tries to translate into precise language' ([4.18], xviii).

These are the dimensions of history, the events that are never without meaning. In seeking to understand a doctrine, it must be examined from the point of view of ideology, politics, religion, economics and psychology—all at the same time! 'All these views are true provided that they are not isolated, that we delve deeply into history and reach the unique core of existential meaning which emerges in each perspective. It is true, as Marx says, that history does not walk on its head, but it is also true that it does not think with its feet.' Neither head nor feet are paramount, of course: all aspects of a life are captured in 'the body'. In an obvious reference to Sartre's famous claim that 'we are condemned to freedom', Merleau-Ponty concludes this discussion of intentionality and history with the thought that 'because we are in the world, we are condemned to meaning, and we cannot do or say anything without its acquiring a name in history' ([4.18], xix).

The above discussion leads naturally into a discussion of the individual's relations with other people. To the extent that phenomenology unites extreme subjectivism and extreme objectivism in its notion of rationality, it discloses the way in which 'perspectives blend, perceptions confirm each other, a meaning emerges'. Phenomenological rationality exists neither in an ideal world proper to absolute spirit nor in the real world of scientific investigation and knowledge. The phenomenological world is the sense or meaning *(sens)* revealed where the paths of the individual's various experiences intersect; and also 'where my own and other people's intersect and engage each other like gears'. With this

image of the meshing of gears *(l'engrenage),* Merleau-Ponty seeks to capture both subjectivity and intersubjectivity, 'which find their unity when I either take up my past experiences in those of the present, or other people's in my own' ([4.18], xx).

THE PHENOMENOLOGY OF SPEECH, LANGUAGE AND ART

The *Phenomenology of Perception* largely consists of a series of studies on the role of the body and perception in various aspects of social and cultural experience: speech and language, expression, sexuality, art and literature, time, freedom and history. Space limitations preclude here more than a few cursory glances in this direction. When I perceive in my world cultural artefacts as varied as roads and churches, or implements such as a bell, a spoon or a pipe, 'I feel the close presence of others beneath a veil of anonymity'. The challenge is: how can the word 'I' be put into the plural? When it comes to 'other selves', contact is established through my perception of other bodies. 'It is precisely my body which perceives the body of another, and discovers in that other body a miraculous prolongation of my own intentions, a familiar way of dealing with the world. Henceforth, as the parts of my body together comprise a system, so my body and the other's are one whole, two sides of one and the same phenomenon' ([4.18], 354).

But bodies only establish initial (mostly visual) contacts. The most important cultural phenomenon in the perception of other people as people (as distinct from simply living beings) is language *(le langage)*. In the experience of dialogue, a common ground is constituted between the other person and myself. 'My thought and the thought of the other are interwoven into a single fabric.' Neither my interlocuter nor I invented the language that enables us to communicate: 'our words are inserted into a shared operation of which neither of us is the creator…. Our perspectives merge into each other, and we coexist through a common world' ([4.18], 354). Coexistence does not remove the fact of solitude, but solitude and communication are 'two "moments" of one phenomenon, since in fact other people do exist for me' ([4.18], 359). Indeed, I would not even be in a position to speak of solitude, much less declare others inaccessible to me, if I did not have the experience of other people.

Language, then, is discovered by me in my phenomenal field and used by me for expression and communication with others in that shared antepredicative world. One of the uses to which language is put, of course, is literature; and literature, for Merleau-Ponty, is firmly embedded in the lived world of politics and economics. In a long note on the existential interpretation of historical materialism, tagged on to the end of the chapter of the *Phenomenology of Perception* devoted to 'the body in its sexual being' ([4.18], 171–3), Merleau-Ponty writes that 'the existential conception of history' rejects the idea that our actions are *determined* by socio-economic factors in our situation. It does not, however, deny that our actions are *motivated* by such factors. 'If existence is the permanent act by which man takes up, for his own purposes, and makes his own a certain *de facto* situation, none of his thoughts will be able to be quite detached from the historical context in which he lives, and particularly from his economic situation.'

This applies to the philosopher, to the revolutionary and to the artist. It would be ridiculous, writes Merleau-Ponty, to see Paul Valéry's poetry as simply the product of his

economic circumstances. But it would not be absurd 'to seek, in the social and economic drama, in the world of our *Mitsein,* the motive of this coming to awareness'. The act of the artist (or the philosopher) is a free act, but it is not motiveless. The freedom of the artist is not exercised in a vacuum, completely divorced from the world of shared experience; 'it consists in appropriating a *de facto* situation by endowing it with a figurative meaning beyond its real one'.

Every aspect of our life 'breathes a sexual atmosphere' (as Freud showed), without our ever being able to identify a single content of consciousness that is either 'purely sexual' or without any sexual content whatsoever. In the same way, all our lives are suffused with 'the social and economic drama' which provides each one of us (the artists as well as everyone else) with an inescapable element of the stuff of our existence, which we set about deciphering and reappropriating in our own distinctive way.

> Thus does Valéry transmute into pure poetry a disquiet and solitude of which others would have made nothing. Thought is the life of human relationships as it understands and interprets itself. In this voluntary act of carrying forward, this passing from objective to subjective, it is impossible to say just where historical forces end and ours begin, and strictly speaking the question is meaningless, since there is history only for a subject who lives through it, and there is a subject only in so far as he is historically situated.
>
> ([4.18], 172–3)

We have barely touched on Merleau-Ponty's impressive, but scattered, phenomenology of expression. Most of his more important studies on language, literature, culture and art—which he defined as 'the progressive awareness of our multiple relations with other people and the world' ([4.22], 152)—are gathered in the collections *Sense and Non-Sense* and (especially) *Signs,* which he prefaced with an Introduction (1960) that helps to situate these studies within his evolving philosophical project. *Eye and Mind* ([4.21], 159–90) is his important late essay on painting. The unfinished manuscript abandoned in 1952 and published posthumously as *The Prose of the World* was conceived, in inspiration at least, as a response to Sartre's *What is Literature*? It could be said that the phenomenon of language became, in one way or another, the main focus for all of Merleau-Ponty's subsequent work. In this respect, he is at one with the other great philosophers of the twentieth century, in both the continental and analytic traditions—one thinks of figures such as Heidegger and Wittgenstein, Gadamer, Ricoeur, Austin and Searle. In Merleau-Ponty's case, language is the entry point for a more profound understanding of human interrelations—which, he writes in 1952, 'will be the major topic of my later studies' ([4.21], 9). The meaning of language consists in 'the common intention' of its constituent elements; 'and the spoken phrase is understood only if the hearer, following the "verbal chain", goes beyond each of its links in the direction that they all designate together' ([4.21], 8). In that direction (as we shall see below) lies Being. (For an excellent summary of Merleau-Ponty's views on these topics, see [4.74], 78–86. For a more extended discussion of his theory of existential expression and communication, see [4.82].)

EXISTENTIAL FREEDOM, HISTORY AND POLITICS

In the immediate aftermath of the Liberation, taking stock of what had been learned in the experience of the war and the occupation, Merleau-Ponty declared that in the course of the war 'we have learned history, and we claim that it must not be forgotten' ([4.22], 150). Not surprisingly, his conception of history, and the role of the individual in history, was forged in the crucible of his wartime experience. The final chapter of the *Phenomenology of Perception* (written at this time) is devoted to a dialectical encounter with Sartre's notorious theory of 'absolute freedom' (with its obvious implications for our understanding of history and historical *praxis*), as presented to the world only a year or two earlier in *Being and Nothingness*.

The first three pages of this final chapter outline, roughly, the Sartrean position. However, Merleau-Ponty points out that the problem with Sartre's radical opposition between the determinism of the brute in-itself ('scientism's conception of causality') and the absolute freedom of the conscious for-itself ('divorced from the outside') is that it would appear to rule out the possibility of freedom altogether. If it is true that our freedom is the same in everything we do, if the slave who continues to live in fear is as free as the one who breaks his or her chains (or anyone else, indeed), then there can be no free action, since freedom obviously, as in this example, has nothing to do with actions. Furthermore, 'free action, in order to be discernible, has to stand out against a background of life from which it is entirely, or almost entirely, absent' ([4.18], 437). If freedom is everywhere (since it is simply the mark of human being, or being for-itself), then, says Merleau-Ponty, it is nowhere. The very idea of action, the very idea of choice, disappears, 'for to choose is to choose *something* in which freedom sees, at least for a moment, a symbol of itself. Freedom implies a struggle, freedom must be striven for; freedom must make a decision. If freedom is already achieved without free actions, as it would be in a Sartrean world, then free actions become redundant (ibid.). What is required instead is a theory of freedom that 'allows it something without giving it everything' ([4.22], 77).

Merleau-Ponty works out what this 'something' is by resuming his analysis of *Sinngebung:* that is, interpretation, or, literally, the bestowal of significance on situations. If we accept that there is 'no freedom without a field', and if we reject as non-phenomenological the Kantian idea (which Sartre often seems to adopt) of a consciousness which 'finds in things only what it has put into them', then our understanding of *Sinngebung* must involve the intermeshing of both the conditions of possibility of perception (the body-subject) and the conditions of reality of perception (the world of situations in which I find myself).

To say that a particular rock is unclimbable makes sense only if I entertain the project of climbing it; the attribute 'unclimbable' (like all attributes) can be conferred upon the rock only by 'a human presence'. 'It is therefore freedom which brings into being the obstacle to freedom, so that the latter can be set over against it as its bounds' ([4.18], 439). But given that I have the project to get from A to B, not every rock will appear to me as unclimbable. My freedom does not contrive it that this way there is an obstacle to

my progress and that way there is a way through, but it does arrange it for there to be obstacles and ways through in general. Without my 'human presence' there would be neither obstacles nor ways through. But it is crucially important to distinguish: my freedom 'does not draw the particular outline of the world, but merely lays down its general structures' (ibid.).

The general structures of the world, which dictate that some mountains are climbable while others are not, are to be found not out there, in an in-itself, but within me. Irrespective of my 'express intentions' (for example, my plan to climb those mountains next week), my 'general intentions' evaluate the potentialities of my environment: for example, the fact that they exceed my body's power to take them in its stride. This brings us back to Merleau-Ponty's fundamental insight involving the body-subject's 'insertion in the world': underlying myself as a thinking and deciding subject there is 'as it were a natural self which does not budge from its terrestrial situation' ([4.18], 440). All the 'free' choices in the world will not obviate this fundamental relationship: 'in so far as I have hands, feet, a body, I sustain around me intentions which are not dependent upon my decisions and which affect my surroundings in a way which I do not choose' (ibid.).

To use Merleau-Ponty's terminology (borrowed from the *Gestalt* psychologists), these 'general intentions' are the ever-present 'ground' against which my decisions are 'figures'. This ground is 'general' in the sense that it constitutes a system in which all possible objects are simultaneously included; and also in the sense that it is not simply mine but something I share with 'all psycho-physical subjects organized as I am'. For we are all indeed 'intermingled with things'. While it is true that none of those things constitutes an obstacle unless we ordain it so,

> the self which qualifies them as such is not some acosmic subject…. There is an autochthonous significance of the world which is constituted in the dealings which our incarnate existence has with it, and which provides the ground of every deliberate *Sinngebung*.
>
> ([4.18], 441)

In the same way as the mountain that constitutes an obstacle is 'my obstacle', the pain that makes me 'say what I ought to have kept to myself is 'my pain', and the fatigue that makes me break my journey is 'my fatigue'. According to Sartre, I am always free to transform my being in the world, including my chosen tolerance of pain or fatigue. But Merleau-Ponty draws attention to the fact that this transforming for-itself does not operate as if I had no yesterdays. Rejecting Sartre's famous contention that 'existence precedes essence', he insists that a theory of freedom must recognize 'a sort of sedimentation of our life: an attitude towards the world, when it has received frequent confirmation, acquires a favoured status for us' (ibid.). While it's all very well to claim that the self is always free to change the habits of a lifetime, Merleau-Ponty insists that 'having built our life upon an inferiority complex which has been operative for twenty years, it is *not probable* that we shall change' ([4.18], 442).

To the objection of the rationalist (such as Sartre) that my freedom to change is either total or non-existent, that just as there are no degrees of possibility there are no degrees of freedom, Merleau-Ponty retorts that 'generality and probability are not fictions, but

phenomena; we must therefore find a phenomenological basis for statistical thought' (ibid.). Statistical thought simply addresses the fact that I have a past which, 'though not a fate' (since my past does not totally determine my future), 'has at least a specific weight and is not a set of events over there, at a distance from me, but the atmosphere of my present'. Drawing once again on the image of *l'engrenage,* Merleau-Ponty concludes that 'our freedom does not destroy our situation, but gears itself to it' (ibid.). (Cf. Merleau-Ponty's application of the Freudian concepts of repression and fixation to 'personal time' and 'the ambiguity of being in the world', [4.18], 83–5. For a discussion, see [4.49].)

The past, therefore, does not determine my future, but neither is my history irrelevant. History—my own personal history and the history of the wider community within which I live—provides the context within which I make my choices. And Merleau-Ponty illustrates this conception of conditioned freedom by reference to the question of the development of class consciousness and the decision to be a revolutionary. He again seeks to discover a third way between the two traditional abstractions. Objective (Marxist) thought derives class consciousness from the objective material conditions; and idealist reflection reduces the condition of being a proletarian to the individual's awareness of it. But 'in each case we are in the realm of abstraction, because we remain torn between the *in itself* and the *for itself*. What is necessary is a return to the phenomena, 'to the things themselves': instead of abstractions, we must apply 'a genuinely existential method'.

A person's objective position in the production process will never in itself issue in class consciousness; rather, it is the decision of individuals to become revolutionaries that prompts them to see themselves as proletarians. 'What makes me a proletarian is not the economic system or society considered as systems of impersonal forces, but these institutions as I carry them within me and experience them; nor is it an intellectual operation devoid of motive, but my way of being in the world within this institutional framework' ([4.18], 443). The transition from individual self-description to class solidarity with others takes place through a growing awareness that 'all share a common lot' ([4.18], 444). 'Social space begins to acquire a magnetic field, and a region of the exploited is seen to appear' ([4.18], 445). Neither the status quo nor the free revolutionary action that might overturn it is an abstraction; 'they are lived through in ambiguity' (ibid.). To be a member of a social class is not only to be intellectually aware of the fact; it is to identify oneself with a group 'through an implicit or existentialist project which merges into our way of patterning the world and coexisting with other people' ([4.18], 447).

This is not to say that one cannot at any moment amend one's existential project. What one cannot do is pretend to be a nothingness *(néant)* and choose oneself out of nothing. 'My actual freedom is not on the hither side of my being, but before me, in things.' It is misleading to say (as Sartre does) that I continually choose myself; and that to choose not to choose is still to choose. 'Not to refuse is not the same thing as to choose' ([4.18], 452). In the lived world, there is never determinism and never absolute choice; I am never either a 'being' or a 'nothingness'. We are involved in the world and with others 'in an inextricable tangle' ([4.18], 454). This significant life, this certain significance of nature and history that makes me what I am, far from cutting me off from the rest of the

world, makes it possible for me to remain in communication with the rest of the world. Philosophy, which teaches us to see things in the world and in history in all their clarity and in all their ambiguity, best performs its role by ceasing to be (intellectualizing) philosophy. In the words of Saint-Exupéry with which Merleau-Ponty closes the *Phenomenology of Perception:* 'Man is but a network of relationships, and these alone matter to him' ([4.18], 456).

(Merleau-Ponty published a wide range of articles on the role of the individual in history and politics, varieties of Marxism, the role of the Communist Party, and the Soviet Union. Most of these were collected in *Sense and Non-Sense, Signs, Humanism and Terror* (a polemical riposte to Arthur Koestler's *Darkness at Noon*), and *Adventures of the Dialectic*. For the best extended discussions of Merleau-Ponty's philosophical politics, see 4.119 and 4.130.)

THE HYPERDIALECTIC OF THE FLESH

In the prospectus of his future work written in 1952, Merleau-Ponty writes: 'my first two works sought to restore the world of perception.' As we have seen, all aspects of our life are underpinned by antepredicative perception, the specifically human mode of inherence in the world in which we all live. Looking to the future, he goes on: 'my works in preparation aim to show how communication with others, and thought, take up and go beyond the realm of perception which initiated us to the truth' ([4.21], 3). He wishes to go beyond the 'bad ambiguity' of his works already published and articulate a 'good ambiguity', 'a spontaneity which gathers together the plurality of monads, the past and the present, nature and culture into a single whole. To establish this wonder would be metaphysics itself ([4.21], 11). He himself saw the enormous philosophical achievement represented by the works we have been examining thus far in this chapter as furnishing only the groundwork for the ontology that was to be the work of his mature years. His elaboration of this ontology of 'the flesh' is contained in a number of works published posthumously, but especially in the incomplete manuscript entitled *The Visible and the Invisible*.

It is impossible to exaggerate just how ambitious Merleau-Ponty's mature project really is. He proposed to go beyond (or below, for he frequently returns to the metaphor of archaeology) the traditional philosophical categories of realism and idealism, subject and object, consciousness and world, in-itself and for-itself, being and nothingness, the knower and the known, and discover in that scarcely penetrable region what he called 'the flesh of the world', the primordial stuff in which we all inhere and which is the ultimate ground of all human experience. It is also impossible to give any more than a flavour of this dense and enigmatic text, available to us in the form of 160 pages of an apparently finished methodological introduction, followed by a remarkable chapter entitled 'The intertwining—the chiasm' *(L'entrelacs—le chiasme)* and about 110 pages of working notes. I shall do no more here than draw attention to a few key terms introduced by Merleau-Ponty in these pages: the notion of 'hyperdialectic', and the related concepts of 'the flesh' and 'the chiasm'.

When Merleau-Ponty addresses the theory of dialectic in *The Visible and the Invisible,*

he has in his sights the dialectic of Sartre's *Being and Nothingness*. Sartre's dialectic is a 'bad dialectic'. It is a fixed opposition, presented in terms of theses, where reflection imposes an external law and framework upon the content of experience.

> It is with this intuition of Being as absolute plenitude and absolute positivity, and with a view of nothingness purified of all the being we mix into it, that Sartre expects to account for our primordial access to the things…. From the moment that I conceive of myself as negativity and the world as positivity, there is no longer any interaction…. We are and remain strictly opposed.
>
> ([4.24], 52)

The only 'good dialectic', on the other hand, is what he calls 'the hyperdialectic'. A good dialectic is a 'dialectic without synthesis' which must be constantly aware that every thesis is but an idealization, an abstraction from the lived world of experience. 'What we call hyperdialectic is a thought that…is capable of reaching truth because it envisages without restriction the plurality of the relationships and what has been called ambiguity' ([4.24], 94). What Merleau-Ponty is working towards is 'a dialectical definition of being that can be neither the being for itself nor the being in itself…that must rediscover the being that lies before the cleavage operated by reflection, about it, on its horizon, not outside of us and not in us, but there where the two movements cross, there where "there is" something' ([4.24], 95).

Where the two movements cross, of course, is the body. The body is simultaneously part of the world of things and the thing that sees and feels things. The body (which is itself visible) can see things not because they are objects of consciousness, at a distance from it, but precisely because those things are the environment in which the seeing body exists. These two aspects of the body (seen and seer, visible and invisible) are inseparably intertwined: 'the experience of my body and the experience of the other are themselves the two sides of one same being' ([4.24], 225). This intertwining at the most fundamental and primordial level, this anonymous generality of the visible and myself, is what Merleau-Ponty calls 'the flesh' *(la chair)*.

'There is no name in traditional philosophy to designate it' ([4.24], 139). The flesh is not matter and it is not mind. It is not substance. In a manner that recalls Heidegger, Merleau-Ponty goes back to the pre-Socratic thinkers to try to express what he means:

> to designate it, we should need the old term 'element', in the sense it was used to speak of water, air, earth, and fire, that is, in the sense of a *general thing,* midway between the spatio-temporal individual and the idea, a sort of incarnate principle that brings a style of being wherever there is a fragment of being. The flesh is in this sense an 'element' of Being.
>
> (ibid.)

To underline the oneness of this primordial element of Being, Merleau-Ponty names it the 'flesh of the world': 'My body is made of the same flesh as the world,…this flesh of my body is shared by the world, the world *reflects* it, encroaches upon it and it encroaches upon the world,…they are in a relation of transgression or of overlapping' ([4.24], 248).

Merleau-Ponty's overriding concern, as it has been throughout his philosophical career, is to offer a phenomenological description of reality that gets beneath the spurious distinction between extension and thought, between the visible and the invisible. He is not suggesting an identity of thought and extension; the key image is that 'they are the obverse and the reverse of one another' ([4.24], 152). But we are all part of the same 'flesh of the world'. We situate ourselves in ourselves *and* in the things, in ourselves *and* in the other, 'at the point where, by a sort of *chiasm,* we become the others and we become world' ([4.24], 160). The word 'chiasm' *(le chiasme)* recalls the intersection of lines in the manner of the Greek letter *chi (x),* emphasizing the inextricable interlocking of the various aspects of Being, of the perceived and the perceiver, of the visible and the invisible.

One final theme must be mentioned in this brief examination of *The Visible and the Invisible* and that is the important strategic role of language. 'Language is a life, is our life and the life of the things' ([4.24], 125). Parallel to the reverse/obverse relation of the visible and the invisible, language is always considered by Merleau-Ponty against the background of silence: 'language lives only from silence; everything we cast to the others has germinated in this great mute land which we never leave' ([4.24], 126). Because they have experienced within themselves 'the birth of speech *[la parole]* as bubbling up at the bottom of [their] mute experience', no one knows better than philosophers 'that what is lived is lived-spoken *(vécu-parlé)*'.

Language is 'the most valuable witness to Being' (ibid.). Furthermore, language is a witness to Being that does not disrupt the unity of Being, since 'the vision itself, the thought itself, are, as has been said [by Lacan], "structured as a language", are *articulation* before the letter, apparition of something where there was nothing or something else' (ibid.). The speaking word *(la parole parlante),* which brings to the surface all the deep-rooted relations of the lived experience wherein it takes form, the language of life and of action, and also the language of literature and of poetry, is the very theme of philosophy. Of course, philosophy itself is 'that language that can be known only from within, through its exercise, is open upon the things, called forth by the voices of silence, and continues an effort of articulation which is the Being of every being' (ibid.).

CONCLUDING REMARKS

As we come to the close of this brief survey of Merleau-Ponty's *œuvre,* we must take stock. In my view, Merleau-Ponty is one of the great figures of twentieth-century philosophy, a pivotal figure in mid-century: drawing deeply on and creatively reappropriating earlier masters such as Saussure, Husserl and Heidegger, while his formidable presence is evident (albeit indirectly) in the structuralist, poststructuralist and deconstructionist thinkers in the generation that came immediately behind him.

Merleau-Ponty himself always loudly proclaimed his allegiance to Husserl, especially the Husserl of the *Crisis* and the theme of the life-world. Now, Merleau-Ponty's phenomenology was undoubtedly originally inspired by Husserl. And Husserl (as uniquely and creatively interpreted by Merleau-Ponty) remained a living presence

throughout his work. But it is arguable that there is more Heidegger than Husserl in Merleau-Ponty's philosophy. First, there is the centrality of time: for Merleau-Ponty as for Heidegger, human existence is essentially temporal existence. Second, there is the privileging of language in both cases, as was illustrated in the last section. In the famous saying in *The Letter on Humanism,* Heidegger proclaims that 'language is the house of Being' ('die Sprache ist das Haus des Seins'). In *The Visible and the Invisible,* Merleau-Ponty writes that language is 'the most valuable witness to Being' ([4.24], 126). Third, there is Merleau-Ponty's intention—like Heidegger—to offer a comprehensive description of Being. It has to be said, however, that while Heidegger's Being *(Sein)* is ontologically distinct from beings *(Seiendes),* Merleau-Ponty's Being is inclusive of both *Sein* and *Seiendes*.

Some of Merleau-Ponty's recurring themes also prefigure subsequent dominant trends in continental philosophy. It is not incidental that his first book was entitled *The Structure of Behavior*. He carried out a detailed study of both the *Gestalt* psychologists and Saussure's structural linguistics and lectured on Saussure in 1949. To the last book he published he gave the title *Signs*. Merleau-Ponty was clearly at the centre of the emerging philosophical schools known as structuralism and semiotics. His continual and deepening polemic against Sartre's privileging of the choosing subject reflected the growing decentring of the subject in his own work, a theme which in turn becomes central to the later deconstructionist approach to philosophy. (For an interesting discussion of Merleau-Ponty's move 'from philosophy to non-philosophy', see [4.103], 123–51).

So what was Merleau-Ponty's main contribution to the continental philosophy of this century? Perhaps more than any other philosopher, Merleau-Ponty was determined to overcome the dualism between mind and matter, between subject and object, which had dominated European philosophy since Descartes. The contemporary representative *par excellence* of the Cartesian tradition was, of course, Merleau-Ponty's friend/ foe Sartre. We have seen above how Merleau-Ponty constantly pitched his own philosophical approach against Sartre's radical dualism between the thinking and choosing for-itself and the in-itself that is the object of thought. Merleau-Ponty was always a phenomenologist. His fundamental philosophical impulse was always to describe 'the things themselves'; and he opposed dualism simply because it did not offer an adequate description of the phenomena.

It has been suggested that Merleau-Ponty's late philosophy represents a radical break with his earlier phenomenology of perception. I do not agree with this view. Despite the new terminology he developed in the 1950s, his philosophical work is all of a piece; and his later search for a new fundamental ontology can be seen in germ (and sometimes in more than germ) in the *Phenomenology of Perception,* for example in the chapter on the *cogito*. While it is true that he was concerned in his final years that the basic terminology of the *Phenomenology of Perception* (perceiver and perceived) retained remnants of the old dualism, the fact that he was determined to go further and ground the phenomenology of perception in 'the flesh of the world' in no way implies a rejection of the basic thrust and the achievement (as far as it goes) of the earlier work.

Rather, as he expressed it in a working note of January 1959, Merleau-Ponty's concern was to 'deepen' his first two books within the perspective of an ontology which would finally dissolve the subject/ object polarity. This implies only that those first two books

constitute the indispensable starting point of his philosophical project and not its terminus. His abiding concern was to provide a full description of the world. His new ontology would go beyond his earlier phenomenology and provide the radical new foundations for such a description. He makes it clear in *The Visible and the Invisible* that the basic philosophical stance is one of 'interrogation'. Merleau-Ponty's profound philosophical questions have not yet received an adequate answer.

CHAPTER 5
Philosophies of religion

Marcel, Jaspers, Levinas

William Desmond

Gabriel Marcel (1889–1973), Karl Jaspers (1883–1969) and Emmanuel Levinas (1906–) seem like a mere aggregate of thinkers. Jaspers, a German thinker who coined the phrase *Existenz Philosophie,* was influential in making known Kierkegaard's importance. Marcel was a French dramatist with a love of music who came to philosophy from a background in idealism, against which he struggled. Yet the influence, for instance, of Royce, the first person on whom he wrote, was strong. Bergson, now a too neglected thinker, was always in the background. Marcel's Catholicism was extremely significant, yet he bridled at the label 'Christian Existentialist'. He was a philosopher who happened to be a Catholic. Levinas was instrumental in introducing phenomenology to France. In 1930 he published a book on Husserl's theory of intuition that was to excite Sartre to say: That is the way I want to philosophize! Yet Levinas always thought in tension with this phenomenological heritage, and most especially its transformation in Heidegger's fundamental ontology.

These three thinkers have received mixed attention. Jaspers laboured in Heidegger's shadow, as he himself seemed to recognize. Heidegger and he were once friends and Heidegger alone he recognized as being on a par with him. Still Heidegger's enormous influence has tended to eclipse a proper appreciation of Jaspers' achievement. Jaspers was opposed to Nazism, as Heidegger was not. This did not prevent him from acknowledging Heidegger's stature. Indeed Jaspers was more concerned with Heidegger than Heidegger was with Jaspers. Also Jaspers respected the tradition of philosophy, as well as the achievements of science. He did not set himself in contestation with the millennia to hoist himself to unprecedented originality. This, coupled with his restorative efforts *vis-à-vis* perennial philosophy, meant that no cultformed around his thought. This is not to deny that he was and is deeply admired.

Marcel is an insightful existential thinker, but existentialism has been identified widely with its atheistic brands, especially that of Sartre. Because of Marcel's unashamed refusal to silence his own search for God, there has been a failure to listen properly to him by professional philosophers who too easily become embarrassed with the religious. They fail to listen attentively enough to his sometimes elusive themes—the body, the family, the sense of mystery as eluding all objectifications, meditations on what I would call the intimacy of being.

Marcel is difficult to package, though there are recurrent themes which have been packaged as identifiably Marcellian: being and having, problem and mystery, intersubjectivity and embodiment. His style of philosophizing, out of respect for the

subject matter itself, refuses to be packaged, even systematically stated in any simple survey. Though he sometimes has a diffuse style of writing, in the very peregrinations of his thinking he *hits* on some absolutely essential insights. Thus the intimacy of being is always other to technical thinking, eludes complete systematic ordering, is on the edge of completely transparent conceptualization. Philosophy tends to home in on themes that are manageable in a more neutral, public, generalized language. We need that language, but it must be counteracted and complemented with modes of thinking that learn from art, and indeed that allow themselves to be shaped by a certain music of being.

Levinas was not widely known in English-speaking philosophy until recently. His work presupposes familiarity with phenomenology, both Husserlian and Heideggerian, and also the currents of intellectual debates that have swept France from the 1930s onwards, over which the shadow of Hegel has hovered in various interpretations and appropriations. Levinas himself distinguishes his own more strictly philosophical writings from his religious studies, but there is little doubt that religion and philosophy cannot be finally insulated from each other. Many of the themes of his major work, *Totality and Infinity,* are incomprehensible without the sense of the presence/absence of God. Levinas's stature is now being more widely recognized outside France, partly owing to the impact of deconstruction, and its high priest Derrida, who learned a thing or two from Levinas. The service to Levinas is ambiguous. Levinas has always exhibited a spiritual seriousness that is ill repaid by the postmodern frivolity to which deconstruction is frequently prone.

Each thinker is deserving of an entire study. Each has been prolific, Levinas less so, but Marcel and Jaspers have been voluminous. To bring some manageable order to the matter, I will concentrate on three major themes, and as the matter dictates I will mention related ideas, without dwelling on them in the detail they might deserve in another study. These three themes will be: the nature of philosophy; the question of the other; the question of transcendence or God.

GABRIEL MARCEL

Marcel's understanding of philosophical thought is determined by a reaction to the idealism of the late nineteenth century. He did some early work on Royce and Schelling. Their themes were to influence him throughout his writing. Thus the theme of loyalty in Royce is transformed into an ontology of intersubjectivity with distinctive emphasis on the notion of what Marcel calls creative fidelity. I mention the struggle of Schelling to break free of the logicism of his own early thought and Hegel's idealism. The struggle led to Schelling's positive philosophy that is the progenitor of all existential thought, including that of Kierkegaard. Schelling tried to think evil as radically other to reason. Marcel has later occasion to mention Schelling and Kant on this score, but the point is more generally relevant to the conception of philosophy at issue. Evil as a philosophical perplexity takes idealistic reason to its limit where the philosopher has to think otherwise of what lies on the other side of reason, as idealistically conceived.

The desideratum of philosophy as system was bequeathed through Kant, Fichte, Hegel to the whole subsequent history of idealistic and post-idealistic philosophizing. Marcel

did intend at an early point to couch his thoughts in a systematic form. He discovered he could not bring it off without forcing his thoughts into a form that went against their grain. Eventually he published his *Metaphysical Journal* (1927), breaking ground here not only in terms of content but in terms of a different sense of literary form.

Marcel's commitment to what is other to system is forged in deep tension with the sense that thought ought to have some systematic character, certainly an appropriate order in its development and presentation. His Gifford lectures, published as *The Mystery of Being* (1950), are presented as his most systematic work, but there he disclaims anything like a system. Primarily philosophy is a matter of venture and exploration. System, such as it is, comes *after;* it ought not to dictate to the matter what it should be. Thinking is open to the matter at issue, even when the matter offers insurmountable resistance to the encroachments of our categories. The drift of his thinking is not forced into a form that betrays, so to say, its improvisatory nature. This sense of philosophy shares a lot with Kierkegaard and Nietzsche, though Marcel does not list these as early influences. One thinks too of the plurality of literary forms used by Kierkegaard and Nietzsche, though one could also mention the non-systematic forms developed by Shestov and the later Wittgenstein.

Marcel's philosophy has a phenomenological as well as an existential side. In no sense was he a disciple of Husserl. But his philosophizing is phenomenological in holding that thinking ought to start by an act of attention to what appears to us. As best as possible we allow the matter to make its appearance, according to its own form and requirements. The first act of philosophical intelligence demands a kind of mindful attention to phenomena, appearing, happenings, in all their nuance and surprise. This requirement is continuous with his rejection of idealism. The stress in idealism on purely autonomous thought tempts the philosopher to impose his categories on being as appearing, hence to see there only what thought has itself put there. Kant himself talked about the mind as only seeing in nature what it has itself put there. Kant was no absolute idealist but the equivocities of some of his pronouncements, like the one just cited, led to the more uncompromising, hence more coherent, idealism of his successors.

But the full coherence of idealism is also its undoing in that what is other to thought always gets finally reduced to the construction of a category. Marcel rejects this, for at a critical point the emptiness of the categorial construction makes itself felt. Hence Marcel's desire for phenomenological fidelity entails the reassertion of a realism which asks the thinker to let things take their own shape without interference from the dictating intellect. Marcel does not deny a critical dimension to philosophy. On the contrary, the appearing of things is shot through with ambiguities that have to be interpreted and evaluated. Letting ambiguity come to appearance is part of the phenomenological requirement of philosophy. Mindless surrender to ambiguity is not. The ambiguities of being have to be sifted.

This is especially relevant to the existential side of his thinking. Marcel is an existentialist to the extent that he lays a primary focus on human being and the perplexities that burden it about being and most especially its own being. He used the term 'existential' before it became fashionable through Sartre. As finding itself in the ambiguous middle of things, the human being is in quest of the truth of things and most especially its own truth. It is tempted by possibilities that veil or distort or destroy its own

truth and the truth of things. Hence the existential philosopher is again involved in a quest or journey. Not surprisingly, Marcel lays great emphasis on *homo viator,* man the wayfarer, (the title of one of his books).

We are on the way, to where we do not exactly know, from where we know not, in a middle often clouded with uncertainty and sorrow. Marcel does not have quite the intense concentrated passion of Pascal, but they share a similar sense of the enigma of existential contingency. Nor can we stand outside the middle and survey our way of passage as a whole. The deficiency of systematic idealism is the false imputation that we have such an Archimedean point whence we can construct the system of categories to make all being transparently intelligible. Such a system is false to our participation in being, and not least to the singularity of the journeying philosopher. We need a different kind of thinking, which acknowledges our intimacy with being, even in our sense of metaphysical homelessness. The great struggle of philosophy is to get some reflective distance on our being thus in the middle, a distance that does not distort our intimacy with being in the middle. Thinking must be shown in its genesis and process, with all its falterings and flights, its matured fruits and undelivered suggestions.

Here Marcel makes a distinction between what he calls primary and secondary reflection. Primary reflection shows a tendency to objectify being and the human being. It tries to survey the object from outside, or penetrate it as if it were an alien thing to be mastered or overcome. Such a thinking has one of its major sources in Cartesian dualism where knower and known, mind and nature, self and other are posited as antithetical opposites. It is a mode of thinking that attenuates the thinker's participation in being. This kind of thinking corresponds to treating being as a problem.

Secondary reflection is such that the matter being thought unavoidably encroaches on the one doing the thinking. The thinker cannot escape involvement with the matter that is being thought. A thinking that objectifies and fosters the self-forgetfulness of the thinker will not do. It is not that the thinker now collapses into a mushy subjectivism, softly surrendering to the inarticulate, having given up the stiff precisions of articulate objectivism. Secondary reflection, Marcel says, is a recuperative thinking. Once having lived or been caught up or carried along by a process of living, one struggles to get a thoughtful distance on one's course, all the more to interiorize mindfully its possible significance.

In human existence secondary reflection in some form goes on always, but not necessarily in the accentuated form the existential philosopher cultivates. As Kierkegaard says: life has to be lived forward, but thought backward. Secondary reflection is thus recollective. As such it is not a nostalgic thinking; for to gain a mindful sense of one's present and past may open a truer orientation to what is to come. Secondary reflection is bound up with the possibility of hope. Hope is a major theme for Marcel. Indeed one can say that Marcel takes very seriously Kant's question: For what may we hope?

The difference of primary and secondary reflection is relevant to Marcel's treatment of the notions of problem and mystery, and thesein turn influence his critique of the spiritual devastations wrought by the modern hegemony of unrestrained technicism, indeed the idolatry of technique. Like many other thinkers, Marcel recognizes the modern dominance of scientific method and its way of conceiving the world. He does not deny the benefits that come from this way, but is disturbed at the accompanying neglect of

issues that fall outside its purview. Scientific method treats of all questions as problematic matters: difficulties that can be solved by means of techniques of objective experimentation and calculation. The hegemony of this approach can lead to the atrophy of human perplexity before the metaphysical enigmas of existence.

Consider questions of despair and salvation. These become a matter of psychological adaptation as the singular self becomes a case of maladjustment. The promise of our despair is betrayed, not even guessed. With issues like suffering, the pervasiveness of evil and the inevitability of death we deal with mysteries or meta-problematic themes. These are perplexities that involve us and shake us and make us sleepless. We are threatened and challenged and put on trial. They never yield a univocal answer; indeed they cannot properly be formulated as univocal problems. A constitutive openness and ambiguity remains. We have to return to such perplexities again and again. We never conclusively master them.

Marcel does not advocate the abandonment of reason, as if these mysteries were absurdities. They do demand a thoughtfulness not reducible to scientific knowledge, moving the philosopher closer to the poet and the religious. The hegemony of the problem makes us take for granted the existence of things and our own. By contrast, the philosopher for Marcel is stunned into thought by just that fact of existence, astonished at the marvel that things are. That the world is at all is the wonder. This mystery is all around and within us, though to it we are heedless. We look but overlook; we hear but have not listened or heard.

The neglect of mystery and the hegemony of problem leads to a world wherein technique reigns with only sporadically disputed sway. There is an anonymity to technique that is antithetical to the singularity of existing. Technique involves a set of directives that can be used by all; the directives of a technique do not originate with the user but, if we desire success in the outcome, to these directives we must submit. Thus technique can breed a conformism, a certain standardization of the human being, an averaging. Uniqueness and recalcitrant singularity are levelled down.

This is a theme sounded loudly by Kierkegaard and Nietzsche. We have heard it so often that perhaps we are jaded. But weariness with a question does not mean it is solved. Technique shows the calculative mind in action. But there is no technique of human wholeness or integrity; there is no technique of ethical responsibility; there is no technique of honesty and truthfulness. Technicism is in flight from the unexpected and the uncontrollable. The idolatry of technique is really a metaphysical hostility to our vulnerability before the incalculable chance of being. The tyranny of technique drowns the deeper human in a conspiracy of efficiency and a frenzy of industry. It may erect a house but cannot make us a home.

Marcel's philosophizing takes shape at the opposite extreme to this technicism. It is appropriate to mention that this philosophizing owes much to his twin loves: music and drama. He repeatedly resorts to musical images, and was a composer and performer of no little talent. The image of improvisation is important. As applied to philosophy and life it means: the score is not settled before playing; the players are invited to create freely. This is not incidental to the pervasive post-Hegelian concern with the limits of systematic philosophy. Schopenhauer and Nietzsche are the major figures in the nineteenth century who believed that music was the metaphysical art. There are others in the twentieth

century, Adorno most notably, who give some privilege to music. Philosophy, particularly in its logicist forms, can run roughshod over the subtleties, intimacies of being. Music may sing these, as it were, in a manner that forces philosophy to raise the question of the unsayable—the unsayable that yet is sung and so somehow said.

If music as metaphysically significant raises questions about the limits of philosophy, Marcel has no desire to yield to a dark romanticism. Nor does he thematically focus on the metaphysics of music, but uses musical images and metaphors again and again to illustrate some of his more elusive ideas. One has to conclude that there is an implicit community of meaning between his thought and music. Again consider the improvisatory style of some of his philosophizing: a theme is stated, developed, dropped; then resumed, restated; there come to be echoes back and forth; nor does Marcel offer any simple resolution, though there are moments of revelation. Does his thought then sing? Does his philosophy approach the condition of music? The analytical philosopher will squirm. But there is a rigour and discipline in this thinking that the analytical philosopher hardly suspects; there is a rigour and discipline in music too. Even Rudolp Carnap, one of the avatars of analytical philosophy, sensed a connection between metaphysics and music, though not surprisingly his judgment was topsy-turvy: metaphysics is just poor music.

The influence of drama is related to Marcel's preoccupation with the question of *the other*. Marcel was himself a successful playwright, with a lifelong interest in the theatre. Drama presents the concrete dilemmas of humans in their otherness and estrangements and solidarities. It imaginatively enacts the resistance and reciprocity of the self and the other. It returns us to a point of emergent significance that is prior to abstract thought. Marcel said that he had interest not in the solitary 'I am' but in the concrete 'We are'. To exist is to be shaped in this solidarity of selves. Drama, of course, is enacted in and through language where again we face the other. Seemingly inconspicuous words may offer the revelation of the significant world of the other, its wounds, its conceit, its hospitality. Words are pregnant with more than can be rendered in the languages of function. Philosophy, like drama, should awaken vigilance for this 'more'.

One senses sometimes that his own plays were more important to Marcel than his philosophy. His preoccupations emerged in pristine form in his plays which were not meant as mere illustration of philosophical theories. What drama brings to birth, philosophy later may take hold of in reflection. It is as if the dramas were closer to the phenomenological matrix of being, wherein the basic perplexities appeared *in statu nascendi,* in a form more concrete than later conceptualizations could capture.

Some readers may find it tedious for Marcel to quote his own plays. I see it as a strategy of saying. In philosophy we always have a problem of writing about matters closest to the personal, to the intimacy of being. We refuse to be confessional. And yet we have to find strategies of confession, of saying the 'I' with a kind of elemental honesty. In quoting his plays, Marcel can confess without embarrassment. The citation offers not only a theme closer to the phenomenological matrix but also one with a space of possible distance. We do not have to collapse into the theme; it can become the basis for a secondary reflection. There is then a rhetorical complicity between his dramatic and philosophical writing.

In that sense Marcel might be called a plurivocal philosopher. He does not dramatize his philosophizing in the same way as Nietzsche does, who is poet and philosopher in

one; or as Plato does in that great achievement of philosophical writing, the Platonic dialogue. Instead he creates a dialogue between his dramas and his philosophizing, in the philosophizing itself. There are times when he should have let the barrier between them break down, as do Plato and Nietzsche. Perhaps he did not, less for the sake of philosophy as out of respect for his dramatic art which one senses he wanted to preserve from the devitalizing encroachments of abstract philosophical categories.

To break down the barrier need not encourage this devitalization but rather promote a more radical vitalization of philosophical thinking. Admittedly the bureaucratic separation of philosophy and poetry is hard to get beyond. We should get beyond it, on Marcel's own terms, since the functionalizing mind, the bureaucratic mind, is an essentially technical mind. If Marcel too strongly insists on separating the function of drama and philosophy, he will show himself captive to the same narrow mind he denounces otherwise so rightly. He does not, to his credit. Beyond the functionalization of poetry and philosophy and religion, the one thing necessary is honesty nourished by spiritual seriousness. It does not matter whether we label it artistic, philosophic or religious. The dialogue of drama and philosophy points to modes of philosophizing outside system, entirely incomprehensible for an analytical philosopher in thrall to the plain prose of univocal writing.

The theme of the other is connected with Marcel's reflection on the body. His emphasis is on the incarnate person. The flesh is where we are in a primary contact with all otherness, both natural and human. The affirmation of being that arises there articulates a sense of the togetherness of the existing self and the rest of being in its otherness. It is as if the incarnate self is initially an inarticulate 'We are'. Marcel obviously sets himself against any form of Cartesianism and dualism here. There is some affinity with empiricism, stemming from his desire for phenomenological fidelity. The difference is in his interpretation of experience. Empiricist experience is an abstraction from the fullness of original fleshed incarnation. It is as alienated from concrete existence as is Cartesian dualism, from the side of the body in this case, rather than the reflective reason.

The subject is an incarnate self defined intersubjectively. The *inter,* the between of intersubjectivity, does not deny the flesh. The between is stressed by the concretization of spirit in the flesh of the human being. Again the intimacy of our involvement with the other matches the intimacy of our being our own bodies. Marcel is given to criticize the view that we have bodies; the connection of self with flesh is not thus external. Marcel wants to say: we are our body.

Here arises his concern with being and having. Like Marx and many other modern thinkers Marcel was concerned with the question of property, of possession, the nature of having. He denies that a person is what a person has. My property is something over which I have power; I can dispose of it as I please; we cannot so dispose of our own bodies, nor of our fellow human beings without a fundamental violation of our own nature and theirs. It is not that we ought not to take care of things. Marcel is quite aware that our care for things can draw them into the orbit of human attachment in a manner which transforms them, releases in them their promise. Our belongings too can have a more intimate relation to our selfhood. But this more authentic belonging is not simply a relation of dominating power. This applies even more radically to our belonging together

in human community.

The theme of possession of the other has also been a major concern in contemporary European philosophy, especially in the light of different interpretations of Hegel's dialectic of master and slave. Power and domination have been held to define the essence of human relations. This is currently a much debated issue, but Marcel has things to say that have not been surpassed. I mention here Marcel's fascination with Sartre's essentially degraded view of the other where the master/ slave dialectic is concretized as a dialectic of sadist and masochist: either dominate or be dominated is the either/or that runs through all of Sartre. While fascinated with Sartre's view that hell is the other, Marcel is unrelentingly hostile to it. The Sartrean look is the look of the Gorgon that would reduce the other to stone. This look wants to have the other, wants to objectify the other and disarm by pre-emptive violence the suspected threat to the self's freedom.

Sartre's sense of the human body is tied to his understanding of our openness to the other. Sartre's body is the place of negativity, the nothingness that shapes our freedom in its power of refusal, like that of the child that asserts its own difference by repeating its 'No'. If the body incarnates a 'We are' and, in a manner that affirms a solidarity with what is other to self, then we are outside this Sartrean sense of the body, this sense of the other, and this apotheosis of negation as freedom. Against the Sartrean degradation, Marcel recommends the possibility of *disponabilité*. This availability to the other is not threatened by the other, nor concerned to threaten. It signals a reversal of the normal for-self of, say, the Spinozistic *conatus essendi*. It is the promise of an agape, rather than the drive of eros to possess the other.

In opposition to having, our relativity to the other is marked by the gift. The bestowal of a gift is never neutral, never just a transfer of a possession from one to the other. The gift given is the bearer of generosity towards the other and for the other. If human being were exhausted by will to power or *conatus* as self-insistence, giving would be a mere ruse to use the other for the self again. There would be no true giving as a movement of self towards the other but not for the sake of the self, but simply for the other as beloved. Without this giving over of the giver, a gift is not a genuine gift.

Similarly the receiving of the gift is not an indifferent addition to the receiver's inventory of possessions. The communication of self on one side, of course, can be met by refusal on the other. One might distrust the bestower's goodness and turn away, or take and suspect and wait for the appearance of the ulterior motive. The Sartrean self lives this suspicion of the goodness of the other. A thing given is received as a genuine gift in being hospitably welcomed. What touches one in the gift is not the thing or the possession. It is the generous freedom of the other that has made itself available without care for itself. The thanks that then may be voiced has nothing to do with abjectness before an other who has one in his or her debt. Thanks is simple, elemental appreciation of the transcendence of self-insistence by the goodness of the giver.

Marcel offers some important meditations on the family and on paternity in *Homo Viator*. He calls attention to a community of spirit beyond all objectification. There are ontological issues at stake in the shaping of a singular destiny by relation to the family. One might here compare Marcel's respect for paternity and the family to Sartre's contempt of the father in *The Words,* and his juvenile baiting of the bourgeois family. Of course, it is not only Sartre who displays this puerile disdain. Marcel distances himself

from the pervasive attitude in post-romantic modernity that the father is always the tyrannical lord. Levinas's remarks on the family also escape the closed dialectic of master and slave.

Generosity is a condition of being beyond having which testifies to the human power of sacrifice. Sacrifice literally means to make sacred *(sacer facere)*. Here Marcel's concern with generosity relative to the human other shades into his meditations on *the divine other*. For instance, Marcel draws attention to the difference of the martyr and the suicide. Suicides claim that their bodies are their own property and that they can do with them what they will. They claim the freedom to visit the ultimate violence on it. Martyrs look like suicides but are entirely different. They give up their bodies, their lives because neither belong to them. They belong to something higher than themselves and to this their death witnesses. Suicides attest to nothing but their own despair. Martyrs are centred beyond themselves; suicides find a centre in nothing, not even in themselves. The death of a true martyr is living testimony to a higher order of being and worth. Our existence is not our property but a gift of this order. The sacrifice makes sacred; even in this death the martyr gives himself or herself over to this order, gives thanks for its gift.

Marcel as philosopher was not primarily or directly interested in the traditional issues of natural theology. He was concerned with an existential phenomenology of significant occasions in human experience where the sense of the divine breaks through or is offered to us. While his conversion to Catholicism was profoundly influential, he tried to stay on the philosophical side of specifically theological reflections. He was reticent about making full-blown theological statements. He expressed some satisfaction when his reflections spoke to individuals outside Catholicism. His philosophical meditations were suggestive of theological possibilities, without determinately articulating anything even approaching a systematic idea of God.

Marcel's greatest fear, I suspect, and precisely out of religious reverence, was the reduction of God to our concepts. Yet clearly his religious faith provided a matrix that nurtured the characteristic ideas of his philosophical reflection. Reflections on the mystery of suffering and evil, and on the love that seeks to outlive death, take his thought again and again to the borders of religious faith.

He set himself against the traditional proofs of God as objectifying what ought never to be objectified. The very idea of proving God is a misconception, a misconception that might border on a kind of rationalistic sacrilege, if the living God is reduced to a mere toy in a parlour game of conceptual virtuosity. God is never an object, always a Thou that resists reification. Yet Marcel was profoundly disturbed at the godlessness of western modernity. There is in his writings a growing sense of the spiritual waste produced by godless modernity when coupled with the unbridled hubris of a Promethean technicism. He has much in common with Heidegger's later meditations on the absence of the holy in modernity.

Marcel does not fit a common view of existentialism as probing a world from which God has been barred. The atheistic existentialist, reduced to caricature by Sartre, sternly girds his or her loins before this Godforsaken world, and dismisses as a sentimental coward anyone seeking hope and ultimate sense. The stratagem began by being disturbing but ended in a different conformism. Its revolt against the old became its new dogma. To Marcel's credit he was not consoled by this comfort of negation. He willingly

made love, fidelity, hope, transcendence his themes—against the grain of the times.

His suspicion of traditional philosophical concepts of God make him the heir of Pascal and his opting for the God of Abraham, Isaac and Jacob. Not that he accepted a fideistic rejection of reason, a fideism sometimes imputed to Pascal and Kierkegaard, both of whom are more sophisticated as thinkers than can be captured by a dualism of faith/reason. Faith and the spirit of truth are bound together, and reason too is bound by the spirit of truth.

Marcel's reflections on human fidelity take us to the border of religious faith. Thus his discussions of death and immortality have little to do with proving the immortality of the soul. They are meditations on a fidelity between the living and the dead others, a fidelity that transcends the divide between the living and the dead. Nor is the issue of death simply a question of my death; it is much more a matter of the death of the other arousing in the still living the promise of a fidelity beyond death. There is no objective certainty with respect to this fidelity. Nor is there with respect to faith in God. It is always on trial in its sojourn in the world. Fidelity is tied to hope, with the promise of being that cannot now be secured with complete certainty. Fidelity itself may flower into witnessing and testimony. Such existential realities—suffering, fidelity, hope, generosity, love, testimony—are the mysteries in which our sense of the sacred is shaped and on which the philosopher must reflect. The kinship with Kierkegaard is noticeable: the impossibility of objective certainty with respect to faith and fidelity. We are dealing with a trans-objective order, which for Marcel is not merely subjective.

Like Nietzsche he acknowledged the godless condition of modern man. But unlike Nietzsche, he did not see this condition as a gain for human freedom but as the sign of a catastrophic loss or refusal. Marcel admired Nietzsche's honest diagnosis about our godlessness but not his proposed solution in the Overman. Nietzsche offered a version of heroic sacrifice when he says: I love the man who creates beyond himself and thus perishes. But in the end there is no genuine beyond for Nietzsche, since all transcendence dissolves into human self-transcendence. Without transcendence beyond human self-transcendence, our sacrifice witnesses to nothing, except perhaps ourselves. The wasteland still grows.

Promethean humans may steal divine fire, but in absolutizing their own power they betray their community with the power of transcendence beyond them. The aspiration to transcendence is deformed. Its root is the divine ground; out of this ground, it grows; outside of it, the aspiration to transcendence withers. The howl of Nietzsche's Madman was heard by Marcel, but he also heard a different music. With neither Marcel nor Nietzsche had the horror of this howl been cheapened into the postmodern kitsch it has now become, with the chirpy nihilists who blithely claim to be at home in the wasteland.

KARL JASPERS

Karl Jaspers is often identified with German existentialism in that he speaks of one of the tasks of philosophy as the clarification of *Existenz*. He distinguished empirical being *(Dasein)* from *Existenz* which is peculiar to the human being. Some commentators have seen a desire to mark his own thought off from Heidegger's *Dasein,* used in the special

Heideggerian sense to refer to human existence. The relationship between Jaspers and Heidegger would command a study in itself, yet both helped to mediate Kierkegaard's philosophy of existence in the twentieth century. Philosophy of existence emphasizes the singularity of the human being, and often in a manner that stresses the recalcitrance of that singularity to inclusion in any system of concepts. Jaspers shares this view but qualifies it with a different respect for the systematic impulse, and indeed a less closed sense of system than had been dominant since German idealism. The tension of *Existenz* and system, the necessity and the limits of system, the relation of *Existenz* and transcendence at the limit of all systems, constitute some of his major concerns.

Jaspers suffered from ill health since his youth, which he turned to good use by husbanding his strengths for thinking. His sense of philosophy was never that of an academic discipline but that of a noble calling. He was under threat during the Nazi regime, but he re-emerged into public prominence after the war with widespread respect for his ethical integrity. He willingly undertook the public task of raising the question of German guilt, and was always concerned with the spiritual condition of the time, the state of the university, the issues of politics, national and international, especially in a nuclear age, the questions of world religions in an age of mass communication.

Jaspers did not publicly commit himself to philosophy until around the age of 40. His background prior to that was in medicine and psychology. His first published work was *General Psychopathology* (1913), followed by *Psychology of Weltanschauungen* (1919). He was later to say that these were really philosophy all along, though not as overtly so as his subsequent work. His reverence for philosophy made him reluctant to claim its mantle, especially when professional philosophers frequently fell short of the nobility of its calling. His first major work, *Philosophie,* was published in 1931 and established him as a major voice. The point has been made that the publication of Heidegger's *Being and Time* in 1927 stole his existential thunder and dimmed somewhat the lustre of his achievement.

E*xistenz* is Jaspers's counterpart to Heidegger's *Dasein*. For both, only the human being exists in this unique sense: only the human being is questionable to itself. *Existenz* is marked by this relatedness to self that is unique to human being; we are a being for self which is the possibility of free self-determination. Though Kierkegaard's influence marks both Heidegger and Jaspers, in Jaspers we find a strong respect for science grounded in his early training. This respect never wavered. Jaspers departs from the standard picture of existentialism as virulently anti-scientific. He never tires of insisting that science is one of the great works of the human mind. Moreover, any serious contemporary philosophizing worth the name must take due cognizance of its pervasive role in the modern world.

That said, the philosopher's task is not simply to be a methodologist of science. In reflecting on the meaning of science one inevitably inquires as to the precise status of scientific truth and science's role within the full economy of human life. One might even call Jaspers a philosopher of science in this generous sense that up to quite recently was almost unknown in Anglo-American analyses of science: science understood as a human achievement, and hence placed within a larger historical and cultural, indeed spiritual, milieu. To reflect on science is then not to abstract its methodological essence in a pseudo-ahistorical analysis; it is to meditate on the ideal of truth, and in Jaspers's case to

open up a more fundamental sense of truth, which is constitutive of the milieu of scientific truth.

Jaspers's ideal of philosophy here is reminiscent of a certain reading and reconstruction of Kant's project. Many commentators have remarked on his debt to Kant, and Jaspers always acknowledged the depth of this debt. In Anglo-American philosophy Kant has been primarily read through the *Critique of Pure Reason,* interpreted as an anti-metaphysical tract, interspersed with some epistemological insights. Outside of Anglo-American analysis, Kant's more comprehensive ambitions are more willingly and widely recognized. Kant spoke of these ambitions in terms of the architectonic impulse. This means that reflection on science is certainly with a view to plotting the limits of valid cognition within a precisely delimited sphere. But—and this is where the more comprehensive sense of philosophy of science is relevant—to plot that limit is not necessarily to impute a merely negative judgment about other modes of meaning that may be other to science. One thinks the limits of science to know its strength but also its weakness in addressing no less pressing perplexities that transcend science. To assert that there are such perplexities that transcend science is not at all to depreciate science. It is to say that science is not the totality. The philosopher thinks what is other to science in thinking the greatness of science.

A careful reading of the Kantian enterprise will show that the heart of Kant's philosophy is not in the *First Critique* but in the *Second Critique,* and perhaps to an ambiguous extent (which has proved powerfully suggestive to Kant's German successors) in the *Third Critique*. German thinkers have this notable ability to hear voices in Kant's writing that to the outsider seem mere silences. In the scholastic twists and turns of the Kantian architectonic they sense that Kant was a tortured thinker. A tortured perplexity of thought is incessantly at work behind or beneath the scholastic encasing of concepts wherein Kant sheaths his explorations. Jaspers singles out many great thinkers for mention—Plato, Plotinus, Cusa, Spinoza, Hegel—but it is clear that his heart hears something in Kant that he hears nowhere else. Kant is often taken as a destroyer of Transcendence. Jaspers's reverence for Kant, I suspect, is as a thinker who tries to plot a winding way from finitude to Transcendence.

This sense of philosophy with a kind of Kantian architectonic is in tension with the singularity of human being as *Existenz*. Granting too the great power of science, there are questions that still exceed its proper competence. I underline the fact that the emphasis must first fall on *questioning*. We are here not talking about academic textbook puzzles. We are talking about the thinking human being as struck into questioning at the edge of all scientific rationalizing. There can be nothing anonymous or neutral about being struck into such questioning, and this is why the very unique selfhood of the philosopher is at stake in a way that is never quite the case in science. The stakes of perplexity are different in philosophy, for the mode of questioning that erupts is not one that can be completely objectified.

In scientific questioning the point is to detach oneself from oneself in the idiosyncrasy of selfhood, and to pose as univocal and determinate a question as possible. The singular I of *Existenz* becomes the anonymous one of univocal mind, consciousness in general. One represents univocal mind, anonymously the same for every rational consciousness, in search of a univocal answer to a univocal curiosity. This is related to Marcel's notion

of the problem. But in philosophy a transformation of selfhood is called for which is energized in a new mode of perplexity which cannot be terminated by information about this object or that object. This perplexity is not a univocal curiosity about this thing or that thing. It is a kind of indeterminate wondering that may extend to the whole of what is, and indeed to the possibility of nothing. The 'objects' of philosophical perplexity are not univocal, determinate objectifiable themes. Nor can the 'results' of philosophical thinking be treated thus, be packaged thus. To do this would be to distort the true energy of living philosophical thinking. This indeterminate perplexity is the very self-transcending energy of human thinking. It was the ceaselessness of this that tortured Kant, even when he thought he had finally laid it to rest in the system and its categories.

I am putting the matter in terms Jaspers does not use but that do not betray his intent. Thus this perplexity is called forth when philosophy deals with what Jaspers calls 'boundary situations' *(Grenzsituationen)*. Questions at the boundary are not just questions about the limits of science, though they are that too. They are questions on the limit, on the edge, *simpliciter*. The most obvious boundary situation is death. There is no answer to the meaning of death, because there is no determinate univocal concept that would put this event within an objective rational whole. Rather this event puts all objective rational wholes into question, and yet the genuine philosopher has to continue to think despite the severe strain put on the ideal of rational completeness. These are the boundary situations Jaspers considers in *Philosophie:* that I must die, that I cannot live without conflict and suffering, that I cannot escape guilt.

Boundary situations are not unrelated to Marcel's notion of the meta-problematic or mystery. They burst out of the system of scientific rationality. Yet philosophy does not end at this bursting. A more authentic philosophizing can then begin. Put in terms of Kant: Kant was obsessed with the desire to make metaphysics into a secure science, and to put behind him all the 'random gropings' of the past. Did Kant secure metaphysics as a science? The answer must be no. It will always be no. Metaphysics is not exhausted by the rationalistic scholasticism of the Wolffian school. Jaspers is critical of metaphysics in a vein reminiscent of Kant's attack on rationalistic science of being. But metaphysical thinking feeds on the indeterminate perplexity that takes us to the boundary and that is more radically energized in encounter with the boundary. There is a sense in which metaphysics really only begins at the limits of science. Despite his Kantian critique of 'metaphysics', I think Jaspers also hears this in Kant: the old rationalistic metaphysics may perhaps be put in its place; but at the limit, the old and ever fresh wonder is recalled into new life. A different kind of thinking has to take place at the boundary. This thinking Jaspers performs under the rubric of what he calls 'periechontology' as distinct from the old 'ontology'.

Consider here Jaspers's claim that truth cannot be reduced to correctness. Scientific truth does operate with some notion of correctness, Jaspers implies. Putting aside the complex disagreements in current philosophy of science, the ideal of correctness is based upon the presupposition that the ideal of determinate intelligibility is fundamental. A scientific proposition or theory or hypothesis is correct if it somehow 'corresponds' to the determinate state of affairs that it purports to report. The scientific proposition or theory or hypothesis must be stated with as much determinate precision as possible. The limit of this precision would be a mathematical univocity, a completely determinate formulation

of a matter without any shade of equivocity or ambiguity or indefiniteness. Moreover, the reality thus propositionally determined is itself taken to be a more or less determinate manifestation of being. To be scientifically objective is thus to epitomize an objective mode of thinking relative to a reality that is objectified in just that sense of being appropriated as completely determinate. Scientific correctness objectively dispels the ambiguities of being. There is no objective *mathesis* of ambiguity, only a *mathesis* that dissolves ambiguity.

Within its sphere this is to the point, as Jaspers acknowledges. But philosophical thinking is already outside this sphere as reflecting upon this ideal of truth as correctness and the will to objective knowing inherent in it. Philosophy is thus already a non-objectifying thought. Jaspers pursues the question relative to truth as correctness by suggesting that determinate objects could not appear as determinable and hence as scientifically intelligible did they not appear out of or against a background that is not itself an object. This is the horizon of intelligibility that makes possible the appearance of determinate objects as determinate. The background horizon relative to which scientific truthdeterminately appears is not itself a determinate truth. There is no truth as correctness possible about this horizon. The horizon is truth in a sense that is not determinable or objectifiable.

Again one is hard put to forget Heidegger's analysis of the primordiality of *alētheia* relative to truth as *orthotes* or *adaequatio*. We might say that this indeterminable truth is the non-objective other to the indeterminate perplexity that drives the self-transcending thinking of philosophy. One wonders if in his own way Kant was aware of this finally indeterminable sense of truth. One of his most suggestive phrases in the *Third Critique* was 'purposiveness without purpose', *(Zweckmässigkeit ohne Zweck)*. Kant does not extend the meaning of this phrase beyond the aesthetic, yet it has implications for the very self-transcending orientation of the human being towards truth as beyond every determinate truth. This is truth as the ultimate horizon of the truths of science and the determinate intelligibilities it discloses. There is, of course, a deep equivocity in Kant in tending to restrict truth to what is scientifically validated, and Jaspers shares in this equivocation, even while in practice extending the notion of truth well beyond scientific correctness. Jaspers's name for this horizon of truth is 'the Encompassing' *(Das Umgreifende),* one of the major ideas in his philosophy as a whole.

D*as Umgreifende*—the word carries the suggestion of being englobed by something that cannot be reduced to any definite object within the globe, the circle. Is this a variation of Parmenides' well-rounded truth? Yes. But any implication of a closed totality is something against which Jaspers will fight. The very language seems almost unavoidably to connote the closed circle. But if so, this is not something Jaspers intends. To close the circle would be to determine the indeterminable and so to objectify its non-objectifiable transcendence. Jaspers also claims that there is a plurality of modes of the Encompassing, and hence a Parmenidean monism will never do. This plurality of modes includes: Being in itself that surrounds us—this is further specified in terms of world and Transcendence; the Being that we are, further specified as empirical existence *(Dasein),* consciousness as such and spirit *(Geist);* finally the Encompassing as *Existenz* and reason *(Vernunft)*.

Jaspers's philosophy is here a post-Kantian Kantianism of *finitude* in which the

singularity of *Existenz* is thrust into the ambiguities of the Kantian architectonic. Jaspers's Kantianism appears again in that the ultimate indeterminability of the Encompassing makes it impossible to capture as a totality. Hegelian idealism makes what for Jaspers is the false claim to totality. To claim totality would be to imply a standpoint external to the Encompassing and this is impossible. Every determinate standpoint is relative to a determinate, objectified other, and hence is itself only possible on the basis of its englobement by the Encompassing.

We humans are not the encompassing of Encompassing. Still there is a sense in which for Jaspers we humans *are* the Encompassing; somehow our self-transcending thinking participates in the Encompassing; we are not determinate things but as *Existenz* participants in the truth in this more ultimate sense. We ourselves are a certain horizon of truth in a sense that cannot be reduced to objective correctness. The 'Kantianism' in this again brings us back to a certain finitude of thought, even in the indeterminate self-transcending of thought. The rejection of totality makes Jaspers join hands with Marcel in rejection of the speculative whole of Hegelian idealism. Marcel is very explicit in saying that the concept of totality is completely inappropriate to the idea of the spirit.

Jaspers, in my view, learned more from Hegel than he always explicitly acknowledged. His willingness to acknowledge the debt was spoken more clearly in his later life, but at the time of his earlier writing Hegel was not seen as an interlocutor that one could be respectably associated with, except to try to thrash. Nevertheless, Jaspers is very much a post-Hegelian philosopher in his refusal of totality, something he shares also with Heidegger. We will see in Levinas a divergence of totality and infinity, where the infinite ruptures every totality, beyond recuperation in any higher totality.

Our failure to determine the indeterminability of the Encompassing does not mean a surrender to the merely indefinite. The other thinking at the boundary of objective thought must be complemented by the project of *Existenz* clarification. Jaspers has some very important reflections on what he calls 'foundering' *(Scheitern)* and 'shipwreck' *(Schiffbruch)*. Philosophy too founders, but in its foundering the possibility of breaking through to something other cannot be closed off. I cannot dwell on foundering here, but we can appropriately situate Jaspers relative to two exceptional predecessors he singles out for special mention: Nietzsche and Kierkegaard. These two could be said to live a sense of philosophical foundering that is deeply significant for all subsequent philosophizing.

Jaspers's writing shows a clear awareness that these two figures signal the end of a epoch, the end of modernity. Without exaggeration one can say that, to the extent that he appropriated their significance, Jaspers himself was a postmodern philosopher. I use the phrase with hesitation, since now postmodernism wastes itself with an academic anti-academic frivolity, the hermeneutics of suspicion gone chic, a scholastic scepticism without spiritual substance. A postmodern philosopher in any genuine sense is one who recognizes the spiritual sickness of modernity. Of course, a sick being is not a dead being, and a sick being continues to live, hence it must be in some other respects healthy. Modernity is sick in this ambiguous sense. Kierkegaard and Nietzsche not only diagnosed this sickness, they lived this sickness within themselves. Both were experimental thinkers, both experienced the illness they tried to cure in themselves, the illness of nihilism.

Kierkegaard's Christian cure, Nietzsche's Dionysian *pharmakon,* diverge. Jaspers thinks that philosophy can never be the same after them. They represent the radical rupture with idealistic totality. They stand before our future as exceptional thinkers who have lived through the spiritual sickness of modernity. Both founder for Jaspers. But this living through and foundering is informed by its own spiritual greatness. This greatness makes one reluctant to ally them completely with 'postmodernism', where the desire for spiritual seriousness or greatness seems feeble, if not terminal. Nietzsche and Kierkegaard would shudder at what passes for their current postmodern appropriations. Nietzsche would see the last men mouthing his songs, and sounding cacophonous. Kierkegaard would be dismayed at the aestheticization of his work, as if he did not call us to God—God, God and nothing but God. Let readers ask themselves if my reiteration of the word 'God' has not sent a shudder of uneasy embarrassment up their spines. Understand Nietzsche and Kierkegaard well. They are embarrassing thinkers; they shame us.

They call into question the traditional pretensions of reason. Jaspers is quite clear about this. Do they bring philosophy to an end? Perhaps philosophy of totality, but philosophy: no. Jaspers is himself a thinker of the end of philosophy, but he has a more nuanced historical sense than the fashionable proclaimers of the end of philosophy. There is an historical fairness. He does not totalize the tradition of philosophy in order to denounce it for totalizing thought—a blatant equivocation not avoided by anti-totalizing totalizers like Adorno, Derrida, Heidegger, Nietzsche himself. Though Jaspers is no Hegelian, there is much about him not entirely antipathetic to Hegel. He acknowledges that for a long time he got great sustenance for his own lectures from Hegel. Granting his greatness, eventually the totalizing Hegel became 'grotesque' for him. I mention his relation to Hegel again in that both have a much more generous attitude to the tradition of philosophy than almost all other post-Hegelian philosophers.

Hegel, Jaspers and Heidegger are perhaps the three greatest thinkers of the last 150 years who have tried to embrace, albeit very diversely, the heritage of millennia in their thinking. Jaspers's generosity to the tradition makes him finally distance himself from the exceptionality of Kierkegaard and Nietzsche. Their provocation of reason has to be balanced by the greatness of reason, as seen from a proper appropriation of the great thinkers of the past. Against the modern will to unprecedented originality—infecting Nietzsche and Heidegger—Jaspers wants to reaffirm the idea of *philosophia perennis*.

A major undertaking of Jaspers was to write a universal history of philosophy. This was never completed. Jaspers was interested not in a history of ideas but in a dialogue with the great thinkers by a genuine philosopher. The truth persists across time, though mediated through time. Nor is this truth identifiable with Heidegger's historicity of being, since Jaspers is not unwilling to invoke eternity, granting, of course, all the cautions and qualifications necessary in any such invocation. The tradition of philosophy is the privileged conversation of great thinkers. He includes himself in that conversation. Across the centuries a great thinker still calls to other thinkers. We later thinkers have to resurrect the greatness of the past thinker, not merely debunk them in the interests of spuriously elevating ourselves into a position of false originality. It is the spiritual truth of philosophical honesty that the great thinkers share. Each concretizes the self-surpassing transcendence of thinking, a personification of the extremity of honest perplexity before

ultimacy.

Jaspers has not been as fashionable as Nietzsche and Heidegger precisely because of the generosity of his respect for tradition. In modernity we have been so infatuated with futurity that we have shortchanged the spiritual greatness of the past. In the future it will be great, it will be new, it will be unprecedented. A rhetoric of originality masks a lot of intellectual conceit. Nietzsche and Heidegger were not immune from thus puffing themselves up. As if a philosopher must strut and preen and crow: How different I am, how new! Cockcrow: and no, not dawn, as Nietzsche said; but flourish, flourish of the postmodern cock.

Jaspers addresses the theme of *the other,* especially in that philosophy for him is inseparable from communication. The dialogue with the tradition is one instance of communication. Communicative reason opens beyond monadic thinking at both ends: towards the past, towards the future. Nor did Jaspers deny the responsibility of the communicative reason of philosophy to shape the spiritual present. Again the other has to be accorded a different place in thought from that allowed for in idealistic totality. Reason in *Existenz* is always marked by a boundless will to communication. One sees some harbingers of Habermas. The communicative relation to the other is constitutive of the activity of reason. Indeed *Existenz* is not itself at all apart from the relation of the self to the other. The demand of communication with the other must be met for *Existenz* to be itself. Likewise we must be awakened to ourselves as *Existenz* if we are to do justice to the demand of communication.

Jaspers confessed to loneliness and incapacity to communicate inhis youth. This was exacerbated by the isolating effects of his illness. Just as *Existenz* cannot be objectified, so our relatedness to the other can never be reduced to an objective relation such as might hold between things. Jaspers' primary emphasis is on the mutual reciprocity of communication between humans. He is a severe critic of the substitution in modernity of mass society for genuine community. The flattening of human beings into averageness, and hence the impoverishment of singularity, diminish, if not deform, what is essential to real community. In the singularity of *Existenz* there is always an opening to what is other than closed subjectivity.

As with Kierkegaard and Marcel, Jaspers offers a critique of the functionalization of man and the massification of societies. The sacrifice of singularity as *Existenz* is the defect of totalitarianism. But this defect also marks the competitive individualism of capitalism, for here singularity is merely atomized, and between atoms there is no deep bond of community. He does not display Nietzsche's elitist disdain for the many. He was deeply and ineradicably influenced by Weber. In many respects he also shares the sense of community at work in Kierkegaard's neglected social critique: each of us is an absolute singularity; this singularity is preserved in community, but genuine community is ultimately a community of spirit under God. The will of *Existenz* to communicate with the other stands under Transcendence as the absolute other.

Nor does Jaspers deny conflict in a mushy communitarianism. As already indicated, guilt and conflict are discussed as boundary situations in *Philosophie*. His suffering through Nazism was itself exposure to the violence of evil. He does underscore the possibility of a loving struggle. Love is not devoid of conflict, but the conflict is a creative war, *polemos,* as it were. Communication can be a contestation which is a mutual

challenge to more authentic *Existenz*. His love for his wife, Gertrude, seem to have epitomized for him this creative contestation. This is close to Marcel's creative fidelity, and certainly beyond sadism and masochism, the degraded form of erotic struggle given so much attention by Sartre.

Communication is also central in Jaspers's ideas of reason and truth. Reason is an opening to the universal, but the true universal is not an anonymous generality in which singularity is submerged. So also for Jaspers truth is incomplete if it does not embody itself in a will to total communication. Truth is not closed on itself, timeless and unaffected by historicity. Jaspers even implies that truth actualizes itself in the movement of communication itself. Truth comes to completion in the process of communication.

One senses the shadow of Kant again. One is reminded of the Kantian *progressus,* the infinite task of the regulative ideal. WhenJaspers indicates a call on self-transformation in communication, to my mind he is talking about *truthfulness,* both singular and communal. Obviously this is constituted in the coming to truthfulness by the self and the community. This is a *becoming truthful* which would not be possible in the solitude of the self-communing thought, self-thinking thought. What about a sense of truth that is not constituted by what comes to be in a process of communication, but that makes possible that process of coming to be of social truthfulness? This sense of truth makes possible the constitution of truthfulness but is not itself constituted by truthfulness. This is truth that a process of communication unfolds or reveals, rather than creates or constitutes.

Residues of the constitutive language of Kantian idealism are here evident in Jaspers. The otherness of truth as for itself is compromised by this constitutive language. Jaspers does not want to deny this otherness but his submission to Kantian ways of thinking conditions a certain emphasis in his efforts to speak of Transcendence. This is applicable with respect to metaphysical transcendence, but also with respect to the possibility of divine revelation. The movement of our transcending, even in the communication of truthfulness, mingles with Transcendence as communicating with us out of its own integral otherness, such that we do not really know if there is this other otherness. What we do, our becoming truthful, seems hard to distinguish from what is done to us, our patience to truth. Does what is done to us collapse into what we do? How then are we to avoid a wrong appropriation of the other?

There is a principle of tolerance in Jaspers's sense of communicative reason. He knows that *vis-à-vis Existenz* we cannot just say there is one univocal truth. The truth is refracted singularly in the specific truthfulness of every singular *Existenz*. Reason must be honestly vigilant to the particularities of just that singular refraction. Communication is this vigilance, and this vigilance is respect for the other as other. I use the term 'refraction', which is not the language of constitutive idealism. And even though there is a quasi-constitutive language in Jaspers, his language of foundering must be seen to plot the limit of this, and indirectly to open a moment of radical receptivity in which we do not communicate but in which the other is communicating with us. Jaspers does not explicitly address the question of symmetrical and asymmetrical relativity in a manner that Levinas does.

Throughout I have referred to Transcendence. Here we approach the question of God. Transcendence for Jaspers is the ground of human *Existenz* and freedom. Jaspers treats of transcendence in volume III of *Philosophie* under the heading *Metaphysics*. The heading

is not insignificant in the light of his critique of ontology from the standpoint of periechontology. The sense of metaphysical transcendence returns,proves unavoidable, even when all the Kantian strictures about metaphysics have been taken to heart. Transcendence is the absolute other. Again the Kantian modulation for Jaspers is that Transcendence is not to be known cognitively but to be reached existentially. There is no positive knowledge of Transcendence. Moreover, Transcendence grants itself gratuitously. Of course, if this is true the autonomy of reason is breached, and every trace of idealism, even Kantian idealism, will have to been reinspected.

Jaspers speaks of Transcendence as the absolute Encompassing, the Encompassing of all the encompassings. Transcendence is not the world, nor is it empty possibility, though Jaspers says that it shows itself only to *Existenz*. Transcendence is the absolute other in which *Existenz* is grounded. Wherever *Existenz* is authentically existing, it is not completely through itself. The human existent does not create itself. Relative to Transcendence I know that I have been given to myself. The more decisively *Existenz* is aware of its freedom the more it is aware of its relation to Transcendence.

I am tempted to think of both Augustine and Kierkegaard. Augustine speaks of being concerned with the soul and God and nothing more. This Augustinian theme is sounded in the correlation of *Existenz* and Transcendence. Moreover, Augustine speaks of God as *intimior intimo meo:* God is more intimate to me than I am to myself. The intimacy of this relation is beyond the world of objectivity; it happens in the deepest interiority of non-objectifiable *Existenz,* selfhood. Truth is subjectivity in Kierkegaard's sense: the truth of Transcendence will never be reduced to a set of general, public concepts. Perhaps this is why Jaspers insists, in Kantian manner, on our relation to Transcendence as non-cognitive. Why not speak of knowing in a different, non-objectifiable sense, a wisdom of idiocy, idiot wisdom of the intimacy of being? Why the obsessive insistence that validated cognition be confined to objective science?

Surely we can expand the notion of cognition without having to give ourselves over to full-blown Hegelian reason? For that matter, without this expansion does not Jaspers's way of talking fall foul of Hegel's critique of Kant's unknowable: If it is unknowable, you can say nothing; you cannot even know that it is unknowable; but you are saying something, then it must not be unknowable. I am enjoining the Hegelian question, not endorsing Hegel's answer to Kant in terms of a dialectical knowing of Transcendence. Hegel's answer sins in the opposite direction of cognitively subordinating Transcendence to immanence. We need a knowing other than Hegelian knowing and a non-knowing other than Kantian agnosticism.

Transcendence is, but is never adequately manifest in appearance. It eludes all thinking if we mean to think it as a determinate object. Itseems easier to name it negatively than to say what it is positively. There is a sense in which we can find no final firm place in trying to say it, whether positively or negatively. Jaspers allows that there are many names for it. We can call it Being, Actuality, Divinity, God. Relative to thinking, he says we can call it Being; relative to life, it can be called Authentic Actuality; as demanding and governing, it can be called Divinity; relative to our encounter with it in our singular personhood, it can be called God.

Again we find a denial of cognitive content in favour of the naming of an existential experience. Self-transformation can occur in encounter with Transcendence; it can

become a source out of which I live and towards which I die. *Amor Dei* can lead to a transformation of how we love and hate the world. Jaspers mentions the magnificent love of the world in Chinese life and the hatred of life in gnostic thought. This latter is finally a nihilism and despair: the godless creation of the world is brought forth by Lucifer. This diabolical creation is counter to God. When the world is God's creation the world is loved and God is loved in God's creation; the promise of human existence is affirmed.

We are always within the world and hence our relation to Transcendence is marked by finitude and foundering. We need the symbol and the cipher to articulate what in the end is beyond all articulation. In his later life Jaspers undertook a major dialogue with religious faith. He himself claimed the standpoint of what he called philosophical faith. Philosophy is often in tension with religion but their quests of ultimacy are akin. Like Hegel, Jaspers insists on the autonomy of philosophy, sometimes to the point of showing traces of a residual Enlightenment hostility to the claims of revealed religion. The same question can be put to both Hegel and Jaspers: To what extent are philosophical ideas rational transformations of religious themes, and hence not autonomous but heteronomous? Is philosophical faith religious faith rationalized?

For Hegel, of course, there is no philosophical faith; philosophy is knowing. Jaspers again stands closer to Kant. His philosophical faith attempts, among other things, to render articulate the 'faith' in favour of which Kant is willing to deny knowledge. This philosophical faith cannot be assimilated to poetry or science or religion. If philosophy is other to religion, it is with respect to critical self-consciousness, not with respect to any Hegelian speculative knowing wherein religion is dialectically *aufgehoben*. This critical self-awareness of limits nurtures a vigilance to the idolatry, whether fideistic or rationalistic, which mistakes the cipher of Transcendence for Transcendence itself. Religion and philosophy are different, not as opposites but as polar approaches to Transcendence. In this polarity they comprise a community of ultimates that are perennially a contestation and a challenge to each other.

EMMANUEL LEVINAS

Emmanuel Levinas was born in Lithuania into an orthodox Jewish family but has spent most of his life in France. His experience of the Second World War was to shape his thought deeply. He has written Talmudic studies, though he claims that his philosophy belongs in another category. Husserl's phenomenology and Heidegger's fundamental ontology influenced his first philosophical studies, influenced in the double sense of supporting his thinking and yet provoking him into struggle against that very support. His mature thought is expressed in *Totality and Infinity* (1961). Subsequently he has published collections of essays leading to *Otherwise than Being or Beyond Essence* (1973). He has also continued to write Talmudic studies of a more strictly religious character. Starting from phenomenology he has moved towards a recovery of metaphysical transcendence and an affirmation of what he calls 'ethics' as first philosophy.

Levinas became better known in English-speaking philosophy in the 1980s, partly mediated through the impact of deconstruction. English-speaking readers will find

Levinas difficult without some sense of the context out of which he writes. Many consider *Totality and Infinity* to be his masterwork. It is a difficult book, for many philosophers as well as non-philosophers. Levinas's thinking is haunted by a whole host of philosophical ghosts. To get some sense of the peculiarities of his philosophizing, relative to his influences and claims, I name some of the ghosts.

There is the Cartesian heritage that seeks cognitive certainty in the foundation of the *cogito,* the 'I think'. Levinas evinces high respect for Descartes, surprising respect in that Descartes is often criticized as the originator of an understanding of mind that locks thought within itself, within its own immanence. Levinas wants to break out of that closed circle of immanence, without denying a certain inner integrity to the subject.

There is the phenomenological tradition, which can be interpreted as an ambiguous continuation of the Cartesian heritage. Levinas's first work was on the theory of intuition in Husserl, and his practice of phenomenology is not without debt to Husserl. He came to question the phenomenological doctrine of the intentionality of consciousness. He points to modes of consciousness where intentionality as a directedness on an object is not the final story. His discussion of enjoyment, for instance, reveals an engagement of consciousness, which cannot be reduced to the intention of an object. The structure of intentionality seems to point to a certain mastery of the object; but if there are modes of the subject beyond intentionality, then objectifying, hence dominating, consciousness does not have the last word.

The presence of Heidegger shadowed Levinas. Heidegger's stature is not denied. Yet the accusation against him is that his Being is an anonymous power that ultimately leads to an account of history as impersonal destiny. The person in its singularity is sacrificed to an ontology of anonymous powers. Heidegger's thought epitomizes ontology as a philosophy of power. Levinas opposes this with a metaphysics of the good wherein a nameless universal Being does not have final sway. Heidegger produces an ontology of the neuter; there is no basis for an ethics.

Levinas speaks against the neutering of being which he tends to identify with the horror and anonymity of what he calls the element. A different view of the elemental is possible, but for Levinas it is the faceless indefinite of the *prima materia* (sometimes wrongly identified with *to apeiron*). His account of the impersonality of the 'There is', as he calls it, reminds one of Sartre's account of being-in-itself, for instance in his phenomenology of the *viscous:* always threatening the integrity of the personal, the self as an integrity of innerness for itself. Levinas rejected the view of human being as derelict, as well as Sartre's alienated vision of man as nothingness. Heideggerian thrownness is counteracted by a phenomenology of enjoyment. Happiness, a prior agreement with being, is a more primordial condition of elemental being.

The question as to why Heidegger was an ardent Nazi is as important to Levinas as it was to Jaspers. Levinas spent time in a prisoner-of-war camp. Nazi philosophy was articulated in terms of a world-historical destiny as expressed in the German people. The others do not finally count; will to power subordinates all ethical concern to the victory of the mighty.

This relates to the influence in French philosophy of Kojève's reading of Hegel through the eyes of the master/slave dialectic in the *Phenomenology*. Hegelianism here becomes reduced to an all-devouring logic of domination and servitude. Sartre takes up a

related interpretation in his infamous identification: hell is the other. Against the violence of the Sartrean look, Levinas sees the defencelessness of the other in the unguarded eyes, a powerlessness that nevertheless commands in the ethical injunction: Thou shall not kill. Levinas rejects the identification of death as the master in Kojève's Heideggerian-Marxist Hegelianism. Contrary to the dialectic of master and slave and its violence, there is a pacific relation to the other that Levinas stresses as underlying the entire economy of labour and dwelling. This relates to the feminine. The grace of the feminine founds the home and the dwelling, out of which the labouring self is articulated, and with this the entire realm of economical, political and historical being. Things are conceived differently at the origins. These origins are not identicalwith the fullness of the ethical relation but they are consistent with it in a way that the dialectic of master and slave is not.

Kojève's Marxist Hegelianism also expresses a philosophy of history which culminates in the modern state as the earthly embodiment of the absolute. The world-historical universal sacrifices the intimate singularity of the self as person to the Moloch of the state. As worldhistorical universals, the state and history are ultimately idolatrous absolutes. Hegelian philosophy, like Heideggerian ontology, is seen by Levinas as an ontology of power which always is tempted to relate to the other by murder. The class struggle historically concretizes the master/slave dialectic. The course of history is war, the goal of history a homogeneous state in which otherness, the dissident other is suppressed in a universal sameness. Though this is abhorrent to Levinas, he is still concerned with labour, property, possession, reminding us of Marcel's concerns with being and having.

Levinas's repeated references to the philosophies of existence are guarded. He shares much with some existentialists, Kierkegaard for instance, in defending the singularity, the ipseity of the human self. Levinas's phenomenological background and its pretence that philosophy must be rigorous, indeed scientific, makes him uneasy with the so-called 'irrationalism' of the existentialists. He distances himself from a philosophy that is merely a protestation against the impersonal reason of the idealists and rationalists. He wants to defend a different sense of reason against individualistic irrationalism. This sense of reason will defend the ethical community of the same and the other. Though Levinas shuns the way of solitary genius, his sense of singularity aligns him with what is best in the philosophies of existence. This is an emphasis on what I called the intimacy of being with respect to Marcel. I find strong echoes of Marcel in some of the themes Levinas dwells on: the family, paternity, filiality, the home, enjoyment.

There is a groundswell of influence from Levinas's Jewishness. It is indicated very explicitly in his admiring reference to Rosenzweig's *The Star of Redemption*. Rosenzweig was initially a Hegelian who had written on Hegel's doctrine of the state. Then he had an astonishing quick conversion—reversion really—to Judaism, out of which *The Star of Redemption* sprung. This book is considered one of the landmarks of modern Jewish thought. Against the lure of Hegelian totality, a metaphysics of creation, as well as an affirmation of singularity as recalcitrant to inclusion in totality, is pursued. Though in *Totality and Infinity* Levinas says he is working in a purely philosophical vein, the distinctiveness of his philosophical voice owes much to the subterranean fermenting of the Jewish heritage.

In contrast to not a few poststructuralist thinkers, Levinas's philosophy has always exhibited a spiritual seriousness that refuses to playact with the matter itself. The return of sacred otherness in Levinas reminds us of Shestov's contrast of Athens and Jerusalem. Shestov is unjustly neglected today but he is a profound, radical thinker of the limits of philosophy in relation to religion as an other, and with a sense of the tradition of speculative metaphysics in some ways more profound than Levinas's.

With Heidegger and many post-structuralists, Levinas tends to totalize the tradition of philosophy. *All* philosophy is said to be only an imperialism of identity or the same. Levinas speaks of philosophy as allergic to otherness, an allergy that reaches its culmination in Hegel. This is surely not true of the philosophical tradition as a whole. This fact is revealed by Levinas's retraction: there is some philosophical acknowledgement of the other, as in Plato's doctrine of the Good beyond being.

The strategy is: totalize the tradition as imperialism of the same; suggest a different thinking of the other that is without precedent; then smuggle back ideas that in some form are found in the tradition; finally, acknowledge instances of such ideas in the tradition. Of course, most readers will have forgotten the first step by the time they reach the last. In fact, the total claim made in the first step is now effectively abolished. Why not acknowledge the last step *at the start*? But one cannot if one wants to claim to 'overcome the tradition'. That claim would be dissolved; suspicion would be cast on the hermeneutics of suspicion. To take the last step first would require a hermeneutics of generosity and perhaps also a different interpretation of the philosophical tradition.

Levinas is not to be confused with Derrida and Heidegger. He is very critical of Heidegger, and his writings evidence a spiritual seriousness that is lacking in Derrida. He mixes suspicion and generosity towards the philosophical tradition in his distinction between what he calls 'ontology' and 'metaphysics'. Ontology marks a philosophy of being that always ends up reducing the other to the same. Ontology is a philosophy of the neuter which cannot do justice to the other, and especially the other as ethical. It is built upon the logic of a movement from the same to the other which is always for the same, and always returning to the same. One is reminded of that strand of the tradition that privileges the movement of thought thinking itself.

By metaphysics Levinas implies a movement of thought that exceeds totality, most especially in the surplus to thought of the idea of infinity and the face-to-face relation of the ethical. Metaphysical thought goes from the same to the other, but not in order to return to the self. This metaphysical movement of mind has always been a philosophical possibility, evidenced in Levinas's own citation of Plato'sGood. Beyond thought thinking itself, thought thinks what is other to thought.

Levinas shows a tendency to identify the assumptions and analyses of Cartesian and transcendental idealism with the essential possibilities of philosophy. Relative to the Cartesian heritage, the *cogito* is privileged as the origin of all rigorously grounded philosophizing. Even Sartre's Cartesianism shows this: the availability of consciousness to itself seems to augur for a mode of philosophizing that is rigorously in possession of its own procedures and contents, for none of its thoughts escape its own immanence, and hence its own certainty and certification. Levinas differently underscores the Cartesian notion of infinitude to find a renewed pathway to the other beyond all mastering thought. Obviously phenomenology offers a more embracing sense of philosophizing than

classical Cartesianism, but their basic presuppositions overlap significantly: immanence to consciousness is fundamental to phenomenology. This is just how the 'phenomenon' of phenomenology is defined: not as the *Sache* as given in itself, but as given to and for consciousness. Nevertheless, starting with many of phenomenology's presuppositions and methodical strategies, Levinas ends up with conclusions that produce the subversion of phenomenological immanence, as well as classical versions of idealism.

Consider an important example: the discussion of representation in *Totality and Infinity*. Long passages are expository of an essentially Husserlian version of representation: representation is representability to consciousness; the immanence of the other is objectified as a representation for the same. This notion of representation has also been attacked by Heidegger, Derrida, Foucault and others. But to take this as *the* analysis of representation is questionable. We are offered analyses of representation and intelligibility which seem to cover the whole field, but do not at all. An account could be given which does not coincide with Husserl's view. Levinas himself goes on to do this, by claiming that there is an uprooted quality to the Husserlian analysis which privileges the theoretical consciousness. Turning to the phenomenon of enjoyment, Levinas finds a more primordial stratum in the genesis of representation that undercuts the analysis of the uprooted version. The 'intentionality' of enjoyment does not privilege self-constituting, or the primacy of the same over the other, as representation allegedly does.

One need not quarrel with this second aim. But Levinas sets up his account as undercutting the philosophical primacy of representation and intelligibility. In fact he is essentially criticizing representation and intelligibility as defined by Husserl's transcendental method. One could give an account of representation in which the privilege of the other over the self is primarily stressed. Instead of representation simply being a commandeering of the other to appear before the self as the self would dictate for itself, it might be an openness to the other in which the truth of the representation is a submission to heterogeneity, a humility before the other which the representation tries to approximate and respect.

Consider: if you ask me to represent you at a meeting, and if I truly want to represent you, I must subordinate my views to you and yours; I as representative must speak for you, the other; I cannot make you, the other, speak for me and yet honestly claim that I am representing you, the other. I am for you, as your representative. Representing is hence being-for-the-other in which the self subordinates the for-self of its own egoism to the truth of the other as it is for the other. This is exactly the opposite of the 'essence' to which Levinas reduces representation. Husserlian phenomenology is one philosophy; it is not philosophy, not the essence of philosophy. Nor is it the touchstone of all comparisons. Indeed its account is not true to the truth of representation as just indicated: a standing for the truth of the other as other.

I dwell on this example, for the standard moves of many poststructuralist thinkers, Derrida included, are already contained in Levinas's account of representation. But all philosophical discourse becomes skewed if Husserlian transcendentalism becomes *the* standard of philosophy against which other views are to be pitted. There is a certain historical, hermeneutical myopia here. When Marcel or Jaspers criticizes idealism, we do not find any tendency to hermeneutical special pleading. They do not totalize philosophy and its traditions. They are more judicious. Yet they too want to get beyond thought

thinking itself to thought thinking what is other to thought.

It is impossible to separate Levinas's philosophy of the other from his sense of infinity and hence the idea of the divine other. Instead of conceiving the world as a fall or an emanation from the One, or a projection of constitutive subjectivity, Levinas's rethinking of the idea of infinity points towards a renewal of the metaphysics of creation. Metaphysics here again means a mode of thinking that is for the other as other, not simply for the same. Creation names the radically originative act by which the singular creature comes into being for itself, and is given its finite being for itself. The Creator absolves His creation from the Creator to let be the other as finite in its given freedom. In that sense, God is the ultimate other that is the giver of all otherness, including the radical otherness that is let be for itself, and in no way coerced into a return that would subordinate a part to an engulfing whole.

The strategic ambiguity here is that Levinas describes the for-self as atheist. On initial reading one might be inclined to think that Levinas espouses atheism. As I understand him, he is saying that the being of finitude as given in creation is atheist; it is a-theist in the most literal sense that it is not-God. God does not create Himself in creating the world, as Hegel and Spinoza might claim. God's creation is the giving of what is radically other to God, radically not-God; and this 'not' is the measure of an incommensurability between the Creator and the created being. This incommensurability is not a merely negative or lamentable disproportion; the 'not' of a-theism is the very space of transcendence in which the freedom of the creature can be enacted and called forth. The atheism of the self is the promise of its possible being-for-itself, and in its being-for-self its possible free relation across an irreducible difference to the divine source itself. Atheist being is then the product of divine generosity; atheism is the precondition of a different relativity between the human and divine which absolves the relata of complicity in relations of domination and violation.

Is there a little disingenuousness here? *Totality and Infinity* was written at a time when atheistic existentialism and Marxism were in their heyday. For well over a century and a half, the spiritual ethos of Europe has been dominated by a *de rigueur* atheism, as is nowhere more evident than in the popularizing of Sartrean existentialism. Levinas is a crafty writer in that he incorporates the truth of atheism within a project that aims to renew the metaphysical affirmation of God as transcendent. In the ambiguous creation, the human being as for-itself is atheist being; but atheist being can know its real otherness to ultimate transcendence and hence out of its atheist being turn towards the other, not as a part returns to its whole, not as an instance subordinates itself to its general, but as a free centre of ethical existence wills to enact the good of the Creator, the good of the creature and neighbour. This ethical affirmation stands sentinel against descent into the anonymous powers of demonic universality, the world-historical universal, whether idolized in Marxist or in Nazi form. In the latter we become agents, instruments of the anonymous universal, and all the more vile when we become judges and executioners of those who will not bow the knee before our murderously exacting idol. This is the malice of atheist being, which does not receive the expression or consideration in *Totality and Infinity* that it should.

Levinas's emphasis on infinity invokes a tale that spans the history of speculative metaphysics, from the pre-Socratics to our own time. Levinas exploits the Cartesian idea

of infinity in a direction that I suspect would have astonished Descartes himself. Pascal was correct and saw right through Descartes when he said: 'I cannot forgive Descartes; in his whole philosophy he would like to do without God; but he could not help allowing him a flick of his fingers to set the world in motion; after that he had no more use for God.' Levinas, who often cites Pascal with approval, seems hardly to suspect the possible godlessness of Cartesianism.

There is also a strange approval of Cartesian doctrines of sensibility, praised because sensibility is held to be essentially other to thought and the concept. Kant is here praised on the same score for insisting on a heterogeneity between sensibility and understanding. One sees the point. The continuity of sensibility and thought, whether in Leibniz or in Hegel, is to be ruptured in defence of a heterogeneity not subsumable under the rational concept. But there is a sense in which such a thing as Cartesian sensibility hardly exists. There is a sensible body in Descartes but it is not the body of flesh; it is not the bodied self; it is the shape of the *res extensa* that in itself is lifeless. How can this lifeless *res extensa* enjoy life, since it is already a dead body? And from where could a Cartesian *res extensa* get a face? The *res extensa* has no face. The Cartesian body is like the featureless wax of Descartes' own example, entirely faceless, except for its automated mechanical movements. But human flesh has a face—just what Levinas wants to uphold.

In another place the Cartesian order is said to be prior to the Socratic order relative to teaching. But again what can the *res cogitans* teach to an other, or be taught itself? What is it taught by the idea of infinity? That God exists. But this is about all that is taught. Descartes is entirely lacking in the passion of religious inwardness that we find, for instance, in Augustine, Pascal and Kierkegaard. In fact, for Descartes the self and God are the two things most easily known, and once Descartes has placed them as foundational concepts to certify rational knowing methodologically, he gets down to the real business at hand: mathematicized science of nature. This Cartesian order of objective *mathesis* proves all but oblivious of the inward otherness of the self and the superior otherness of the divine transcendence. These become methodological means to an end, not enigmatic, mysterious realities that tax all thinking to the utmost, indeed defeat all its claims to the conceptual mastery, such as Descartes ardently pursued.

How superior here is the Socratic dialogue wherein the promise of openness to the other is inscribed from the outset. Levinas has nothing to say about dialogue as already articulating a concept of the soul that in its being is essentially relational; thought is never *kath' auto* in a manner that excludes relativity; for such a *kath' auto* would exclude the possibility of the face-to-face. Socratic dialogue is philosophical speech face-to-face. There is an implied Socratic sense of bodied speech—speech in the sight and in the hearing, and indeed within the touch of the other. Speech in a Socratic dialogue is as much a self saying as a something said.

Levinas's theme of the face-to-face must be noted here. This is his distinctive contribution to the discussion of 'intersubjectivity'. German idealism and phenomenology bequeathed the problem of the other: starting with subjectivity how do we genuinely constitute relatedness to the other as other? Is the other merely the means by which I recognize myself and return to myself? Is the other, seen from the primacy of the subject, just the mirror in which the self sees essentially itself, hence no radical otherness can ever be defended? As an heir of phenomenology and not German idealism,

Levinas confronts phenomenology's same starting point in the subject. Levinas too starts with the self, in that earlier parts of *Totality and Infinity* are predominantly devoted to showing us a sufficiently strong sense of the *separation* of the self for itself. The self for itself is an irreducible ipseity that cannot be subsumed into an impersonal reason, or made the instance of an abstract universal. And yet this for-self in its radical separateness is not a transcendental ego. It is invested with the concreteness of the existing I in its primordial enjoyment of being.

How then is the problem of the *inter,* the 'between', tackled? The self expresses itself and enters into discourse and language. Expression for Levinas is such that the speaking subject always attends his or her expression. He or she does not abandon expression but attends it as willing to justify it, or indeed justify himself or herself, that is to say, apologize. To apologize does not here mean to ask pardon simply; it implies one standing there for oneself and owning up in expression to what one is or does. An apology, like Socrates', is a self-justification; the justice of the self in its personal particularity is at stake. But one apologizes always *before the other*. One attends one's expression in the sight of an other. Hence expression and the apologetic attending of expression by the self is an entry into social relatedness, is the social relation.

This entry of justification, justice, apology, attention of self before the sight of the other, comes to expression in the face-to-face. I encounter the face of the other and the other looks on me, not like Sartre's other that would petrify me and reduce the freedom of interiority to an objectified thing. The face of the other calls me to justification, to justice. The face presents itself with a nudity and destitution that is beyond all conceptualization. The face cannot be totalized, for the infinite comes to epiphany there. I cannot conceptually determine the face of the other; the eyes of the other look at me with an unguarded vulnerability, and call me to a response that is beyond power. This unguarded vulnerability of the eye of the other is radically opposite to Sartre's look. If looks could kill, Sartre's subject would be a mass murderer. In Levinas's case, the look offers itself as the other offering itself in unguarded frankness; in that look there appears the command 'Thou shalt not kill'.

The ethical is not an instrumental contract that the self of will to power, be it Nietzschean or Sartrean or Hobbesian, makes to defend itself against the other and to launch its self-aggrandizing onslaught on the freedom of the other. The unguarded face is beyond all instrumentality and beyond all finality in the sense that it does not constitute a determinate purpose or *telos* that could be conclusively comprehended and mastered or encompassed. Something overflows in the face of the other that is infinite, and this infinite is the command of goodness. The overflow of infinity into the between, the *inter,* calls the subject in its separateness to a relatedness with the other that does not compromise separateness, since the very between is an ethical respect of justice between the self and other.

Levinas finds the face absolutely irreducible, primordial. One cannot break it down into more basic constituents; it is elemental, though not in Levinas's sense. It cannot be contained within the economy of classical subjectivity, whether idealistic or transcendental/ phenomenological. These latter finally give hegemony to the same over the other. While Levinas defends the separateness of the subject, the face-to-face and the overflowing of the other's infinitude reverse the hegemony of autonomy. There is a

heteronomy more ultimate than autonomy. The self is for the other; and the other comes from a dimension of height, even when the other is the abject self, the poor, the widow, the orphan.

Levinas intends to transcend the master/slave dialectic, but there are occasions where the other is referred to as the master, and where the asymmetry between the same and the other seems to skirt dangerously another form of the master/slave relation. We find a peculiar mixture of elements: the radical separateness of the subject, who is not really separate, since he or she puts himself or herself in the between by his or her expression; the subject who in the between encounters the face of the other who commands against murder in the nakedness of the vulnerable eye; the separate self whose ineluctable destiny seems social. How then is the other radically other and the self still irreducibly separate? For it is their co-implication and infinite responsibility that seem the most important things. Is this no more than a verbal problem? Levinas defends the irreducibility of the self in its personal singularity, and yet against Enlightenment modernity he reinstates a heteronomous ethics, where the justice of the other, assumed in infinite responsibility, is absolutely central.

Eros is important for Levinas in breaking out of monadism and the 'egocentric predicament'. This is linked with his stress on fecundity. One is reminded of the speech of Socrates/Diotima concerning *eros* as generating on the good/beautiful. *Eros* generates beyond itself on the beautiful/good. This is a somewhat strange saying. I take it to mean that the highest point of *eros* is not, in fact, erotic in the sense of yielding just a completion of a lack in the self, and hence a culminating self-satisfaction in a final self-relatedness. *Eros* seems to start in lack and in final satisfaction makes the erotic being self-sufficient again by overcoming the lack. But this is not enough. Rather, the self generates beyond itself on the good. There is a transcendence of self that goes beyond the most embracing self-sufficiency and self-relativity.

Fecundity is the self generating beyond itself. I would prefer to call it the promise of *agape* rather than *eros,* in that it does not fill a lack of satisfaction but goes beyond self in an overflowing of being that is already full, overfull. As already full in itself the self agapeically goes towards the other as other; in this case goes towards the child as an other who is not yet known as a this, and who is the promise of the future, a continuation and a rupture, a relativity and a radical separateness at once.

It is noticeable here that Levinas emphasizes the father/son relation, rather than the relation of father/daughter, or mother/son. Paternity and filiality become the means of expressing the fecundity, the infinitude of time in its generative power. The feminine reduces to a certain equivocal form of being. There is ambiguity in the relation of the father and son: I the father am the son; I the father am not at all the son.

Levinas makes much of the infinity of time against what he seems to see as the jealous self-enclosure of eternity. It seems as if the fecundity of infinite time will pardon all. I think this will not do relative to the singularity and sociality Levinas wants to emphasize. Time, even infinite time, will not radically pardon radical evil. Later generations cannot provide justification for the radical evils visited upon present generations. Levinas does not want to instrumentalize present evil. But is infinite time enough to prevent time from being swept up into the instrumental justification of world history? It can only be from an entirely different dimension that the pardon for radical evil can come. This would be

eternity in another sense to the one that Levinas plays with, namely, the catatonic absolute identity that knows no relativity to otherness. Levinas's reference to messianic time at the end of *Totality and Infinity* indicates that the work is a truncated book; its real import lies elsewhere.

For all the talk about the frankness of the face, and the person attending his expression, Levinas is perhaps a dissimulating writer. The entirety of *Totality and Infinity* points beyond itself to God, but God is foxily talked about throughout the entire book. One is reminded of the equivocation of discourse imputed to some Jewish thinkers, Spinoza for instance, or Derrida for that matter. In the present case, one speaks the language of atheism, while being a theist behind it all. Today the metaphysicians and theologians have to hide themselves from the inquisition of the atheist, while for the main part of recorded intellectual history it was the atheist who had to go in hiding in fear of the inquisition of the believer.

In Levinas's later work the sense of responsibility for the other is accentuated further. The claim that ethics is first philosophy is developed more fully. The central essay of *Otherwise than Being or Beyond Essence* is titled 'Substitution'. Here Levinas develops the idea of an anarchic subjectivity that is prior to all thematization. One is reminded of Sartre's non-positional consciousness, except that in Levinas's case the sense of being summoned by the other is to the fore; the self prior to the ego is marked by an obsession with the other. Levinas ties this with being a creature in which the trace of the absolute other is in passage.

'Substitution' is a bold and provocative meditation, brilliant and profound in many respects. I cannot do justice here either to its claims or to the questions it provokes. Levinas does claim that prior even to the absolute priority claimed for the transcendental ego, the call of the other in an infinite responsibility is at work. The concept of 'substitution' refers to the manner in which this anarchic self is a hostage for the other. It is in the place of the other; this power to be in the place of the other is the ground of all other acts of solidarity or sociality. The self is a subject in *being subject* to the other in infinite responsibility.

Levinas likes to quote Dostoevsky's Alyosha Karamazov: 'We are all responsible for everyone else—but I am more responsible than all the others.' This is a claim of hyperbolic responsibility, and some would criticize it as such. It may even ironically suggest an ethical hubris in which I place myself in the role of the absolute, substitute myself for God. Only God could be responsible thus, no mortal creature could. Yet Levinas wants to insist, and insist is the word, that human creatures are disturbed by this call of infinite responsibility. There are ambiguities here too complex to unravel in the space allotted. For substitution is a divine responsibility, substitution even to the point of death and sacrifice. Levinas is often presented as without precedents, and his singular style helps to foster this impression. But I cannot but remind the reader of the emphasis on testimony, witness and sacrifice in Marcel. Read in a certain way, Marcel's Catholicism and Levinas's Judaism generate some very deep affinities.

Levinas sets himself against transcendental phenomenology here and its regress to grounding in originary selfhood. He emphasizes the passivity, the patience to the other of the pre-synthetic self. Yet his mode of thinking, like transcendental philosophy generally, is regressive, a matter of what both call 'reduction'. Is there not after all a strange

'transcendentalism' in this? A transcendentalism of passivity rather than activity, or rather of patience to the other prior to both activity and passivity? This would be prior to the a priori of transcendental idealism. Substitution would be the condition of the possibility of all meaning, linguistic, cognitive, pragmatic as well as ethical. Ethics as first philosophy would then be a transcendental philosophy, though since it does not deal with the transcendental ego as the ultimate originary presence, it might be called an *atranscendental ethics* or a *negative transcendentalism,* on the analogy of negative theology.

Many of Levinas's ways of saying are strongly reminiscent of negative theology: It is not this, not that…; it is as if it were, as though…it is neither this, nor that…. There is a sense in which we here have to make a *leap* beyond phenomenology. There are times when that leap could be made more intelligible for the reader if Levinas provided some phenomenological examples from human relations, for instance in the telling way Marcel appeals to the examples from his own dramatic works to suggest imaginatively the non-objectifiable.

There is generally a tendency to *dualistic* thinking in Levinas, for example, ontology versus metaphysics, being versus the good. This tendency can lead to significant equivocity. I will conclude with a relevant example and question. In 'Substitution' Levinas unrelentingly stresses the irreplaceability of the self that is summoned in ethical responsibility. But how can the irreplaceable be substituted? There cannot be a replacement for the non-substitutable, nor a substitute for the irreplaceable. The concept of hostage carried the idea of *equivalence:* one for the other, a tooth for a tooth. But the concept of equivalence is impossible without the idea of identity, and Levinas's whole discourse of the irreplaceable claims to be prior to the idea of identity and its cognate concepts like equivalence.

This is a logical problem with substitution, but it points to a tension that is not merely logical. If we privilege the irreplaceable, there must be a limit to human substitution; by contrast, if we privilege substitution, we compromise the absolute singularity of the irreplaceable. How then can we affirm substitution and the irreplaceable both together? Put this way: Job's second set of children seem to be replacements for the first dead children, they seem to be substitutes. But the whole thrust of Levinas's thought must be that there can be no replacement for the first irreplaceable children; there are no human substitutes.

Do we reach the limit of human substitution? And a limit of the fecundity of infinite time? Is there such a thing as divine substitution which would radically transfigure the notion of selfhood as irreplaceable? Do we need the idea of re-creation, the idea of a new creation to deal with the irreplaceability of the first creation, relative to the horrors we have heaped on it and its seemingly senseless death?

CHAPTER 6
Philosophies of science

Mach, Duhem, Bachelard

Babette E.Babich

THE TRADITION OF CONTINENTAL PHILOSOPHY OF SCIENCE

If the philosophy of science is not typically represented as a 'continental' discipline it is nevertheless historically rooted in the tradition of continental thought. The different approaches to the philosophy of science apparent in the writings of Ernst Mach, Pierre Duhem and Gaston Bachelard suggest the range of these roots. But for a discussion of the tradition of continental philosophy of science—as the term 'continental' characterizes a contemporary style of philosophic thinking—it is important to emphasize that while Mach, Duhem and Bachelard may be said to be *historically* continental, a properly continental-style philosophy of science should not be ascribed to any one of them. Contemporary philosophy of science is pursued in what is largely an analytic or Anglo-American-style philosophic tradition. And Mach, Duhem and Bachelard made the formative contributions for which they are known in the philosophy of science within this same almost quintessentially analytic framework.[1]

Nevertheless, this very necessary historical precision is itself witness to a changing circumstance in mainline philosophy of science. Although continental philosophy has been marginalized in professional philosophy in general, and where this marginalization has perhaps been greatest within the philosophy of science, the very centre would seem to have shifted. In past years, traditional philosophers of science have begun to broaden their analytic conception of the philosophy of science to include approaches compatible with or even drawn from continental styles of philosophy. Such approaches reflect the philosophical reflections on science expressed from the tradition of important individual continental thinkers such as Edmund Husserl (Gethmann, Heelan, Orth, Rang, Seebohm, etc.) and Martin Heidegger (Gadamer, Heelan, Kisiel, Kockelmans), Habermas and Foucault (Radder, Rouse, Gutting), and even Friedrich Nietzsche (Babich, Maurer, Spiekermann). In this context, the philosophical reflections on science to be found in Mach, Duhem and Bachelard may be mined for what should prove to be a productive historical foundation between these two traditions addressed to a common focus. Exemplifying such a common focus, the philosophy of science is not inherently or essentially analytic if it is also not obviously continental.

The question of stylistic conjunction between continental and analytic philosophic perspectives is complicated and, before it can be addressed, one further preliminary clarification is necessary. Because of the possibility of geographic confusion, it must be emphasized that the rubric 'continental' in the context of the philosophy of science does

not pertain to the geographic locus of the European continent except historically and circumstantially. Despite German and French scholars interested in specifically continental approaches to the philosophy of science in contemporary European philosophy, the character of the philosophy of science is decidedly analytic. It is telling and to the point in this last connection that Wolfgang Stegmüller, familiar as he was with traditional philosophy including phenomenological approaches, could find the appeal of analytic philosophy for a formalist and foundationalist interest in scientific theories so inspiring that he devoted his own life to its dissemination and through his influence analytic styles of philosophic thought consequently assumed their current leading role in German philosophy of science. In turn, this means that continental philosophy (and philosophy of science) remains as professionally marginal on the 'continent' as in English-speaking scholarly domains.

But if not defined as the dominant tradition in philosophy and if not a matter of geographic reference, continental philosophy (especially with respect to philosophic reflection on science) is also a multifarious tradition and not a single style or school. Just as Rom Harré could speak of 'philosophies' of science,[2] it is best to speak of 'continental philosophies' and hence of 'continental philosophies of science'. Not necessarily linked by 'family resemblances'—for example, Husserlian-influenced thinking bears almost no resemblance to Habermasian or Foucauldian social, critical theory—what is called 'continental philosophy' comprises several conceptual traditions and reflects a manifold of differing styles of philosophy with cross-disciplinary influences and applications. But one general characteristic might be said to be a strong historical sensibility. This sensibility distinguishes continental philosophic styles from analytic (progress-oriented and often expressly ahistoricist and sometimes expressly anti-historical) styles of philosophy. A critically reflective historical sensibility in addition to an explicit reference to lived experience—the *life-world* of Husserlian and Diltheyan usage—indicates some of the major advantages to be brought by continental styles of philosophy to the broader and general philosophic project of reflection on science.

It is this historical dimension and reference to life (practice, experience, etc.) that makes continental styles of philosophy so important for the philosophy of science today. Since the radical critique of the received, analytic style of modern philosophy of science through the writings of N.R.Hanson and the work of Thomas Kuhn and Paul Feyerabend, contemporary philosophy of science has been increasingly transformed by an intensified and today decisive sensitivity to the importance of historical and sociological studies of actual scientific practice. The turn to history so characteristic of Mach's as of Duhem's philosophic writing on science, witnessed by their valuable contributions to the history of science, and implicit in Bachelard's reading of the culture of science, has come to be recognized as an irreducible component of the philosophy of science. In the same way, the resources of continental philosophy with a tradition of reflection on history seem increasingly essential to the practice of the philosophy of science beyond stylistic differences.

As *fons et origo,* the shared destiny and origin of continental philosophy and analytic philosophy is evident in a recent trend reviewing the connection between Husserl and Frege (Hill, Wiener, Cobb-Stevens, Dummett), suggesting that Husserlian-style philosophies of science may go furthest towards bridging the stylistic gap between

analytic and continental philosophy. Likewise it is significant that the philosophy of technology, related to the philosophy of science because of its importance for reflection on experimental science, not only features continental practioners (Ellul, Ihde, Jonas, Schirmacher, Winner, Zimmerman) but is in its rigorously philosophic aspect a direct resultant of this same tradition (drawing as it does on the work of Heidegger but also Ricoeur and Gadamer).

Although Mach's (as indeed Duhem's) positivist successors were ultimately to disregard his concern with history in their focus on the formal analysis and logical reconstruction which characterizes the hypothetico-deductive account of theory formation and justification and which in its most developed form came to be known as the 'received view', recent reviews of Mach seek to examine his philosophy of science in terms germane to its own reflective scientific constellation and philosophical project (Feyerabend, Haller) rather than merely in terms of its influence on the logical empiricist tradition of the philosophy of science (beginning with Frank). Thus a reassessment of Mach's philosophy of science stresses his historical interests, while Feyerabend emphasizes aspects in his work which anticipate the insights of Hanson and Kuhn (as well as Michael Polanyi who is, according to Alasdair MacIntyre, significantly underacknowledged in this connection)[3] in Mach's sensitivity to the element of finesse (or in Polanyi's language: 'tacit knowledge'). Discussion of the role of tacit knowledge or finesse represents the researcher's 'art', an an which, if we follow Mach's words, is *unteachable* in the sense of being inherently unamenable to the programmatic Baconian project and which project, conversely for its part, was held by Bacon to have its singular advantage in being manageable by underlabourers—that is, by technicians literally, as Bacon has it: without 'wit'. For Mach, precisely such a programmatization (automatization, industrialization) is not desirable even if it were possible. We may note that the actuality of what Derek de Solla Price called 'big science' has long demonstrated that such 'programmatization' is possible and Hugh Redner details the same in his study of giant, industrial-sized science.[4] Against the artless routinization of science, Mach held that an unteachable 'art' must be indispensable for the practice of experimental science because, in Mach's conception of scientific inquiry, it is the *sine qua non* of invention and discovery.

A turn to history and the role of the experimenter's art is not the only parallel resonance between continental philosophies of science and traditional analytic approaches: there are others. Despite stylistic differences, analytic and continental styles of philosophy share a common future as complementary approaches to the philosophy of science where both disciplinary styles can enhance one another. But what is inevitably more important than the prospects of such stylistic reconciliation on a scholarly level, it now seems eminently clear that the philosophy of science cannot be conducted from an analytic perspective uninformed by the hermeneutic turn or, as analysts prefer to speak of it: the *interpretive* turn (Hiley *et al*). In concert with the phenomenological turn (to the things themselves), the interpretive, hermeneutic turn represents the foundation of continental thought. And it goes without saying, or calling it hermeneutics, that the interpretive turn is a turn of thought in which, like the historical turn, the reflective advantage of continental philosophy comes to the fore.

In both existing and possible expressions, continental philosophy of science includes

approaches drawn from the larger tradition of phenomenology (as found in the works expressed by Hegel, Husserl, Heidegger, Merleau-Ponty) as well as hermeneutics (beginning with some say Vico, but certainly with Schleiermacher and Dilthey, and also Heidegger, Gadamer, Betti, Gramsci, Ricoeur). Continental philosophy also reflects the influence of structuralism in linguistics, semiotics, and literary criticism and psychology, as well as the Heidegger-inspired *Daseinsanalyse* and existential psychoanalysis (Piaget, Binswanger, Boss, Fromm, Merleau-Ponty, Sartre and Lacan). Related philosophic styles of deconstruction and recent postmodern conceptions of philosophy (Foucault, Derrida, Lyotard, Baudrillard) have had a decisive influence on late twentieth-century philosophic reflection on science in line with the hermeneutic perspective (Heelan, Kockelmans, Kisiel, Hacking, Böhme, Gadamer, Bubner). With specific reference to the philosophy of the social sciences, particularly representing the Frankfurt school, which often incorporates analytic-style distinctions in its focus on language and discourse (Habermas, Apel, Tugendhat), characteristically 'continental' influences are traced in a variety of lineages to Hegel or Schleiermacher, Marx or Feuerbach (Althusser, Bhaskar, LeCourt) and Kierkegaard or Dilthey, Heidegger, Weber, Simmel.

As representatives of nineteenth- and early twentieth-century empiricism and positivism, the particular names Ernst Mach (1838–1916), Pierre Duhem (1861–1916) and Gaston Bachelard (1884–1962) have of course and as already noted much more than a merely historical significance. In analytic philosophy of science, an ongoing tradition of reinterpretations of their work continues to influence the current linguistic or theoretical crisis in analytic philosophy and semiotics/semantics of scientific theory (Duhem not only as represented by W.V.O.Quine but also Stanley Jaki) as well as, on the other hand, the current emphasis on experiment representing the counter-absolutist turn to the history (and historiography) and practice of science in the philosophy of science (specifically Mach, as represented by Feyerabend and others, and Bachelard—and in routine conjunction with analyses of Michel Foucault—for Bruno Latour, Ian Hacking, Mary Tiles, Gary Gutting).

MACH AND THE POSITIVIST CONNECTION: FROM ELEMENTS TO PHENOMENOLOGY

Ernst Mach was born in 1838 at Turas, formerly in Moravia—a region to be found in Bohemia, Silesia, and lower Austria which later was to become part of the modern republic of Czechoslovakia and is now part of the Czech republic. He studied in Vienna, teaching physics there in 1861, becoming professor at Graz in 1864, then at Prague in 1867, finally at Vienna in 1895. In 1901, upon his appointment to the upper house of the Austrian Parliament, Mach gave up his Vienna chair in the history and theory of inductive science. He spent the last three years of his life living with his son, Ludwig Mach and died in 1916 at Haar, near Munich.

At the risk of inviting distracting historical confusion, the above listing of the details of the historical name-changes concerning Mach's original nationality and the proper name or country of his birthplace—where names such as Moravia, Bohemia, Silesia, Lower Austria or, indeed, Czechoslovakia do not *currently* denominate legitimate nations within

today's Europe—dramatizes the fortunes of the Austro-Hungarian empire and eastern Europe as well as the philosophy of science conceived within the broad European tradition of natural philosophy. Although this is also given as Galileo's achievement in historical accounts of science, it is usually claimed that the tradition of natural philosophy was transformed by Newton himself into modern physical science. But this is only to say that the practice of science (*natural* science) came to be regarded as identical to the practice of the more speculative and often explicitly metaphysical tradition known as natural philosophy, and, conversely, that the practice of natural science was identified with natural philosophy. By the turn of the century, the project of the philosophy of nature was identified with the project of natural science. In Mach's day and well before, then, philosophy (including the philosophy of science or natural philosophy) was not thought to be necessarily separate and distinct from (understood as a business of reflection, interpretive or speculative, either subsequent to or independent of) the physical or natural sciences in both theoretical and experimental manifestations as Duhem and more recently Jardine and Crombie have shown. As Kurt Hübner has it, 'theory of science coming into prominence at the turn of the century was still closely tied to the study of the history of science. Names like Mach, Poincaré, La Roy and especially Duhem clearly bear witness to this. However this development ceased to follow the path opened up for it by these men.'[5] Here we may add that the divisions between philosophy and science and between philosophy of science and other kinds of philosophy were not always the same. Thus the debate between Hobbes (a speculative philosopher not merely a theoretician) and Boyle (an experimentalist not merely a physical scientist) or Berkeley and Newton were not regarded by either the participants or their contemporaries as taking place across, let alone mixing, categories (of philosophical speculation or hypothesis and scientific experiment and theory). For Mach and Duhem, the importance of philosophic reflection was to be evaluated with respect to its contribution to the progress of science. Thus retaining a defining reference to and even identification with *natural* science (as) *natural* philosophy, *philosophia naturalis* acquired the methodological, historical and epistemological profile of what would later become modern philosophy of science. Around the turn of the century, as practised by Henri Poincaré and by Duhem, philosophy of science bore the name *critique des sciences* and this same science-critical emphasis (that is, philosophical critique expressed for the sake of scientific advance or progress) is echoed in Mach's empirio-criticism. Under the influence of Wittgenstein, Carnap and Schlick, Hempel's mature expression of the 'received view' of the philosophy of science or the hypothetico-deductive expression of professional analytic-style philosophy of science represents a decisive and increasingly bankrupt departure from this late nineteenth-century tradition of *critique des sciences* with its particular and explicit reference to science in practice.

Almost from its inception then, the analytic tradition of the philosophy of science lacked any reference to the historical 'fortunes' or 'scenes' of actual scientific inquiry (Jardine). If the 'new science' of the seventeenth century had involved a transformative turn (whether revolutionary and world-shattering as Koyré maintains or evolutionary and therefore less radical a transformation as Duhem and Crombie would argue) to experiment, analytic philosophy of science has so far found itself less able to complete the same turn. If the difference is between, as the Galileo experts have it, Platonic

(formal) speculation and Aristotelian mathematical (functional) science, philosophers of science have tended towards Platonism. The turn away from history characteristic of logical positivism was only an expression of this idealizing, analytic tendency.

Although Mach in particular was especially devoted to experiment and its context in the history of science, many analytic authors nevertheless hold Mach to have been responsible for the divorce of traditional philosophical (metaphysical) concerns from the historical sensibility of the application of philosophic reflection to scientific practice. This is a misprision of a devastating kind but it was a constitutive one: seminal for the professional development of analytic-style philosophy of science.[6] The separation between philosophic expression and the lived world characteristic not only of logical positivism but of the division between continental and analytic styles of philosophy is no accident of location or tastes, as the talk of 'styles' may suggest. Rather, a necessary consequence, it might be argued, of the self-definition of modern science (as distinct from medieval and ancient science), the gap between theory and practice has shaped the analytic tradition of the philosophy of science, while at the same time leaving the philosophy of science as a theoretical discipline (*qua,* philosophy) addressed to a particular theoretic practice (science) singularly unable to support the disjoint consequences of a separation between theory and historical practice.

Despite Mach's 'physicalism' or 'phenomenalism', the members of the Vienna circle, in the telling words of one commentator, 'wrote as though they believed science to be essentially a linguistic phenomenon'.[7] Hence this disposition to analyse 'language'—be it ordinary or logical language—together with a naive (non-historical, non-hermeneutic or ideal) view of *direct* observation (i.e., observation sentences) effectively limited the analytic concern of the philosophy of science to the analysis of theory, which last is the project of the received view or hypothetico-deductive nomological ideal of science (theory).

Such a focus on the elements of language—and not on the elements construed according to Mach's conception as *physical-physiological-psychological*—separates language and world. One obvious advantage of such a focus is the advantage of certainty. But this, its strength, to paraphrase Mach, and as is so often the case, is also its weakness. Philipp Frank, one of the founding members of the Vienna circle, who expressed the virtue of scientific analyticity, combining the essence of Mach's insights with Duhem's Kantian conventions, explains, 'the principles of pure science, of which the most important is the law of causality, are certain because they are only disguised definitions.'[8] If the essence of tautology or logical linguistic self-reference is not problematic when what is analysed is language use (the game or its rules), this same tautological expression becomes problematic when what is analysed must correspond to scientific facts or empirical matters. As Harré has observed, 'the philosophy of science must be related to what scientists actually do, and how they actually think'.[9] The imperative for such a correlative project between the philosophy of science and scientific practice, corresponding to the force of the socio-historical turn that comes after the linguistic turn, represents a much-needed philosophic mandate for the philosophy of science.

The revolutionary shifts, reversals and paradigmatic conflicts within the analytic tradition of the philosophy of science also correspond to the revolutionary shifts, reversals and paradigmatic conflicts in physical science. These witness to the need to

develop a ‘new’ philosophy of science appropriate to the ‘new science’. But the history of science tells us that novelty is itself relative, for the history of science is just such a record of ‘new’ sciences. One of the first ‘new sciences’, that of Galileo and Newton (and Hooke and Boyle), inaugurated a tradition that has since developed beyond its initial programme. That tradition was the tradition of modernity (as the cult of the new), and if one can speak of postmodern science today that is just because the programme of modernity can no longer be viewed unproblematically. The fortunes of the ‘new’ science and enlightenment thought mirror the problem of modernity and postmodernity, the problem of the conflict between the grand narratives of science and society and the distintegration of the promise of those same narratives throughout the modern era. This is not unconnected to the new historical and social turns in philosophic thinking about the sciences. These turns are not a sign of the times so much as they reflect a tension interior to post-Galilean science. As Mary Tiles explains the dynamics of this internal tension in post-Galilean (or ‘new’) science: ‘The new science was to be abstract and mathematical, but also experimental; it was to yield both enlightenment and mastery of nature. It was to strive for an objective, purely intellectual, value-free view of the world in order to improve the lot of mankind by rendering technological innovations possible.’[10] There is an inherent conflict in this juxtaposition of material, practical progress and ideal or objective knowledge. Today’s post-analytic or ‘new’ philosophy of science is manifestly directed to an expression of the consequences of this conflict.

Here, with reference to Mach’s own particular historical context, it must be observed that Mach’s declared opposition to philosophy—even where such an opposition may be rendered on Pascal’s account as the best affective precondition for the best kind of philosophy—is, if taken literally as applying to philosophy today, anachronistic. Mach wished to avoid identification with the more metaphysical fashions often associated with or characteristic of philosophy. But his reflection on science was nothing other than a philosophy (albeit a philosophy of nature). This point highlights the value of a return to history for the sake of the broadening illumination of context. And where the return to history represents Mach’s own phenomenalist version of Husserl’s phenomenological call to return ‘To the things themselves!’, it cannot truly be Mach who is to be blamed for the logicization of the philosophy of science.

In all, the history of modern philosophy of science may be said to begin at the juncture epitomized by Mach’s biography; but the rupture between theory and experiment that followed from the increasing logicization of empiriocriticism or critical positivism related to the rise of analytic-style philosophy of science has no precedent in Mach. This point is essential if one is to understand the growing attention paid to Mach’s historical emphasis along with his very prescient sense of the importance of the art of the researcher, of the technical and social flair essential for the practice of the experimental life of the sciences.

Mach was greatly influenced by Berkeley and Fechner as well as by Kant and Hume. His thinking on the logical ‘economy’ of thought was shared by Richard Avenarius and his views on the nature of science engaged not only the scientists Helmholtz, Kirchhoff, Boltzmann, Einstein and Schroedinger but also the American pragmatist philosophers James and Pierce. It has been suggested that Mach’s concern was to understand experience. But this concern with experience was not the same as the anglophone preoccupation with sensation. It has already been noted that many authors also tend to

associate positivism's characteristic distance or alienation from the world with Mach's scepticism. Given Mach's sympathy with Berkeley and Hume, such an identification is not surprising. Mach's philosophy of science is commonly described as a 'sensationalism' or 'phenomenalism', expressed as an 'idealism', or by the catchwords positivist, empiricist, and anti-metaphysical. Endowed with the radical scepticism of a working scientist, as Mach was and because his sensationalism does not express an ontology as such, it is best to understand his perspective as fundamentally or even propaedeutically *heuristic*. Hence whatever metaphysical interests Mach may have had, they are not propositional but rather reflect his project of articulating what Paul Feyerabend describes as a non-foundational epistemology, and such an epistemology is not only essentially scientific but also represents the philosophic spirit of epistemology as such. In the same way, reference to a simplistic notion of parsimony, or *Denkökonomie,* linking that principle to an ontology, is misguided. And without emphasizing the extreme and today uncommon philosophical breadth of Mach's interests, the claim made in his *Analysis of Sensations* (1886) that 'the world consists only of our sensations' must be confusing. Again, Mach does not reduce the world to sensation so much as he finds the world *given in* and, as both Duhem and Bachelard would also stress, *knowable* only through sensation: 'Science does not create facts from facts, but simply *orders* known facts' *(Popular Scientific Lectures)*. It is this connection that suggests a natural affinity between Mach's elemental phenomenalism and Husserlian phenomenology borne out by Mach's initial (and then specifically continental) reception (Brentano, Musil, Dingler) and which has more than once been reviewed in its connections not only with Husserl but even with Nietzsche (Sommer, Gebhard).

Mach deliberately sought to distance himself from the metaphysical pretensions of traditional philosophy as well as those assumed (sometimes by scientists) in the name of science. Like Duhem, Mach eschews the claims to certainty which have come to characterize traditional scientific expression and serve as an identifying feature of today's analytic heirs to the logical positivist tradition of the philosophy of science. For Mach, as for Duhem and Bachelard, *enquiry,* conceived via experiment, was the benchmark of the scientific enterprise and a classical but not necessarily pyrrhonian scepticism was the best guarantee of such an enquiring or open attitude. But this scepticism did not mean that Mach gave up any claim to offer an account of the scientific knowing enterprise, with respect to either practice or progress. Hence William James upon meeting Mach in 1882 could write not only that he had 'read everything' but that he 'knew everything'. James was not merely impressed with Mach, polymath extraordinaire, but by Mach's *pragmaticist* turn, which is one way to understand the very practical but not ontological imperative guiding Mach's endorsement of a logical economy. In this way, Mach's thinking illustrates the continental spirit of philosophy as questioning conceived in that *authentic* sense charac-terizing what Martin Heidegger calls thinking and which Nietzsche critically pronounces as the highest scientific virtue: intellectual probity or *Redlichkeit*. In Mach's *Popular Scientific Lectures* (1882), starting from the axiom that 'Physics is experience, arranged in economical order', such a questioning or open-ended reflection means that a philosophic consideration of the goals of science following the ordering value of economy as a thought principle is not proposed as or purported to yield a finished system: 'In the economical schematism of science lie both its strength and its

weakness. Facts are always represented at a sacrifice of completeness and never with a greater precision than fits the needs of the moment.' This very Aristotelian practicality, which Gadamer has expressed in another context as the prudential core of hermeneutic judgment, works on Mach's account to exclude anything like 'absolute forecasts'.

Considered on its own terms, Mach's view is an *elemental* sensationalism, a factual, specifically non-factitious or empiri[ocriti]cism. Mach's thinking is radically sceptical. And it is a kind of conventionalism, like that of Duhem and Poincaré, which influenced the positivist protophysics of Dingler and the Erlangen school of Lorenzen's constructivism and its related development in evolutionary epistemology (Wuketis). But so far from the flat positivism of a reduction of the world to fact, Mach's 'mental mastery of facts' offers the only understanding to be had from or about those same 'facts', where the question of order or mastery in each case is hypothetical and ever subject to revision. This perspective in its historicist extension explains Mach's positivist appeal but an attention to the elemental mentality of this 'mastery of facts' shows its fruitfulness for current issues. This is evident in contemporary analytic philosophy of science after Kuhn and Feyerabend.

Thus Mach proposes that if the future of science may not be forecast as such (on pain of abandoning the open enterprise of science itself), its non-absoluteness may nevertheless be surmised and he suggests, in a fashion that is as Nietzschean as it is radically, elementally pluralistic, reflecting the spirit of what today has come to be called the 'new physics'—and what might likewise be named the 'new biology' and the 'new ecology'—that 'the rigid walls which now divide man from the world will gradually disappear; that human beings will not only confront each other, but also the entire organic and so-called lifeless world, with less selfishness and with livelier sympathy' *(Popular Scientific Lectures)*.[11]

It has been noted that Mach sought to articulate the project of science in terms of its history and its practical or working functionality. But Mach's particular historicism was that of a philosopher—in spite of his protests against such an identification, where, as was also noted in a preliminary way, these protests themselves must be interpreted with reference to Mach's own, historical, circumstantial context. As a philosopher, Mach's historical focus shows him as a positivist, in the original, pristine Comtean sense of the word.[12] Ian Hacking, in a timely effort to broaden the current flattened and negative reading of 'positivism' with reference to August Comte's original use of the term, defines *positivity* as 'ways to have a positive truth value, to be up for grabs as true or false'.[13] Positivistic to this extent then, not only was Mach a philosopher, but he was a quasi-analytic—if also as we have seen a proto-phenomenological and even hermeneutic—kind of philosopher. Moreover, Mach remained as consistently committed to expressing the logical and philosophical foundations of science as any member of the Verein Ernst Mach (which was in fact and significantly the original name for the Vienna circle) or the modern heirs of the logical empiricist tradition in analytic philosophy of science.

Yet it must be emphasized that Mach was committed to the positivist ideal of science, that is, in Hacking's Comtean sense, to its 'positivity' but not its sheer logical expression. Thus, and, as we shall see, like Duhem, Mach's critical analytic turn far exceeds anything like an exclusive commitment to the expression or clarification of scientific method or theory as an end in itself where he criticizes the working functionality of the latter. More

critical than Kant, Mach believes that there is no possibility of a priori knowledge *as such:* the basis of *all* knowledge is sense experience. Mach's *elementalism*—as his 'sensationalism' is best described as outlined above and following the letter of Mach's own account—repudiates the 'arbitrary, one-sided theory' which is implied in talk of 'sensations' or 'phenomena'. This is important, for what Mach repudiates as 'arbitrary, one-sided theory' focusing upon 'sensations' or 'facts' represents the idea of the self or subject apart from or as substrate underlying or undergoing such 'sensations'. In this way, Mach's elementalism mirrors the critique of the subject familiar to continental scholars and others acquainted with the works of Nietzsche and Freud, as well as Heidegger, Lacan and Wittgenstein. As the central tenet of Mach's psychology, the self is a bundle of elements, an expression which must be understood not as Locke or Berkeley would understand it but rather as signifying a fundamental continuity between the unit of the perceiving self, or the physiological (elemental) subject, and the mental matter of psychological (elemental) knowing and the physical (elemental) world. Physical, physiological and psychological, Mach's convertible elements comprise his elementalism. This continuity suggests the *intentional* commonality requisite for developing a phenomenological reading of Mach's 'sensationalism' in the line of Husserl. This same connection also suggests the relevance of Mach's thought for interpretations of quantum physics. Mach's principle, so important on Einstein's own account for Einstein's theory of relativity, implies the interdependence of all things—that is: relativity (Mach's own views concerning relativity are no matter in this context). Hence there is no need for an absolute frame of reference (whether Newtonian space or time) but only for a relative frame of reference. The law of inertia stated by Newton can be understood either from the perspective of the body at rest or motion or from the related perspective of external impingent forces.

Scientific laws for Mach are abstract, general, and in all we might say: *abbreviated* descriptions of phenomena. The value of such laws, the 'meaning' of such laws for Mach, as for Nietzsche and Wittgenstein, lies in their use: their value for prediction. This too is not an ontological statement. Since Mach is not concerned with absolute truth as is the more metaphysically inclined philosopher of science, he is free to share the physical scientist's focus on working utility. It was this dedication which led to Mach's notorious repudiation of unobservables (unusable—untestable) as explanatory components in the atomic theory of physics and chemistry. Needless to say this prejudice, like his emphasis upon the researcher's 'unteachable' art *(Knowledge and Error),* has acquired the triumphant patina of prescience which is the fruit of a convergence with contemporary science, for today's atomic theorists have since discarded the nineteenth-century mechanistical vision of the atom.

PIERRE DUHEM AND THE DAMNATION OF RELIGION: THE LIMITS OF ANALYTIC REHABILITATION

Pierre Maurice Marie Duhem was born in Paris in 1861, a son of a businessman of Flemish descent. Duhem's mother could trace her origins to the south of France and the village of Cabrespine, near Carcassonne, to the very house where Duhem himself was to

die at the age of 54. In 1882, Duhem entered the Ecole Normale Supérieure at the head of the yearly competition. Proving his initial promise, Duhem completed a dissertation in thermodynamic physics in only three years. But through no evident fault of the work itself, Duhem's dissertation was none the less rejected by a jury headed by Gabriel Lippman. Two years after this first academic frustration, Duhem would successfully submit another thesis in thermodynamics, to earn his doctorate (in mathematics). Duhem's rejected first thesis was not only subsequently published but published to a broad and approbative scholarly reception. We shall have cause to note below that the complicated circumstances of this rejection are important for understanding Duhem's intellectual and academic career. In 1887, Duhem became *maître de conférences* at Lille, where he taught physical mechanics. Following a pedagogic dispute at Lille, Duhem moved to Rennes in 1893, but soon afterwards took a chair at Bordeaux in 1895, which he occupied until his death in 1916.

Duhem's philosophic interest in scientific theories is seen in his still-influential 1906 book, *La Théorie physique: son objet, sa structure (The Aim and Structure of Physical Theory)*. Duhem, who shared Mach's belief in the vital importance of history for scientific progress, also made significant and substantial contributions to the history of science with his *Les Origines de la statique* (1905–6) and his voluminous study of medieval cosmology, *Le Système du monde* (1913–58), for the most part published posthumously and which has recently appeared in highly truncated form in English translation as the one-volume *Medieval Cosmology*.

If a discussion of place names can illuminate the changes necessary for an understanding of the transformation of natural philosophy into the kind of philosophy of science familiar today, the absent name of Paris is significant for understanding Duhem's intellectual position in that same tradition of the *critique des sciences*. For Duhem to all appearances had, with the submission of his first dissertation, opposed a then leading scholar, Marcellin Berthelot.[14] Duhem's biographers are largely agreed in reporting that the reasons for the jury's refusal of the thesis stem from the offence given to Berthelot in Duhem's theoretical repudiation of Berthelot's thermodynamical views on minimal work. And, indeed, more than a motive indicating a subjective and not an objective reason on Berthelot's part, we also have a tacit confession. In a 1936 biography written to secure support for the posthumous project of editing and publishing the remaining volumes (ultimately to number ten in all) of Duhem's *Système du Monde,* Duhem's daughter, Hélène, reported Berthelot's oft-cited professional edict which consigned (or better said, effectively damned) the Parisian-born Duhem to the provinces: 'This young man will never teach in Paris.'[15]

But to leave the question of the merits of Duhem's first dissertation to one side, and likewise to reserve the related question of the tactical wisdom of offending the leading scholar of one's day (for, as a recent biographer of Duhem's life and work, R.N.D.Martin, has observed, both are more properly questions to be directed to Duhem's teachers at the Ecole Normale than against Duhem himself), I would note that Berthelot's personal antagonism towards Duhem nevertheless retains resonant dimensions which exceed the indignant prejudice of the offended vanity of a leading Parisian scientist. For, betraying something more than a personal idiosyncrasy, Berthelot's views echo the general tenor of Duhem's philosophical reception, both then and now, where at least for

our times it may be assumed that questions of professional conviction and ego are not similarly relevant. Nevertheless, questions of personality, understood in the broad, psychological and, in Duhem's particular case, confessional sense, play an essential role. Hence it is not insignificant that we are informed again and again that Duhem was a Catholic. Thus the newly published contribution to Duhem scholarship by Duhem's foremost English-language commentator, Stanley L.Jaki, bears the title *Scientist and Catholic*. Jaki, himself a priest, certainly does not mean to underline this conjunction unsympathetically. But Duhem's religious faith is common stock in reviews of his philosophical merit. And an evaluation of the objective significance of Duhem's faith with respect to Duhem's historical circumstance is not easy. And Martin's study of Duhem's intellectual biography, appropriately subtitled *Philosophy and History in the Work of a Believing Physicist,* begins by adverting to the significance of the specific fortunes of Duhem's intellectual reception. Martin notes that Duhem's work is from the start clouded by a number of persistent critical reservations. Thus it is essential to underline the fact that a French scholar of importance as, beyond all dispute, Duhem must be accounted, should none the less be denied, as Duhem was denied, a Paris chair. Whereas Bachelard, born in the provinces, and mentioned here for the sake of contrast, would not be similarly denied this same token of recognition. The difficulty here in the case of Duhem, arguably the superior philosopher, surely the superior scientist, is to trace the proximate cause.

In the conflict with Berthelot, reservations concerning Duhem's achievements preceded Duhem's scientific and academic career. Martin sums up the general scholarly judgment with respect to Duhem's historical stature with the resounding ambiguity of an understated reservation as, in a word, 'problematic'. For many, Martin writes, Duhem was 'a brilliant maverick who continually got things frustratingly wrong: producing brilliant arguments against atomic explanations in physics and chemistry, a muddled instrumentalism in the philosophy of science, and a voluminous collection of misreadings of mediaeval Scholastics' ([6.50], p. 194). In general, for Duhem's biographical commentators and interpreters, that is for Martin, for Jaki, Roberto Maiocchi, etc., Duhem's problem was fundamentally and in its essence a religious one, and, like most confessional affiliations, this was one that cut two ways. Not only was Duhem's Catholic faith an obstacle to the largely Protestant ideals of modern science but Catholics were uneasy with his totally modern (and in the Catholic view 'modernist') opposition to neo-scholasticism. Duhem for his part was an iconoclast, and his position in the provinces was not such as to inspire him to restraint (Duhem, let it be remembered, despite his lack of a Paris chair, was a native Parisian).[16] He was particularly impatient with the neo-Thomism of the day, evident in the works of Jacques Maritain with his quasi-Aristotelian classification of the sciences. In the long run, what this meant was that Duhem could be dismissed as a Catholic apologist by non-Catholics while simultaneously being condemned as 'modernist' by the French Catholic intellectual elite.[17] And these reservations made on two sides were not the result of unthinking prejudice on one side or the other, but were in fact founded at least to some degree in both cases. For it is clear that the realist metaphysics and authoritarianism of the aims of the neo-scholastic movement in philosophy were undermined by the substance of Duhem's views. Conversely, Duhem's non-Catholic readers could regard Duhem's historical interest in

medieval science as representing little more than another version of neo-scholasticism. The historical researches of Crombie and others suggest that the problem requires a clearer understanding of the differences between historical eras rather than matters of faith, but Martin's observation that 'Duhem seems to have fallen between every available stool' ([6.50], p. 211) would seem to be the least one could say not only of Duhem but of the judgments made concerning him. What the new concern with history illustrates is the value of Butterfield's insight that a 'Whig interpretation of history' (or 'presentism' as it is also called)—that is, an interpretation of other eras from the perspective of one's own era—illuminates only one's own prejudices (and that only from the point of view of a subsequent historiographer) without shedding light on the period in question. History without hermeneutics is blind.

Against Koyré's reading of the revolutionary transformation from the medieval to the modern world-view, which corroborates the non-or anti-Catholic reading of Duhem's reactionary scholasticism, Jaki maintains that Duhem's sympathetic account of the scholastic opposition to Aristotelian philosophy of natural place suggests that this medieval perspective fostered rather than hindered the modern scientific turn such as that associated with, for example, Galileo's speculations concerning the role of impetus. Other scholars, such as William Wallace, have offered corroborating readings of the 'Galileo affair', showing the importance of taking Galileo's terms not in a putatively modern context (following the conviction of Galileo's visionary genius) but in their more patent and for the modern reader all the more tacit historical and that is medieval context.[18] Wallace's discussion of Galileo's use of the Latin term *ex suppositions* illustrates this point.[19] The problem is not only that readers from the perspective of modern (analytic) philosophy of science tend to translate *ex suppositione* as *ex hypothesi,* but that the perspective of the Catholic Church is automatically identified with that of an anti-modern, progress-retarding influence. This, in the apposite context of the contest between religion and science, shows the tenacity of the Whig interpretation of history. For this reason, Butterfield writes, 'It matters very much how we start upon our labours—whether for example we take the Protestants of the sixteenth century as men who were fighting to bring about our modern world, while the Catholics were struggling to keep the medieval or whether we take the whole present as the child of the whole past and see rather the modern world emerging from the clash of both Catholic and Protestant.'[20] For Butterfield the problem is the tendency to reduce the problem to one between Protestant and Catholic, between *enlightened* Whig and *darkage* traditionalist. To understand Duhem, one must go beyond confessional prejudice.

In fact, as Martin takes pains to demonstrate, Duhem must be characterized as a reluctant convert to his ultimately continuous account of the transition from medieval science to modern science. Duhem moved towards this view *in spite* of his own original views as a scientist working at the peak of the modern self-understanding of the sciences, that is, despite his typically scientific (high modern or scientistic) formation at the turn of the last century. According to science's own self-understanding then, and which is in part still true for scientists today, the transition from the (in Koyré's words 'closed') medieval view of the world to the ('open') modern world-view was—like the birth of the fully armoured Athena from the forehead of her father Zeus—a sudden, completely discontinuous or punctual, radical leap from classical and hellenic to fully-fledged

modern science. This view eclipsing the scientific value of the Middle Ages was as typical for the average scientist in Duhem's time as it can still be said to be true of scientists and of many philosophers today. Against the bias of this formation, it was less Duhem's religious faith, one could argue, than his rigorous education as a formal logician that brought him, indeed compelled him, to re-examine the historical record. In Jaki's view, a view now with considerable historiographical support, in addition to Duhem's axiom-atician's rigour, the record suggests that the medieval cosmological viewpoint worked not to obstruct the path to modern science in effect, where even Galileo's term *impeto* may be traced to Jean Buridan in the fourteenth century, but rather to further its advance. Duhem's reading of medieval science as an essential bridge between classical science and Galileo's inauguration of Newton's project of modern scientific thinking reflects a revolution, but the revolution for Duhem takes place in his own thinking, against his modern scientist's ingrained thought-style but in accord with his trained axiomatician's loyalty to the importance of first principles and logical coherence.

Duhem's argument stressed both subtlety and complexity, but it is clear that for him the key question for any theory or hypothesis was its utility in 'saving' the phenomena. On such accounting, of course, not only was Galileo a child of his times, indebted to the scholasticism of Oresme and Buridan, but Galileo's account was less successful than the Ptolemaic alternative. From this point of view, Cardinal Bellarmine's prudential caution may be read less as an illustration of jesuitry than as a representative of that kind of French common sense or Pascalian *bons sens* where the spirits of geometry *and* finesse intersect and for which, as both Martin and, years earlier, Dorothy Eastwood have argued, Duhem had a notable affinity. Yet beyond the still-unsettled questions of Duhem's personal reception, Duhem's significance for analytic philosophy of science is not in fact a subject of much debate owing to the prominence of the philosophers routinely listed as having responded to Duhem's influence, most notably Popper and Quine.

Duhem's argument against crucial experiments may also be seen to turn on his understanding of theories as axiomatic systems and his appreciation of the nature of such systems. For Duhem, physical experiments cannot refute isolated theories. Where alternative theoretical views are to be tested, an experiment designed to enable the experimenter to choose between them only confirms one hypothesis or another. But as an experiment confirms or refutes the theory and not the theoretical system, the results are inconclusive for not only may a subsequent experiment fail to confirm the theory, but a related experiment may refute a related theory; the experimenter is free to make ad hoc adjustments, and what has come to be called the 'theory-ladenness' of observations means that such adjustments may well be already or subsequently 'built into' the interpretation of the experimental results, without necessarily involving the awareness of the experimenter. Apart from such phenomenological hermeneutic questions as context-dependence and interpretation, the significance of the theory in any case is articulated only within the theoretical complex of which it is a part. Just as there are no isolated phenomena, there are no isolated theories but only theoretical systems. This interdependence points to the reason for Duhem's (as for Mach's own) conviction concerning the importance of history. Modification in the theory may preserve the system and vice versa, and an understanding of the system requires an understanding of the

original meaning of its terms. For Duhem, experiment is crucial, but neither falsification nor demonstration provides certain or sure tests of eternal, unchanging truth. On this point, it is the history of science which justifies Duhem.

Apart from Duhem's views on history and related to his views on theoretical indecidability, Duhem held a form of instrumentalism that was shared not only by Mach and Poincaré, but also by Kirchoff, Hertz, Bridgman, Eddington and the Copenhagen school of quantum physics. For Duhem, two aspects of theory must be distinguished, the explanatory and the representational. As far as Duhem was concerned, although scientists and philosophers of science of a realist bent regarded theories as explanation, the value of theory is ultimately its instrumental or conventional value. Instrumentalism is a view of scientific theories founded, as Karl Popper says, by 'Osiander, Cardinal Bellarmine and Bishop Berkeley'.[21] Linking Osiander to Cardinal Bellarmine, as most theoreticians stage this drama, it is clear that the great antagonist to such instrumentalism for Popper and for others is Galileo. And, as Ian Hacking puts it, 'Galileo is everybody's favourite hero—not only Chomsky and Weinberg but also Husserl.'[22] To say as has already been suggested that Galileo was not as radical or as ahead of his times as had been thought is to oppose the general conception of Galileo as a canonic scientific hero (or saint). This is the associative point MacIntyre makes (arguing in a different direction) when he speaks of Feyerabend's 'anarchism' as Emersonian in spirit, advocating 'not "Every man his own Jesus" but "Every man his own Galileo"'.[23] If Duhem is an instrumentalist, he also stands opposed to Galileo. And he cannot do otherwise. Duhem, with his claim that 'a law of physics is properly speaking neither true nor false' *(The Aim and Structure of Physical Theory),* is consequently one of the principal antagonists not only of Popper's realist-falsificationist view of physical theories but of all realist views of science.

Duhem's instrumentalism continues to be important for the present profile of the philosophy of science in the English-speaking world. For Duhem, the same physical law has a potentially different extension at different times owing to the historical development of these laws and their embodiment in experimental *praxis*. The meaning of a physical law is to be determined in the final analysis by the context of scientific practice and the scheme of related laws involved in determining the meaning of that law. This principle provides the basis for the underdeterminist perspective on the relationship between experimental evidence and theory and the constellation of related theories. Through the work of Quine and Davidson, this notion of underdeterminism led to the current position on theoretical indecidability that has done so much to bring analytic philosophy to a (theoretical) cul de sac if also, albeit indirectly, generating the current emphasis on the importance of experiment in discussions within analytic philosophy of science.

It is a testimony to the seminal character of the influence of both Duhem and Mach that it is today thought necessary to return to their philosophic understanding of scientific practice (as theory and *experiment/praxis*). This is not to say that they were in individual agreement among themselves but rather that each had distinct insights which similarly failed to be transmitted in subsequent debates. And the current urgency of an historical turn in the philosophy of science, clear since the work of Hanson, Feyerabend and Kuhn, is accordingly necessary largely if not only because of a correspondent refusal of history in mainline or analytic philosophy of science.

GASTON BACHELARD: SCIENTISM WITH A HUMAN FACE

Gaston Bachelard was born at Bar-sur-Aube in 1884. Bachelard's studies were conducted, as he himself was given to muse, under the sign of delay and he worked as a part-time mechanical technician for the French postal service until 1913 when he earned his *licence* in mathematics and science, becoming a teacher at the Collège of Bar-surAube. Upon earning his doctorate in 1927, he assumed the chair of philosophy at Dijon and was then called to the chair of the history and philosophy of science at the Sorbonne in 1940, where he remained until his retirement in 1954. He died in Paris in 1962.

Bachelard's philosophy of science is expressed as a 'dialectical rationalism' or 'dialectical naturalism'. Just as Duhem's anti-idealist conventionalism was read as conducive to the aims of materialism, although instrumentalist and thus inherently anti-realist, so Marxist authors such as Louis Althusser and Roy Bhaskar have read Bachelard's naturalism as a kind of dialectical materialism to be employed against ideological appropriations of science. Although the current interest in Bachelard's epistemology and consequently in his philosophy of science doubtless owes a good deal to Althusser, and without denigrating the value of Althusser's reading for Marxist or materialist epistemology, the Marxist reception of Bachelard's work and the word 'dialectic', if drawn exclusively from Althusser's programme, can be misleading (LeCourt). Still it should be emphasized that those working from Marxist perspectives have been far more assiduous in examining Bachelard's philosophy for its epistemic component than other traditionally analytic philosophers of science (Bhaskar).

Bachelard's emphasis is on a dialogical exchange, that is to say, a dialogue between the knower and the known, a dialogue between poetic and scientific discourse. This is not to be construed as inherently (or essentially related to) a dialogue between *poetry* proper and *science* proper. Instead the capital dialogical exchange is that between the scientist and the dreaming scientist himself:[24] the scientist and himself poetizing, or projecting (and thus 'dreaming' or effectively constituting or technically constructing) the world of scientific nature. Thus Bachelard wrote on the psychoanalysis of the history of the discovery of fire as a dialogue between psychoanalysis and that history to find *its* psychoanalysis metaphorically in (and of) the history of sexual desire. The metonymic association between the origin of fire (and electricity) and the fire (and electricity) of sexual passion points to a dialogue between image (the discovery of fire) and the human reflection or projection of that same discovery. Similarly, the philosophy of no, by which expression Bachelard seeks to characterize the openness of the scientific attitude, is a dialogical philosophy—or better a dialogical account—of scientific practice. To say that the scientist constitutes the phenomena, the objects of science, is not to describe a unilateral construction; rather the constitution is a formative, informative, reciprocal creation, a making of the scientist himself as much as a making (a projection or constitution) of the scientist's world. This exchange with the world of scientific or technical experience articulates the scientist's characteristic capacity for an anticipatory openness to scientific phenomena, an attitude ever open to possible revision upon

encountering a new phenomenon. Such a 'no' is then heuristic in function not destructive or eliminative: it describes what for Bachelard will be the enabling condition for the possibility of openness to (scientific) novelty. The scientist is thereby summoned to further innovative and creative efforts, reconstituting a new framework embracing the new experience.

Bachelard sought to go beyond phenomenology and regarded Husserl's own contributions as so many points of (dialectical) departure for Bachelard's own avowedly polemical reflections. Thus Bachelard could speak of the need for a 'phenomeno-technology' to reflect the engaged role of the human investigator and the world under investigation. Hermeneutically and phenomenologically sensitive authors have read this perspective as compatible with a hermeneutic phenomenology of (reading) scientific instrumentation.[25] But against such a tolerant syncretism of Bachelard's poetizing science and phenomenological hermeneutics of scientific culture, Bachelard's inherently antagonistic emphasis is more than clear in its original context. In the interest of and following upon the inspiration of science, Bachelard aims to *correct* phenomenology. Owing to the scientific phenomenology implicit in the doing of science, as Bachelard's philosophy of 'no', 'observation is always polemical; it either confirms or denies a prior thesis, a preexisting model, an observational protocol'. For Bachelard, philosophic reflection on science must be prepared to be instructed by science in practice. 'A truly scientific phenomenology is therefore essentially a phenomeno-technology' *(The New Scientific Spirit [6.54])*. The result of this perspective is not merely the banal pragmatism one might expect. Because Bachelard expects that the prime experience of science is to be a mathematical one, and that, as 'the mathematical tool affects the craftsman who uses it', it is not only safe to say that '*Homo mathematicus* is taking the place of *homo faber*', but that ultimately 'it is mathematics that opens new avenues to experience'. Close as this point of view is to Husserl, the gap remains and is widened by Husserl's sense of crisis, as a separation even more exacerbated by Heidegger's hermeneutic critique of technology along with the knowledge ideal of *mathesis,* or axiomatic certainty.

More negatively, resolutely committed as Bachelard was to the scientific and Enlightenment ideal disposition of a constitutional happiness or cheerfulness, Bachelard found the existentialist world-view particularly pernicious for it expressed what in his view was a false opposition between enquiring subject (poetizing poet or scientist—for they are or at least inherently can be considered the same) and world object (as created or as world to be known). Bachelard refused the distinction between the living subject and a dead or alien or meaningless world. The poetic world of human meaning was continuous with the scientific world, which for Bachelard bore the manifest imprint of the human projective imagination. Bachelard's positivism accordingly preserves the casual colloquial meaning of the word 'positive' as an optimistic outlook, or, in Bachelard's words, a 'happy' perspective. This affirmative and essentially scientistic humanism is expressed where Bachelard writes 'Science calls a world into being, not through some magic force, immanent in reality, but through a rational force immanent in the mind…. Scientific work makes rational entities real, in the full sense of the word' (*New Scientific Spirit* [6.54]).

Bachelard's work is extensively cited and has been the subject of numerous commentaries, less in the context of the philosophy of science than in principally literary

and philosophical discussions of Bachelard's poetics. Beyond anglophone continental philosophic interests, Bachelard's eclectic style of reading between literature and science has found significant hearings in France and Germany in part through the efforts of a tradition of literary theorists (as Barthes recounts). In (particularly French) history and philosophy of science, this reception is due to the influence of Bachelard's student, Georges Canguilhem, the historian of physiological science, and R.Cavailles. In this company, Michel Foucault may also be regarded as within Bachelard's intellectual sphere. But if Foucault's value may be traced to—better and more significantly, if here it can be argued that Foucault's value for science can only be understood in terms of—Bachelard's influence (cf. Tiles who prefaces her own study [6.83] by saying that her representation of Bachelard 'is a rational construct',[26] or Gutting who reads Bachelard and Canguilhem as background to Foucault, or Bhaskar who also prefers not to treat of Bachelard on his own, or on his own terms, but sets and thus inevitably defines Bachelard in opposition to Feyerabend), the question of the nature of the enduring significance of Bachelard's philosophy for the philosophy of science is more elusive. This difficulty is not a matter of the conflict between religion and modern scientific sensibility—as it was in Duhem's case—but is doubtless due to Bachelard's style. This is a style that is less esoteric than simply dated and rather specific to French literary culture, at least according to Jonathan Culler's plausible and sympathetic account. Culler implies that the lack of conceptual resonance among philosophers of science or philosophers proper in response to Bachelard's works (a limitation which is also shared by non-francophone literary theorists) is due to Bachelard's nineteenth-century style of rhetorical and imaginative reference. The style in question is one of diffuse allusion and allegory, like that of Jacques Lacan. In Culler's view, Bachelard's style is simply out of synch with current modes of expression and particularly unsuited for today's impatient styles of reading.[27] To the late twentieth-century reader's impatience may be added a fatal incapacity, that is an inability to appreciate the sense, to infer and so to understand the full value of Bachelard's allusions. An allusive, allegorical or metaphorical—in Bachelard's words *poetic*—style presumes and is necessarily dependent upon the reader's aptness for and familiarity with the conventions used.

The capacity to note such allusive resonances in Bachelard's work is essential both for readers of Bachelard's philosophy of science and for readers of his literary criticism. Accordingly, the literary theorist Ralph Smith notes that it is Bachelard's 'philosophy of science [which] must be understood in order to truly appreciate the full significance of his essays on the imagination and to assess properly his contribution to literary criticism'.[28] Where, for Bachelard, 'Science in fact creates philosophy' (*The New Scientific Spirit* [6.54]), any clear distinction between Bachelard's value for literary criticism and science must perforce be difficult to make. Still the lion's share of this attribution of value is represented by studies in literary criticism. Apart from Gutting's background reference to Bachelard's work in line with the philosophy of science, and Tiles's related discussions, Bachelard is better known for his literary contributions, in so far as Bachelard's emphasis on the imaginary continues to appeal to a distinctively French fascination with fantasy and the domains of reverie and poetic invention.

Mary McAllester Jones's recent study [6.76] employs the term 'subversive' to emphasize Bachelard's predilection for the literary and for the imagination not on the

terms of humanism but rather as 'unhinging' humanism.[29] This inverse, 'subverting' emphasis corresponds to the fashionable celebration of the postmodern but also testifies to the need to come to terms with scientism's recondite and irrecusable humanism. Citing Bachelard's claim that 'Man's being is an unfixed being. All expression unfixes him' (Bachelard in Jones [6.76], 193), Jones reads this 'unfixing' in her account of Bachelard's focus on the salutary *spiritual* value of challenge, dynamic flexibility and innovation. Thus, in Jones's expression of such an *unhinged* humanism, the movement or fluidity of articulation is paramount: 'Man is unfixed by language, not decentered' (Jones [6.76], 193).

I think it helpful to add that this openness, as a very literal flexibility, is akin to Paul Valéry's anti-Platonic celebration of the divinity that is not given negative or oblique testament, that is, not at all missed or failing, but which *speaks* precisely in our muteness in the presence of beauty.[30] Such an awe or expression of silence in the face of the beautiful rather than revealing an incapacity (such silence betrayed in the human inability to hold to a steady glance in the face of beauty proves the body's counter-divinity as Plato maintains) is the caesura, the glancing gaping that affirms and confirms, sees, sings and consecrates what is seen. In Bachelard's words with reference to Valéry, 'the temporal structure found in ambiguity can help us to intellectualize rhythms produced by sound…. We have come to realize that it is the idea that sings its song, that the complex interplay of ideas has its own particular tonality, a tonality that can call forth deep within us all a faint, soft murmuring' (*La Dialectique de la durée,* cited in Jones [6.76], p. 73). Silence thus testifies to the moving power or *dynamis* so important for Bachelard, who was of course a reader of Valéry's poetry and theory as well as a high-school teacher of chemistry and university professor of epistemology. For Bachelard's enduring aim was to show that the work of the scientist was not only comparable to that of the poet, but was in its own and full sense a poetics as well. And if, as noted, 'science creates philosophy', for Bachelard it will also be science that, most properly said and equal to any poetic discipline, creates poetry.

In the creative processes of poet and scientist, the play of thought echoes or responds to what is in each case. This is what Bachelard means by writing, 'Science calls a world into being, not through some magic force, immanent in reality, but through a rational force immanent in the mind.' And it is in this creative, reflective way that Bachelard claims that 'Science in fact creates philosophy'. But that is to say that philosophy is science reflecting on itself. The scientist is creator (poet) and philosopher, a modern Prometheus calling 'a world into being'. Here, the different senses evoked by the idea of a 'modern Prometheus' in an English literary context (Mary Shelley's *Frankenstein*) and a continental context (romanticized Titanism) are significant and testify to the difficulties inherent in assimilating such an elusive and allusive author as Bachelard.

A contemporary physicist and philosopher of science, and one who may be counted within the continental tradition, Bernard d'Espagnat, takes Bachelard's important references to Valéry a step further. For d'Espagnat, Valéry's notion of spiritual value expresses a mysticism more veiled than obvious in Valéry's contrast between spiritual and material(ist) domains. D'Espagnat suggests that the nuance to be grasped here is that between a spiritual life without God (atheist) and spiritual life of a human (here, to be fair to d'Espagnat, perhaps not necessarily a *humanist*) kind. The difference is again not

necessarily disjoint.

Yet the association with mysticism should perhaps only be emphasized in a limited way. Furthermore, for the sake of rigour, Bachelard's version of humanist scientism can be named a subversion of scientism only on the most fancifully esoteric level and that level is ambivalently problematic because of its insistent humanism. Bachelard's project must be conceived as a *subversive* humanism far more than a postmodernstyle subversion of humanism as Jones maintains. Such a subversive humanism must, it would seem, be rethought if it may not in the end be said to yield the absence of the subject. Which is of course only to say that a subversive humanism remains a humanism. This subtle humanism is such as d'Espagnat, for example, finds in Valéry. It is elusive because it entails the conjunction of mysticism and what d'Espagnat calls Valéry's 'positivism of principle'.[31] As the proponent of a mysticism which is simultaneously, coextensively in the human, the ambiguity of Valéry's position is rightfully his as poet. Bachelard's poetics of science offers an illumination of why a contemporary scientist such as d'Espagnat could turn to Valéry, a poet, as guide for 'thinking' science. Bachelard's philosophy of science represents (a position on) science as the high point of human culture (as its most profitable-productive and progressive expression). But this science-approbative perspective offers a valorization of science echoing not only Bachelard's well-rounded conservative cultural views but in uncanny resonance with the spirit of the 'two cultures' debate (and their interplay) popularized for the anglophone and traditional reader in the philosophy of science by C.P.Snow's essay *The Two Cultures*.

In Bachelard's as well as Snow's approach to the human achievement of science, science remains an ideal to be valued (and, post-Foucault, we can observe that this value is also the power of science, a power Nietzsche and Lacan would tell us which contributes to the Enlightenment role or reign of terror). Where Snow glamorizes science, Bachelard renders science a kind of poetizing and its products, its 'phenomeno-technologies', a kind of poetry. In effect, science becomes myth. But this does not resolve the opposition between *logos* and *mythos,* an opposition which has been traditional since the beginnings of Socratic philosophy. Since a glamorization of science is a part of our contemporary high-industrialist culture, Bachelard's mythification of science, as a poetizing venture, far from being a revolutionary coding (much less a double or subversive coding) only underlines the ruling mystique of science. In this supplanting of *mythos* by *logos, mythos* is not eliminated but absorbed by or subsumed under *logos*. *Mythos* becomes (is and as so named always was) a function of *logos*. With a cultural presumption exceeding Mach or Duhem, Bachelard asserts the very poetic function of science. On Bachelard's enthusiastic account, science as scientistically—which is also to say (for such is the force of the mythic-logical conversion) science as *poetically*—conceived truly *is* poetry at its best.

Bachelard's express identification of the *project* of scientific practice and method, in theory and experiment, where the scientist is taken to *constitute* the manifest entities (and not merely the image) of science (what Bachelard calls poetizing) inspired the structure of the sociological turn so decisive for the development of the new philosophy of science beyond the received hypothetico-deductive or reconstructivist view (Latour, Bloor, Woolgar). Literally constructed, the poetic project of the world of science is a suitable object for a sociology of knowledge and scientific practice or, in Bachelard's esoteric

coinage, a psychoanalysis of science.

THE HISTORY OF CONTINENTAL PHILOSOPHY OF SCIENCE

From the perspective of Anglo-American analytic-style philosophy, continental philosophy may be identified as the tradition of philosophy committed to thinking within the philosophic tradition, that is, committed to explicitly reconstituting the enduring value of the history of philosophy. For its part, analytic philosophy is not concerned with the history of philosophy although to be sure it is rooted in it. Nor is analytic philosophy, as defined by Müller and Halder, concerned with the traditional objects of philosophic inquiry such as *things* or *relations* or *events,* but rather with 'expressions, concepts, axioms, principles'.[32] On the basis of such a distinction between the objects of continental and analytic philosophic concern, Husserl's otherwise putatively realist 'To the things themselves!' articulates an interest that is not merely stylistically but constitutively antithetical to analytic philosophy.

Patrick A.Heelan characterizes continental philosophy according to two interests: '(1) its preoccupation with the problem of the 'constitution' of knowledge, and (2) the effect of the historical and cultural world context of science on the 'social constitution' of scientific knowledge'.[33] Although the word 'constitution' occurs twice in this definition, rather than focusing on the phenomenological account of such constitution, recent efforts to articulate continental philosophies of scientific theory and practice emphasize the interpretive turn to hermeneutics (Hiley, Bohman *et al.*). The hermeneutic turn is the interpretive turn taken by many analytic philosophers after Rorty, and in so far as this interpretive turn is necessarily an historical turn it is also, as mentioned above, one that is familiar to analytic philosophers of science after Kuhn. The interpretive and historic turn, which may be designated the hermeneutic turn, thus represents the most salient line of intersection between continental and analytic-style philosophy. But preliminary to any rigorous and significant expression of this intersection, as Rüdiger Bubner has demonstrated in a broader reflection on hermeneutics and critical theory, it is essential for the hermeneutic turn to be properly conceived in its technical and (that means) historical context.[34] This background critical context (and constellation of related interests) does not yet characterize the accepted path of received philosophy of science. Bubner's precision is of capital importance for the future of hermeneutic approaches to the philosophy of science. In recent historical studies of science (Hacking, Jardine, Crombie), a noteworthy attention is paid to the concept of the broadly hermeneutic rather than the specifically phenomenological philosophies of Husserl and Heidegger. Authors such as Gadamer and even Nietzsche may be invoked and references made to Ricoeur, but I think it important to consider the consequences entailed by Bubner's reservation that a genuine conversance with critical hermeneutics (in its theoretical and historical context) is often lacking.

What is more crucial than even this lack of interpretive and historical competency is the question of the advantage for the philosophy of science to be gained by taking the 'continental' turn, as it were, be that turn construed more narrowly as a historical turn or more radically as a hermeneutic turn. Would such a turn advance the fortunes of the

currently becalmed (post-Kuhnian, post-sociology of science and knowledge) philosophy of science? Long ago, Immanuel Kant observed that philosophy itself seemed almost not to progress at all if compared to the natural, formalizable or mathematical sciences. For Kant, in the first *Critique* and the *Prolegomena,* to express the difference between philosophy and science, where science shows clear signs of cumulative and accelerating development, philosophy, in contrast, appears dissolutely aporetic: without issue or advance, and without consensus, lacking even a unified perspective or standard for what would count as such advance. To date, analytic-style philosophy seeks to be true to the scientific standard for philosophic progress as implied by Kant's criticism, and seeks the kind of absolutist or cumulative understanding, including formal precision and consensus, which constitutes or at least approximates the professional mien of a scientific endeavour.

If the ideal of science remains the ideal of our modern era, and where science, echoing Kant's reference, is offered as the standard for philosophy itself, it seems patently obvious that only a *scientific* (here, analytic) project of understanding the project of science could command our interest, and analytic philosophy, given its rightful or proper distinction, should also exclude other styles as irrelevant. Thus, as we have seen, Mach, a scientist who was hence already affiliated with the (as he thought) superior thought-style, eschewed the title of philosopher. If science shows *concrete* or factual progress where philosophy manifests only moribund confusion or intestine bickering, science by contrast would appear to have the most progressive part.

But the history of science shows that even in science the idea of progress is a conceptual chestnut. As Kuhn has it, one era's idea of progress is the 'paradigmatic' error to be overthrown by the 'revolutions' of another generation. Even with a cumulative, pre-Kuhnian scheme of simple progress, the philosophy of science, failing to approximate that ideal, is more 'philosophical' (indeed to the extent of following Kant's aporetic account) than Mach's ideal science. The philosophy of science, even analytically construed, even modelled as it is on science, is still not a science as such. Nor is it a metascience: if the philosophy of science is to be a science of science, complete with *concrete* progress and visible results, it has not been very successful. Offering an array (with no end in sight) of logical accounts, analytic philosophy of science may explain and offer an understanding of the workings of science as it conceives them. It is at this formal juncture that an analogy with the practice of science must end. For where science has to do with actual events, whether theoretically construed or experimentally constituted, where science is predictive, and thus amenable to verification or refutation, where related theories and experimental tests may be expected to proliferate, the *philosophy* of science, in its project of explaining science, does not similarly test or check its explanations against the substance or 'fact' of actual science. Thus the shock of the historical, interpretive or hermeneutic, and sociological turns in the philosophy of science. Far from a critique of science as a fact, the philosophy of science begins with science as it finds it: as a fact, a given, and a given to be accepted on the scientist's own terms. Neither Mach nor Duhem would champion this perspective, precisely because of their commitment to the project of science. And Bachelard was too much a scientist himself despite his celebration of science to petrify it by treating it as an accomplished fact. Thus if the least demanding definition of the business of science as an explanation of what the world is, of the world as it is (truly, or really, or practically-pragmatically), is to 'save the

phenomena' on some level, either directly (observationally) or theoretically, the business of the philosophy of science (*qua,* pretended science of science) will need to do the same for science. But that means that the philosophy of science cannot, despite its scientistic ambitions, become a science because such an account belongs within the perspective of philosophy.

CONTINENTAL CURRENTS IN ANALYTIC-STYLE PHILOSOPHY OF SCIENCE

The concern of analytic philosophy is, as its name betrays, a concern with the logical analysis of language. Indeed, for the sake of this distinction, it should be said that analytic philosophy is committed to the dissolution (that is, literally, the analysis) of philosophic problems through their clarification. Once the traditional questions concerning things in the world, cause and effect or freedom are analysed in terms of their meaning and significance one finds that one has to do with a logical account or tractatus concerning the world (i.e., statements, claims and assertions).

The analytic tradition of the philosophy of science is marked by its attention to questions relating to the structure of scientific explanation and theory-making. If science is characterized by reciprocal theoretical and experimental activity, the philosophy of science in its analytic mode has shed more light on theory than on experiment. Conversely its disposition *vis-à-vis* experimental procedure is such that the very mention of historical studies whether by historians of science (Kuhn, Crombie) or by sociologists of science (Barnes, Shapin, Bloor, Latour, Woolgar, Knorr-Cetina) has had a disruptive effect on the analytic programme. For the analyst, historical studies are often characterized by attempts at normative historical reconstruction. Feyerabend's work offers an example of such reconstruction, where efforts to restore the sense and significance of Mach's contribution to the foundations of the philosophy of science should be seen as a logical fulfilment of Mach's appreciation of science as historically and normatively progressive.

Note that this criticism of analytic-style philosophy of science is not a complaint raised against analytic style philosophy of science from the side of continental philosophy. These criticisms have been offered in tandem with the development of the philosophy of science itself from the start, beginning with Mach and Duhem and offered as well in various styles of historical reflection by philosophers and historians of science across cultural boundaries, from Bachelard and Canguilhem to Hanson, Kuhn and Feyerabend. None of these, not excepting Bachelard and Canguilhem (or French philosophy of science today which remains as addicted to analytic as to continental approaches), may be named a typical continental philosopher.

Mach, Duhem and Bachelard along with a number of other scholars have argued that science itself is more critical, indeed more inherently 'hermeneutic', than philosophy. But this point too is problematic, and not only because of its counter-intuitive content—whereby science ends up with the virtue of being more hermeneutic than hermeneutics itself. It is overhasty to conclude as Mach for one would argue, with Duhem and Bachelard echoing him here, that scientists are the best judges of their own practice or

that science provides its own best philosophy.

Feyerabend has argued eloquently against this view in *Against Method* and his recent books. But we should not need Feyerabend's warnings that if science is not inherently a socially *responsible* enterprise, science is nevertheless neither the Moloch nor the redeemer of culture and it *is* as a practical matter of funding in fact socially *responsive*.[35] We do need to add, that for Feyerabend's programme of taking responsibility for getting 'science' to respond to social interests and needs, that if one is not to sink into the platitudes of civic virtue, now more than Nietzsche could have imagined, we desperately need a critique of critique, a critique of reason, of truth, of morality.

If the analytic philosophic perspective represents the notion that (natural and objective) science is 'mankind's most successful truth enterprise', as Heelan puts it, the continental approach rejects the Whiggish implications of this ideal. However, this is a subtle point for it must again be emphasized that today there is no approach to the philosophy of science, analytic or otherwise, which would advocate an unreconstructedly Whiggish ideal. Yet if the perspective of a continental approach to the philosophy of science is inherently problematic owing to a perception of its views as 'anti-science', read off from its explicit rejection of scientific knowledge as a 'privileged kind', the pluralism of continental philosophy recommends a reconsideration. Such a review of continental prospects for the philosophy of science is under way.

This phenomenological tradition begins with Husserl's project of grounding mathematics and physics begun in his work on arithmetic and continued in his *Logical Investigations* and *Ideas*. Related to the Husserlian tradition in turn is Merleau-Ponty's *The Primacy of Perception.* Husserl's interests grew out of the same tradition as and to that extent matched analytic philosophy (Cobb-Stevens). Considering the common origins of analytic and continental philosophy as a response (variously expressed in Husserl and Frege) to the psychologism of Meinong and Brentano, one might propose, as Michael Dummett has done, that a basic standard for bridging the continental-analytic divide should be a scholarly conversance with *both* Husserl and Frege. In this way, Hugo Dingler, a positivist and in that measure an analytic philosophic thinker, may also be productively counted as one of Husserl's students, indeed as a student who memorialized the value of his teacher's influence (Gethmann, Dingler). Recent reviews of the history of the Vienna circle point to a revaluation of the historical relationship between phenomenology and logical positivism. In line with this analytic/continental connection, Ströker, Orth, Gethmann and Haller may be read as offering comprehensive discussions of the phenomenological tradition beginning with Husserl, while Gethmann in particular stresses the development of that tradition in Lorenzen and the Erlanger school and its further development and the continuation of constructivist themes in evolutionary epistemology (Wuketis, Löw, Maturana). According to Gethmann, beyond Husserl's transcendent phenomenology, Heidegger's specific brand of hermeneutic phenomenology may be counted as a indirect influence on the development of the Erlanger school. If Foucault is included, this line of association running from Husserl to Heidegger and beyond is more obviously seen to resonate with the Edinburgh school of strong sociology of science (Rouse, Latour).

Joseph Kockelmans defends as proto-analytic the realist perspective of hermeneutic continental approaches to the philosophy of science. For Kockelmans, a hermeneutic

philosophy of science requires a 'new conception' of truth understood in Heideggerian terms as *alētheic* (truth as unconcealment), *horizonal* or, in Nietzsche's terms, *perspectival* truth (Kockelmans, Heidegger, Gadamer, Babich). But where Kockelmans's concern is meaning, his reading of truth and science is closer to a Fregean conception of *Sinn* (sense meaning) and to the traditional Diltheyan *Lebenswelt* (life-world), articulated in terms of a Gadamerian hermeneutics than to the later Heidegger's conception of truth and ambiguity.

Patrick Heelan's interest remains true to the formal constitutive (eidetic, transcendental, and genetic) phenomenology that is Husserl's project to found philosophy as a rigorous science and not just with respect to the so-called 'crisis' of his later work. Heelan's hermeneutic phenomenology expresses a realism which he calls a *horizonal realism,* articulating the basis for a phenomenology of experiment to be integrated with the theoretical expression of science. Heelan's phenomenology holds with Husserl's eidetic project the possibility of approximating the essence of a scientific object through successive profiles. The hermeneutic dimension reflects the necessity for considering the historical, social and disciplinary circumstance of the researcher. Theoretical descriptions denominate the experimental profiles that would be perceived under standard laboratory conditions and, with a hermeneutic of experimental work, become truly descriptive of what is eidetically perceived in the laboratory. Heelan's perspective accords with strong or robust realist readings of experimental science, but his is more promising than most for with a hermeneutic phenomenological expression the realist perspective becomes a matter of perception not faith.

In current English-language publications, the foremost representatives of so-called 'continental' approaches to the philosophy of science in addition to Heelan and Kockelmans include Theodore Kisiel and Thomas Seebohm. Older continental scholars seem rather more concerned with the special problems of phenomenology (intuition and formal logic, the meaning of transcendence, etc.) rather than with questions specific to the philosophy of science, while younger scholars read the value of Husserl's and Heidegger's thought with respect to science rather more historically and less theoretically. Recent studies (Gethmann, Orth, Harvey, Rouse, Crease) by contrast tend to argue for the historical influence upon rather than the current value of phenomenology and hermeneutic reconceptualizations of the expression of the philosophy of science.

In sum, this means that the work of Heelan, Kockelmans, Kisiel, Seebohm (all continental scholars, most originally of geographically continental nationality but working in the traditionally analytic academic world of United States philosophy of science), etc., must be seen as rather singular representatives of the philosophical development and application of the phenomenological and hermeneutic traditions towards an understanding of science including the natural sciences. And given the factually analytic profile of professional philosophy of science, by far the most influential contributions to the imperative value of a continental turn to historical and hermeneutic expressions of the philosophy of science must be said to have come from traditional analytic philosophers of science, complementing where not directly acknowledging the work of Heelan *et al*. This is not due to the greater perspicacity of scholars in the analytic tradition: it is only a function of its paradigmatic (and professional) dominance. Thus, for example, Hacking's recent work on statistics in *The Taming of Chance* and his recent

articles is characterized by more than a historical turn but a turn that must be properly and fully named (although Hacking does not employ the term) hermeneutic. And this same reference to hermeneutics is implicit when not explicit in many recent historical studies of science (Jardine, Crombie). What is more, in the turn to the social (in old-fashioned terms, to the *life-world*) dimensions of science inspired by the sociology of science and knowledge (Hiley *et al.,* Fuller, Latour, McMullin, Shapin/Scheffler), a new fusion of styles in the philosophy of science is emerging. If philosophy of science may not be said to be returning to its historical continental roots in all these revolutions, a review of these roots cannot but be salutary for the life of the broader discipline, for the range of styles, the plurality, of philosophies of science.

NOTES

1 The topic of the nature of a continental approach to the philosophy of science is almost necessarily esoteric rather than general. The intersection of continental thought and the philosophy of science is far from well defined in professional philosophy. Indeed, the focus on Mach, Duhem and Bachelard may even appear tendentious for these authors might well be represented as antecedent figures within traditional analytic philosophy of science. In fact they serve this antecedent function for both analytic and continental expressions of the philosophy of science. Hence the issues raised in this chapter correspond to the history of continental philosophy and the philosophy of science, their intersection, and the current state of research. As this last profile is constantly in flux, a more detailed bibliography has been included to indicate this ferment and to benefit further research.

9 Harré (note 1), p. 29.

10 M.Tiles [6.245], 227.

11 Blackmore cites Hans Kleinpeter's 1912 letter to Mach, reporting that 'Nietzsche read one of your essays in a scientific journal and spoke very favourably about it' ([6.8], 123). And according to Alwin Mittasch, Mach himself sent a copy of one of his articles to Nietzsche bearing the hand-written dedication 'Für Herrn Prof. Dr. Nietzsche hochachtungsvoll Ernst Mach' (Mittasch [6.151], 367). Mach's views correspond to Nietzsche's refusal to distinguish between the organic and the inorganic world as discontinuous (indeed, as opposed). For Nietzsche the living and the dead are representations of a non-discontinuous

order.

12 It goes without saying that positivism has an almost uniformly negative connotation. This negative evaluation is not unique to our own times. F.Ringer notes that in the German universities between the 1890s and the 1930s, during the Weimar period, 'the label "positivist" was almost invariably used in a deroga-tory sense' ('The Origins of Mannheim's Sociology of Knowledge', in McMullin [6.202], 55). This parallel with contemporary negative connotations of positivism extended to a critique that similarly accords with the corrective turns to the historical, the interpretive or hermeneutic and the social. For Ringer, the criticism of positivism entailed its own inherent ideology: 'positivism was seen as a kind of intellectual acid, a potentially disastrous dissolvent of wholistic concepts, traditional beliefs, and socially integrative certainties. To "overcome" the problems raised by specialization and positivism alike…there was an urgent need for a revitalization of philosophical idealism that would also reinstate *Wissenschaft* as a ground for an integral and partly normative *Weltanschauung*.'

13 I.Hacking, '"Style" for Historians and Philosophers', *Studies in the History and Philosophy of Science,* 23:1(1992):1–20 (12).

14 Berthelot, Duhem scholars seem pleased to observe, is himself today very nearly forgotten and certainly more obscure than Duhem.

15 The issue is a socially and historically complicated one. For background information on this topic, see chapter 6 of M.J.Nye [6.51]. For a fuller discussion of the particular circumstances of Hélène Duhem's efforts on behalf of her father's unpublished work, see R.N.D.Martin [6.50],

16 Parisians—and New Yorkers—will understand the profound implications of such a circumstance. Although Duhem was characterized by his Bordeaux contemporaries as testy ('violence himself'), it is not hard to imagine this perception a result of a provincial point of view.

17 Today we might understand this perspective as a reaction against *scientism,* and it is still represented by thinkers such as Jacques Ellul and René Dubos. For a discussion of the French intellectual landscape with respect to the historical features of scientific dogma and religious belief including a discussion of Dubos' situation regarded within such a vista, see H.W.Paul [6.52].

CHAPTER 7
Philosophies of Marxism

Lenin, Lukács, Gramsci, Althusser

Michael Kelly

INTRODUCTION

Marxist philosophy can be seen as a struggle with Hegel or a struggle with capitalism, that is, as an intellectual or a political movement. Neither of these views can be very readily reduced to the other, but nor can they be entirely separated. It is difficult to deal with Marxism in terms of a particular discipline when so much of it sprawls awkwardly across the lines which delineate disciplinary boundaries within the English-speaking institutions of knowledge. The attempt here to approach it within a philosophical context can scarcely avoid transgressing that context and introducing material which, in a narrow definition of philosophy, may be thought out of place. To consider Marxism at all, philosophy may need to consider itself a more commodious enterprise.

A history of Marxist philosophy cannot be innocent. The Marxist tradition includes histories of philosophy and philosophies of history. It also includes notoriously conflicting accounts of the nature and status of both history and philosophy. Nor is there any better agreement among non-Marxist thinkers on the nature and status of Marxist philosophy. A study of its history must enter a fiercely contested field of combat, where, more than in any other philosophical tradition, the struggle is waged not only in the intellectual realm but also in the social and geopolitical arenas. The context in which this study is written, in the turbulent and uncertain aftermath of the collapse of communist regimes throughout Europe, carries its quantum of intellectual risk, and confers a certain untimeliness on what is to be said.

Far from being a *philosophia perennis,* Marxist philosophy is in constant mutation, spurred not only by the shifting contours of its environment but also by the changing problems and purposes of its practitioners. With the passage of time, there has grown up an increasing multiplicity of re-interpretations of canonical texts and commentaries, several divergent accounts of who the founder (or founders) were, which of their writings may be relied on and which subsequent commentators should be consulted. In many cases, such issues have been the occasion of bitter controversy, and several schools of Marxist thought have vigorously claimed to possess the only authentic version. Some have, for a time at least, been willing and able to support that claim with judicial or even military coercion. An initial question is therefore that of identity: in what sense can a substantive Marxist philosophy be coherently defined across the diversity of its forms? Eschewing orthodoxies, the present study will be content with a looser understanding of the Marxist tradition as a family of movements, connected in complex and often

conflictual relationships. In such a brief span as this chapter, it will not be possible to examine more than a few moments in the tradition, and the main lines of their interrelation. Such a broad approach to Marxism carries a price. In particular, it cannot do more than gesture at the coherence and breadth of view which some versions of Marxism have achieved, and which some, but not all, Marxists have regarded as a major strength and achievement.

A closely related issue is what status to accord to philosophy within Marxism. Invariably, this refers back to the relationship between Marx and Hegel. Marx's much repeated distinction between Hegel's system (castigated as the idealist shell) and his method (lauded as the rational kernel) has given rise to deeply conflicting interpretations. Whereas some have argued that Marxism continues the Hegelian project of providing a general philosophical framework which unifies the entire field of human knowledge, others have contended that Marx's signal achievement was to abandon philosophy, having exposed its ambitions as illusory. There are many other positions between these two poles. Without invoking an easy dialectical supersession of these terms, the present study grasps the nettle at least to the extent of accepting that there is a field of discourse within Marxism which must be recognized as philosophical, even when (perhaps especially when) it purports to announce the end of philosophy.

At the heart of the problem is the relation between theory and practice. The starting point lies in the major insight of Marxist thought that in addition to understanding or interpreting the world it should seek to change it. Implied in this notion is the view that in the first instance thought is a product of human social activity and that in the second instance it contributes to producing or shaping the future course of that activity. Applied to philosophy specifically, it suggests that philosophers who refrain from seeking change are by default helping to maintain the existing social order. It may then be inferred that philosophers who declare themselves as Marxist (or vice versa) are engaged, through their philosophy, in a project of social change. The consequences of such an inference for Marxist philosophers personally have at different times and places ranged from exile, torture and execution to celebrity, fame and fortune: more often the former than the latter. The shadow of the philosopher-king also looms in the important historical figures who inhabit the pantheon of Marxist philosophy, including Lenin, Stalin and Mao Tse-tung in their day. Their example compounds the tension between theory and practice in urging Marxist political figures to exercise leadership in philosophy and philosophers to don the mantle of statecraft: a wider gulf to bridge within some cultures than within others.

Karl Marx's own discomfort on the interface between his theoretical and political responsibilities was summed up in his reaction to French 'Marxists', whose work prompted his much-quoted comment that 'I am not a Marxist'. While it may be rash to place too much weight on this *boutade,* it usefully illustrates the problematic relationship between Marxist philosophy and an individual author. Perhaps more than elsewhere, there are visible limits on the extent to which an author can, or would wish to, claim ownership of the texts or ideas ascribed to him or her. If Marx was led to disown his self-appointed disciples during his lifetime, it would be prudent not to assume too close a correspondence between his or other thinkers' writings and the positions with which they are usually associated. Such prudence would be encouraged by the common phenomenon in Marxism of texts coming to exercise influence only long after they were written and in

quite different circumstances from those in which they were produced. This is eminently true of major works of Marx, Lenin, Gramsci and Lukács. A thinker is often brandished as a banner, designating a particular view which may or may not be found explicitly in his or her work. Frequently, by a process of displacement, a thinker or even a philosophical concept will also come to function as a coded reference to a political position or programme, which cannot be directly addressed. An author or idea is in this respect primarily a signifier, whose meaning is closely dependent on the context of its utterance. They can in this way be emptied of meaning, though it is also common for them to become supersaturated with meaning, when accumulated layers of commentary effectively come to bar access to a heavily glossed text.

Marxist philosophy is largely inextricable from the groups and movements for which it has been formulated or which have adopted it as a theoretical approach likely to promote the achievement of their political purposes and programmes. Among them have been the labour and trade union movements, the political parties of the left, the movements for national self-determination and the states and regimes which under one guise or another have espoused Marxism. Institutionalization of this kind has several effects which often differentiate Marxist philosophy from other philosophies. One which is rarely remarked upon is that the channels of its communication are frequently those of a sponsoring organization, whether a political paper or journal, a political training programme or a publishing house with a recognizable political or social complexion. Not infrequently, work of Marxist inspiration has been excluded from the channels available to professional philosophy. Marxist texts are always characterized by high levels of intertextuality, such that their importance is often only grasped by a reader who is familiar with other canonical or contemporary texts from which they are specifically distinguished. Another distinguishing feature is the frequent effort to express Marxist ideas in a way which is sufficiently simple and systematic to be widely understood and applied, particularly by a non-specialist readership. Allied to this is the degree of constraint under which work is produced, ranging from standard formats and house styles to varying degrees of editorial intervention and collective authorship. No doubt this is inseparable from the effect institutions have of vesting philosophy with authority beyond the intrinsic merit of rational discussion.

There remains one final question for the present historical study: what is the object of study? Is it a history of philosophers, however defined, or of ideas, or of intellectual movements? And what criterion of selection and ordering is to be applied in the face of a daunting abundance of material? The close dependence of Marxist philosophy on the material conditions of its production and its reception suggests that it should be approached as a history of ideas, though the confines of space dictate that it will here be examined most often in terms of an individual philosopher. But while ideas and philosophers do have individual and collective histories, their history is not wholly their own. Concepts, propositions or arguments appear, change and disappear at times and in places that can be charted, but their development cannot be adequately understood in isolation from other historical processes, which provide both the conditions of intelligibility and the main motive force for change. Ideas, in other words, draw their life and strength more from social than from logical relations, though in the present study the social context can be only lightly sketched.

If ideas do not entirely have their own history, then they may best be approached through entities which do have their own history. From this perspective, it is clear that countries, or regions, offer the most manageable historical framework. Countries certainly do have their own history, and it may even be argued that having a history is what makes a country a country. The identity of a modern nation is closely bound up with the construction, by itself and others, of a historical narrative in which it figures as the subject. Philosophy is one of the cultural forms through which a nation represents itself, articulating a general statement of its own identity and its history, especially in relation to the acquisition of state power. Marxist philosophy has for most of the twentieth century been a major participant in defining and representing this process, and the remainder of this chapter will therefore be structured in terms of national and regional Marxist philosophical movements.

SOVIET MARXISM

The Soviet Union was the first country to adopt Marxism as an official philosophy. Supported by resources of the state and the prestige of the October Revolution, Soviet Marxism was for most of the twentieth century the dominant version of Marxist philosophy in the world. Its domination was never complete, of course, and much of the debate among Marxist philosophers has been directed towards attacking or defending all or part of the Soviet synthesis.

Towards the end of the nineteenth century, Russian socialists discovered Marxist ideas, and, largely under the direction of George Valentinov Plekhanov (1856–1918), elaborated them into a schematic and all-embracing philosophy. Plekhanov's major work, *The Development of the Monist View of History* (1895) became both an authoritative statement and a model for later Soviet approaches to Marxism. He critically analysed several currents of previous European philosophy, drawing out the strengths and limitations of their thought as a preparation for the resolution of their problems in the Marxist materialist conception of history. The materialism of the eighteenth-century French Enlightenment, the conception of history of nineteenth-century French historians, the French Utopian socialists' concept of society and the dialectical philosophy of the German idealists were each examined and found to be useful but flawed. He then expounded Marx's solutions, based on Engels's short accounts of his own and Marx's philosophy, which Plekhanov characterized as a 'modern dialectical materialism', thus coining the term which later became the generic title for official Soviet Marxism. He laid a particularly strong emphasis on the determining role played by the economic base of society, as against the political, legal and ideological superstructures, which he saw as merely a function of the base, facilitating or impeding economic developments.

Without dwelling on the detail of his interpretation, it may be noted that Plekhanov firmly established the practice of approaching Marxism through the exegesis of passages from Marx and Engels, confirming a scriptural tradition in which texts are the authoritative source of truth. He also approached Marxism through the intellectual history of its antecedents, with several important consequences. In the first instance, it situated Marxism in the mainstream of European thought, with all the intellectual prestige

attaching to it, particularly among the Francophile Russian intelligentsia. Second, it suggested that, within this tradition, Marxism appears as a modern and therefore better solution to long-running problems, the very example of human progress. Third, it confirmed the contestatory and polemical character of Marxism, which is almost defined by its conflict with other schools of thought. These characteristics were amplified over the years, as Plekhanov became the catechist of Russian Marxism. Even though he became a leader of the Mensheviks from 1903, his philosophical writings were warmly endorsed by Lenin, and his influence continued for several years after the Revolution and his own death in 1918.

Lenin's main philosophical work is *Materialism and Empiriocriticism* (1908). In it he attacked what he considered to be idealist deviations in the theory of knowledge, canvassed by leading intellectuals within the Marxist movement, among them Plekhanov, who saw convergences with religious thought. Lenin contested the view that discoveries in modern physics, challenging Newtonian mechanics, lent support to these 'revisionist' tendencies. Apart from the reiteration of classical statements of principle drawn from Engels, the major impact of the work was to reinforce the polemical mode in which Russian Marxist philosophy was increasingly couched, with the invective and stigmatizing labels which were more common in political discourse. Lenin also published a number of short popularizing accounts of Marxism, including an essay, *The Three Sources and Three Component Parts of Marxism* (1913), which identified the founding triad of Marxism as German philosophy, English economics and French politics, each superseded by Marx's theoretical advances.

The importance of these works is primarily that they were written by the leader of the revolutionary movement which took power in 1917, and founder of the Soviet state. In this capacity, they underwent the same canonization as Lenin himself, after his death in 1924. Used to support several sides in the philosophical debates of the 1920s, they achieved the status of scripture when, in the early 1930s, Joseph Stalin declared Lenin to have made such a significant advance in Marxism that it was henceforth to be known as Marxism-Leninism. The sanctification was selective, however. In particular, Lenin's notes on his enthusiastic reading of Hegel, published in 1929, did not attract Stalin's approval.

The process by which Marxism-Leninism became the state philo-sophy of the Soviet Union was marked by bitter controversies, particularly among the professional philosophers who vied with one another to secure the support of Stalin. The groundwork of Marxism-Leninism was laid in the codification of historical materialism by Nikolai Ivanovitch Bukharin (1888–1938), in his manual *The Theory of Historical Materialism* (1921). It sparked an intense debate, much of it conducted in the pages, and editorial premises, of the leading philosophical journal *Pod znamenem marksizma* ('Under the banner of Marxism'—1922–44). On one side, the 'mechanists' (Skvortsov-Stepanov, Timiryazev and others) held, with Bukharin, that Marxism now had no need of philosophy since it had advanced to the stage of scientific knowledge. Consequently there was no place for philosophers and ideologists to intervene in matters of natural science.

On the other side, the 'dialecticians' (Deborin, Tymyansky, Sten and others) argued, in the tradition of Plekhanov, that Marxist philosophy was increasingly needed to generalize, unify and direct enquiry in all areas of knowledge, as a 'science of sciences'.

The debate was concluded in 1929 when Bukharin's fall into political disfavour took the mechanists with him. The dialecticians' victory was, however, shortlived. Their general position passed into orthodoxy, but they themselves were criticized by a new generation of 'bolshevizing' philosophers who accused them of overestimating Plekhanov at the expense of Lenin, and of unspecified links with Trotsky (who had in fact generally been reluctant to pronounce on philosophical matters).

At the centre of these debates was the question of authority, which fell into two parts. First, what authority did philosophy have to direct activity in other areas of society, especially the strategic areas of science and technology? The answer to this was that it had complete authority to legislate and pronounce: Marxist philosophy was fundamental to the successful construction of socialism, both in one country and worldwide. Second, what authority is philosophy itself subject to? The answer to this is that it was subject not to some internal philosophical principle or tradition but to the interests of the working class, represented by the Communist Party, embodied in its General Secretary, Stalin, whose authority was derived from Lenin. The specific contribution of Lenin to Marxism was in turn declared to be his championing of partisanship in philosophy, interpreted ultimately as the obligation of submission to the Party. This was the point at which Marxism-Leninism assumed the position of official state philosophy.

The 1930s were a period during which Stalin extended his power over the whole of Soviet life, and over the expanding communist movement throughout the world. Codification and 'bolshevization' went hand in hand under the banner of Marxism-Leninism, and reached their apogee in the era of the great purges with the publication in 1938 of the definitive Stalinist manual, *History of the Communist Party of the Soviet Union (Bolsheviks), A Short Course.* One chapter of the *Short Course,* credited to Stalin himself, laid out in simple schematic form the basic dogma of dialectical and historical materialism. The four principle features of dialectics, as opposed to metaphysics, are listed as interconnection, change, qualitative leaps and contradiction, while the three features of materialism, as opposed to idealism, stipulate that the world is material, exists independently of mind, and is knowable. This dialectical materialism is the guiding star of the party of the proletariat and when applied to the study of history it yields historical materialism. This recognizes that spiritual life (including ideas and institutions) is a reflection of economic production, and that the determining force in historical development is the mode of production, composed of forces of production and relations of production. Five types of productive (i.e. property) relations have existed: primitive communal, slave, feudal, capitalist and socialist, and the transitions between them have always occurred through revolutions triggered by the faster progress of productive forces (instruments, people, skill) than their associated relations.

The authority of the *Short Course,* assisted by its blunt clarity, channelled Marxist philosophy into a narrow and dogmatic orthodoxy, which held absolute sway in the Soviet Union and in world communism until after Stalin's death. Since that time it has been the implicit reference point of much of Marxist debate, even (perhaps especially) when Stalinism is most vehemently denounced. Soviet dogmatism was given a further twist in the early days of the Cold War when, under the direction of Andrei Zhdanov, culture, including philosophy, was relentlessly confined to the defence and illustration of Soviet Marxist preeminence in all things. This included strong discouragement of interest

in non-Marxist philosophy, even where, as with Hegel, it had strong connections with Marxism, and even extending to Marx's own noncanonical writings, particularly the Paris Manuscripts of 1844.

After the death of Stalin in 1953, and his denunciation by Krushchev at the 20th Congress of the Soviet Communist Party in 1956, the rigidly dogmatic approach began to ease. But an indelible pattern was set, which no amount of destalinization could remove. The authority of the state, the primacy of the party, the obligatory teaching of Marxism-Leninism at all stages of the Soviet education system and a strongly hierarchical academic establishment, all served to maintain the social and intellectual structure of Soviet Marxism largely unchanged. The Stalinist 'Vulgate' developed into an elaborate scholastic system, in which controversies might rage over the interpretation of a particular passage of the canon, or over the status of a particular doctrine. A good example was the successful campaign to rehabilitate the negation of the negation, omitted by Stalin from the *Short Course,* as one of the universal dialectical laws of development.

Paradoxically, the very close identification of Marxism-Leninism with the state and party also largely insulated it from developments which took place elsewhere in Marxist philosophy. The logic was simple: if a foreign thinker was not a member of a communist party, he or she was not an authentic Marxist, and could be recognized only as some form of renegade or deviant from Marxism; conversely, if he or she was a party member, his or her work could not be publicly discussed without infringing the principle of non-interference in the affairs of a fraternal party. The result was inevitably a thriving underground preoccupation with foreign Marxist philosophers, and with major non-Marxist philosophers. The resulting gulf between the public and private face of Soviet Marxism rendered it extremely friable under pressure of events. Marxism-Leninism in the USSR's eastern European satellites, and in pro-Soviet communist movements elsewhere, was clearly marked as a coded acceptance of Russian domination, political or ideological. In those parties which espoused the Eurocommunist line in the 1970s, it was symbolically rejected, while in many others it was discreetly abandoned. In any event, it had no independent strength on which to draw, and when the state and party which sponsored it collapsed at the beginning of the 1990s, Soviet Marxism effectively came to an end. Since it has been the focus and archetype of Marxism for most of the twentieth century, it remains to be seen whether its demise will also prove to be the end of Marxism as such.

The Chinese variant of Stalinist Marxism has also been influential. Chinese communism developed two main currents of philosophy, one being the orthodox Marxism-Leninism of the *Short Course,* introduced by Moscow-trained intellectuals and promoted by the Comintern, the Third or Communist International (1919–43) founded by Lenin to direct the policy and activities of Communist parties worldwide. The other current was an adaptation of the first by intellectuals based in the revolutionary headquarters at Yenan during the late 1930s, of whom the most successful was Mao Tse-tung (1893–1976). Apart from a much greater emphasis on the role of the peasantry, Mao developed a classification of contradictions in terms of whether they were antagonistic or non-antagonistic in nature, primary or secondary in the specific context, and what their primary and secondary aspects were. He argued that contradictions and their aspects could in certain circumstances pass from one type to another, particularly when they were handled correctly in the practice of the revolutionary party.

With the success of the Chinese revolution in 1948, and particularly after the death of Stalin, Mao was increasingly presented as a second Lenin, and Peking as an alternative to Moscow in the leadership of the world communist movement. During the 1960s, most countries witnessed the rise of Maoist communist movements, which in western Europe were small, but particularly successful in student circles. They were particularly influenced by the events of the Cultural Revolution, during which the 'little red book' of *Quotations from Chairman Mao Tse-tung* elevated his neo-Stalinism to cult status, condensing the official philosophy, renamed Marxism-Leninism-Mao-Tse-tung Thought, into all-purpose gobbets and slogans. From this apotheosis, Chinese communism returned from an internationalist to a nationalist Marxism-Leninism, and for a time during the 1980s began to allow the expression of humanist forms of Marxism associated with Lukács and Gramsci. Whether and how soon Chinese communism will incur a fate comparable to its Soviet counterpart can only be a matter of speculation, but it is clear that its influence on Marxist philosophy elsewhere largely ceased in the mid-1970s.

CENTRAL EUROPEAN MARXISM

In the early years after the First World War, before root and branch bolshevization had set them all marching to the rhythm of Moscow, there was still a flourishing culture of philosophical debate among central European Marxists. To a large extent this was conducted in the German-speaking circles which had been the intellectual centre of gravity of pre-Bolshevik Marxism. Pervaded by the humanism of the Second International, the organization which brought together the social-democratic and labour parties of Europe (1889–1914), and oriented toward a respect for intellectual and cultural values, it was blotted out by triumphant Marxism-Leninism and lay largely ignored until the post-Stalinist era of the 1960s. At that stage it was rediscovered in the writings of Korsch, Lukács, Benjamin, Bloch and others, and given widespread currency, largely by movements opposed to the dominant communist orthodoxy.

Several attempts have been made to construct an alternative tradition by aggregating these writers with the Frankfurt school, with Italian Marxists, and with French writers as diverse as Althusser and Sartre, to create a 'western Marxism'. Such has been the project of the British *New Left Review,* which has done a great deal to create an appropriate canon of texts in English, and has rendered accessible a broad range of non-Soviet Marxist theorists. None the less, the notion of 'western Marxism', coined in the mid-1950s by Maurice Merleau-Ponty, loses historical coherence as soon as it is extended beyond the germanophone debates of the interwar period. For this reason, it is more helpful to consider the diverse central European writers withouthaving to wrestle them into an artificial unanimity with each other and with writers from other intellectual and political traditions.

Undoubtedly, the giant among these philosophers is Georg (György) Lukács (1885–1971). Born in Budapest to a wealthy and cultured family, and educated in the universities of Germany and the Austro-Hungarian Empire, he wrote with equal facility in German and Hungarian, and played a significant role in the political history of Hungary and of the international communist movement, as well as being the central

figure in major literary and philosophical debates. Brought up in the German philosophical tradition of Kant, Dilthey and Simmel, he came to espouse Marxism via Max Weber and then Hegel, whose thought exercised an enduring fascination for him. A leading figure of the leftist faction in the Hungarian Communist Party during the turbulent events of 1919–20, Lukács developed an interpretation of Marxism sharply at odds with the dialectical materialism which gained ascendancy in Moscow. Through most of his career he was the target of repeated attacks on his 'revisionist' positions, despite his efforts at different times to assert his own orthodoxy. There has been considerable discussion as to whether Lukács's philosophical positions can be directly correlated with his political shift towards a conciliatory attitude to the non-communist left. But since his political sympathies were in many respects close to Bukharin, whose philosophy he opposed, it would be rash to draw any reductive conclusions.

Undoubtedly Lukács's major work is his collection of essays *History and Class Consciousness,* published in 1923. It was the focus for controversy in the years following its publication, and again at the beginning of the Cold War. It was widely circulated in French translation in the 1960s, before Lukács approved its reappearance in German and English in 1967. The basic thrust of the book was to relocate Marx firmly in the tradition of Hegel, and to draw out the Hegelian concepts which Marx had sought to refashion. In the first essay ('What is orthodox Marxism?') Lukács argues that Marx had adopted the progressive part of the Hegelian method, namely the dialectic, setting it against the mythologizing remnants of 'eternal values' which Hegel himself had been struggling against. In this sense, Marx was directing against Hegel the very criticism that Hegel had levelled against Kant and Fichte, that they immortalized particular moments of abstract reflection at the expense of an awareness of process, concrete totality, dialectics and history. Hegel, he argued, had been unable to progress from the level of abstractions to a perception of the real driving forces of history, and it had been Marx's originality to discover these forces.

Perhaps the most influential essay in the book, entitled 'Reification and the consciousness of the proletariat', launched the interpretation of Marxism as a theory of alienation, remarkably antici-pating the argument of Marx's Paris Manuscripts of 1844, which had not yet been brought to light. Lukács highlighted the exchangeable commodity as the basic unit of capitalist economies, and the fetishism of commodities as an inevitable consequence, leading people to neglect the human content of activity in favour of its quantifiable exchange value. He argued that it was a logical necessity for the development of capitalism that all relations must eventually be reduced to the structure of commodity-exchange. This process of reification led, he thought, to all aspects of life being calculated and quantified, alienating the individuality of both people and things. Carried to its conclusion, it also stamped its imprint on human consciousness and reified the most intimate areas of human relations and the most rigorous of scientific investigations. Within bourgeois society there was clearly no prospect of a radical escape from the ravages of reification. The only hope of a solution was to transform philosophy into *praxis,* a practical orientation of thought and consciousness towards reality. Reality in this sense was understood as a process of becoming, a totality. Only the practical class consciousness of the proletariat, grasping itself as the subject of the social totality, could be expected to transform a theory of *praxis* into a practical theory which overturns the

real world, revolutionizes the totality and overcomes the process of reification. Even then it would succeed only as long as it retained its practical orientation and avoided the Hegelian pitfalls of schematization, repetitive mechanical patterns (such as the famous triad: thesis, antithesis, synthesis), and the undialectical project of extending its attention beyond human society to a philosophy of nature.

Lukács's reaffirmation of Hegel's relevance was in one sense a reclamation of Marx for the European philosophical tradition, and a challenge to the increasing tendency to sanctify Lenin, visible in the last months of the latter's life and stridently pursued by Stalin in the campaign of bolshevization. His strictures against Hegel's shortcomings were in another sense an implicit reproach to the codification of Marxism into a set of rigid abstractions, culminating in the *Short Course*. He reaffirmed the dialectical relationship between subject and object, between theory and practice, as a fundamental tenet of Marxism which guaranteed its progressive and transformative potential. The alternative, he argued, would be a relapse into Utopian dualism, characteristic of revisionism, and generating an ossified theory which would serve as a catch-all justification of any kind of practice. This would most likely lead to a conservative right-Hegelian worship of the state from which Marx had rescued the posterity of Hegel. It is not difficult to see the Marxist-Leninist equivalent looming over the argument.

But Lukács did not only set a challenge to Soviet Marxism, he also set an intellectual agenda for an alternative, Hegelianizing Marxism. Cultured and humanistic in its ethos, it drew strength from romantic idealism and traditions of religious fervour. The philosophy of alienation offered a subtle dialectic with a strong appeal to intellectuals, while the philosophy of *praxis* offered a basis for activism and engagement in the political struggles of the working class, cast as the secular source of salvation. Over the longer term, the richness of Lukács's conceptualization, and the many philosophical links it made with the European intellectual mainstream, made *History and Class Consciousness* a bridge between the western New Left of the 1960s and the non-Stalinist roots for which it was so ardently searching. Lukács himself, though long-lived, played a singularly distant role in his own rediscovery, obliged as he was to play intellectual hide and seek with the political authorities in Moscow and Budapest. For most of his career, he was much more widely recognized as a literary theorist and critic of European literature, deeply involved in the cultural controversies, and more than a little reticent about his earlier philosophy.

Though he was much read, Lukács had few disciples in central Europe. Perhaps the most noteworthy is the Romanian scholar, Lucien Goldmann (1913–70), who met and admired Lukács in Vienna but spent most of his adult life in Paris, where he distinguished himself primarily through his analysis of French literature using approaches drawn from Lukács and from the structuralism of Jean Piaget.

Closer in spirit and preoccupations was Lukács's contemporary and friend Karl Korsch (1886–1961). A leading figure in the powerful German Communist Party of the 1920s, Korsch took a leftist stance vehemently opposed to the bolshevization of the Communist International. His most influential work, *Marxism and Philosophy* (1923), aroused sharp hostility and, with other oppositional leaders he was eventually ousted from the Party. In 1936 he emigrated permanently to the United States.

Korsch noted that nineteenth-century Marxism had largely ignored philosophy, and he

traced the fact to Marx's and Engels's view that their materialist conception of history and society was destined to supersede classical German philosophy, from which it sprang, and ultimately destined to replace philosophy. He castigated the undialectical approach of those who had assumed that philosophy was therefore abolished, and of those who wished to reinstate it, pointing out that its abolition was necessary but dependent on the revolutionary transformation of the historical circumstances which produced it. Since this transformation had not taken place, the rejection of philosophy was premature, while its reinstatement was retrograde. The result of abolition was that Marxist economic or political theory were being proposed as value-free sciences which could equally be used by opponents of socialism, and that in practice socialists were combining Marxism with various substitute philosophies which did provide systems of values. Conversely, the result of reinstatement was to reinforce philosophy as an obstacle to the process of its own historical suppression.

Since Korsch was attacking both the theorists of the Second International, who had abandoned philosophy, and those of the Comintern, who were reinstating it, he attracted fierce criticism from both sides. There were strong affinities between his position and that of Lukács, but both were increasingly isolated voices in the political aftermath of the failure to achieve socialism internationally. The revolutionary fervour and the messianic tone of their thought did not chime with the increasingly inhospitable social and political climate in central Europe.

More consonant with the disillusioned and embattled left of the interwar period is the work of Walter Benjamin (1892–1940), a Berliner who largely avoided political activism but expressed a revolutionary Marxist approach in his critical essays. Benjamin was a critic and historian of culture, rather than a philosopher, sharing the perception of the Frankfurt school (which is treated elsewhere in this volume) that culture had in some respects overtaken politics as the main field of struggle. His work on Brecht (with whom he enjoyed a close friendship) and Baudelaire, and his more philosophical essays collected as *Illuminations,* began to attract renewed attention in western Europe during the 1970s. Benjamin was a deliberately non-systematic thinker, considering images, aphorisms and allegories as a more potent means of gaining purchase on the course of history. Progressive change was likely, he thought, to arise either from a long-term strategy of attrition or from an extremely focused unleashing of explosive social forces. In either event, his approach was expressed in the contemporary maxim of 'pessimism of the intellect, optimism of the will', and he summed up his conception of history by reference to a drawing by Paul Klee showing the angel of history facing backwards to look with pity on the debris of its victims, but propelled into the future by a storm blowing from paradise, which constitutes progress. Benjamin himself fell victim to the upheavals of history, taking his own life to avoid falling into the hands of the Gestapo as he attempted to flee from occupied France into Spain.

Central European intellectuals, caught between the hammer of fascism and the anvil of Marxism-Leninism, plunged into an understandable slough of despond with the approach of war. The basis for any optimism was slender, but, such as it was, it was articulated in the philosophy of possibility of Ernst Bloch (1885–1977). Born and educated in Berlin, Bloch developed a syncretic philosophy in which Marxist elements jostled with religious mysticism, vitalism and classical German philosophy. During his wartime exile in the

United States, he wrote most of his major work, *The Principle of Hope,* which was published in East Germany, where he had returned, during the 1950s. He later fled to West Germany following disagreements with the communist authorities which he had generally supported, without becoming a party member.

Bloch's thought, expressed almost as aphoristically as Benjamin's, follows a humanist inspiration to argue that the basic nature of a human being is characterized by living and working towards a future goal which is in the process made real, actualizing one out of the many potential forms of existence. The task of creating a utopia is central to human existence, and falls not only to the intellect but also to the imagination and emotions, which can awaken latent possibilities within the present. Ever since earliest times, human societies have woven images and stories of utopias, which they have variously attempted to bring into being, without ever completely succeeding. The constantly renewed drive to do this is a principle of hope which energizes human activity and finds its highest expression in the Marxist project of a concrete utopia, which can be compared with the kingdom of heaven.

Bloch's very unspecific characterization of what kind of utopia may be hoped for is in sharp contrast with his euphoric endorsements of East German social achievements, and he has been criticized for both. But, assisted by his own longevity, Bloch's work is another important contribution from the generation of central European Marxist philosophers who were formed and continued to write outside the orthodox Marxist-Leninist framework. Though Bloch, Benjamin, Korsch and Lukács are in many respects different both politically and philosophically, they do share common roots in the classical German philosophical tradition which culminated in Hegel, and a deep regard for the value and efficacity of European cultural traditions. It is this shared culture which gives them their potential for resisting the reduction of philosophy to an instrument to be used, modified or discarded as it suits a particular political purpose.

ITALIAN MARXISM

From the end of the First World War to the end of the Second, Italian Marxism led an underground life, most of which was only brought to wider attention long afterwards. It was not born in the underground, however. Before the Great War, Marxists were well-established figures in the Italian mainstream, active participants in debates which were shaped by the neo-Hegelian revival.

Most prominent of the early Italian Marxists was Antonio Labriola (1843–1904), whose *Essays on the Materialist Conception of History* (1895–1900) were read throughout Europe at the turn of the century. His undogmatic and humanist approach was alert to the sinuosities of history but lyrical about the mission of the proletariat to give meaning to it. His thought left its mark on philosophers like Benedetto Croce (1866–1952) and Giovanni Gentile (1875–1944), who both grappled with Labriola's Marxism before taking an avowedly Hegelian path away from it towards liberal and, in Gentile's case, fascist conclusions. The triumph of Mussolini in the early 1920s created extraordinary difficulties for communists and Marxists in Italy, with activists driven into exile, or hiding, or prison. In exile, a leader like Palmiro Togliatti (1893–1964) was able

to shape the political direction of the Comintern, though not the development of Marxist philosophy.

Paradoxically, it was the imprisonment of the Italian Communist Party leader, Antonio Gramsci (1891–1937) that produced the most influential theoretical and philosophical development. Born of a poor family in Sardinia, Gramsci studied history and philosophy at the university of Turin before throwing himself into revolutionary politics early in the First World War. He became an editor of the influential socialist review *Ordine nuovo* ('New order') in 1919 and played a key role in the foundation of the Italian Communist Party, becoming its leader in 1923, when his policy of broad alliances eventually prevailed. His political activity in Italy and abroad ended when he was arrested in Rome and imprisoned in 1926. Spending the rest of his life in appalling conditions in prison and hospital, Gramsci wrote prolifically, reflecting deeply on Marxist principles in virtual isolation from current events. His influence stems mainly from his *Prison Notebooks,* which were published in Italy soon after the Second World War but only became widely known during the late 1960s, when they were identified as offering an attractive alternative to Soviet Marxism.

Philosophically, Gramsci's affinities were with the Hegelian tradition which he had encountered through Croce. He considered that Marx's achievement had been to create a synthesis from the two opposing schools into which Hegelianism had divided. He also thought that Marx's own posterity had divided into two schools, mechanistic materialism and dialectical idealism, which now needed to be welded into a new synthesis. His proposal was a philosophy of *praxis,* a name he chose partly as a code-word for Marxism to placate the prison censors but partly also because it encapsulated his distinctive conception of history as an aggregation of human practical activity.

At the core of Gramsci's philosophy was the humanist question: what is man? A later generation, attempting to meet feminist critiques, has rephrased the question: What is human existence? Gramsci's answer was that humanity is reflected in every individual person, and consists of the individual, other people and nature. The individual enters into relationships with other people and with nature, primarily through work, generating a network of relationships. These relationships form organic social entities, which become conscious of themselves and become capable of purposeful and effective action. Thus the individual is an integral part of the process of change which is history, its conscious motive force, and the whole complex of changing relationships is part of each individual. Human existence is synonymous with the socio-historical process and the question 'what is human existence?' must therefore be reformulated as 'what can human existence become?'

Within Gramsci's humanist vision, philosophy appears as the consciousness of the historical process, not only a dimension of the totality of human *praxis,* and therefore inherently political, but also part of the consciousness of each individual within it. It was in a sense a collective subjectivity, and its value lay in its appropriateness to the task of the collectivity rather than in its relation to any objective reality. In any case, he questioned whether it was meaningful to speak of a reality existing independently from human *praxis*. He thought it necessary for the unity and advancement of humanity that philosophy should overcome the distance, frequently observed, between the doctrine of the intellectuals and that of ordinary people. There was in particular, he argued, a need

for Marxism to foster intellectuals who were an organic part of the working people and capable of raising the level of consciousness of the masses, without bringing elitist ideas from outside. In this way, it would, he suggested, be possible to build a unity of ideas and political action which could challenge the hegemony of bourgeois philosophy and politics.

The concept of hegemony is Gramsci's most influential and contentious innovation, since it emphasizes that the exercise of power in a society is secured not only by the repressive use of state power but also more crucially by the maintenance of a moral, intellectual and cultural consensus. For the working class and its allies to win power, it is not sufficient to engineer a *coup d'état,* it is also necessary to build an alternative cultural consensus capable of securing hegemony. This is a much broader and more long-term task, requiring a different kind of organization from the highly centralized and disciplined parties built by the Comintern. Learning lessons from the ideological power exercised by the Catholic Church, Gramsci was responding to the fact that Mussolini's fascism had been successful in gaining popular support, and recognizing that a long 'war of position' would be needed to win over the masses for socialism. The alternative, which he rejected, was to fall back on faith in the likelihood of the blind workings of history producing a suitable revolutionary opportunity. For socialists reading Gramsci thirty years later, however, hegemony appeared to emphasize the strategic importance of ideological and cultural struggle as an alter-native to traditional politics, which seemed to offer no prospect of radical change.

Because of their fragmentary, allusive and often obscure nature, Gramsci's prison writings allow of a range of interpretations. At one end of the range, they can be seen as a restatement of fairly orthodox Marxism-Leninism, somewhat veiled by the circumstances in which they were produced. That is largely how they were presented when they were first published. At the other end of the range, they can be interpreted as a penetrating rebuttal of Soviet Marxism which offers an entirely different basis on which to develop Marxist philosophy. That is largely how they have been received since their rediscovery in the 1960s. The philosophy of *praxis* served to challenge the distinction between theory and practice, obviating the need for a body of theory and thus for the scholastic apparatus of hitherto existing Marxism. The concept of hegemony served to challenge the distinction between base and superstructure, reducing the importance of economics, at a time of relative prosperity, and increasing that of cultural theory, at a time of rapid expansion in audiovisual communication. In this way Gramsci's posthumous reputation grew both from his conceptual innovations and from the new political directions his ideas opened up.

In postwar Italy, Gramsci's humanist and historicist positions dominated Marxist debate for many years, assisted by the success of the Communist Party in giving intellectuals an organic role to play within political activity. His influence was not unchallenged, however. In particular, Galvano della Volpe (1895–1968) maintained a persistent critique of historicism, which he regarded as a product of the contamination of Marxism by Italian idealist philosophy. An academic rather than an activist, della Volpe drew on the egalitarian and democratic thought of Rousseau, counterposed to the Hegelian theory of the state, and argued that Marxism should concern itself with specific scientific knowledge of the world, rather than with indeterminate abstractions.

With the political effervescence of the 1960s came a flourishing Marxist culture which permeated most areas of intellectual inquiry, prompting intense philosophical debates between the diverse movements and schools of thought which sprang up inside and outside the Communist Party. Two philosophers of the far left may be mentioned as having been influential in the English-speaking world. Lucio Colletti, brought up in the tradition of della Volpe, sought to demystify the historicism of Gramsci and to refute the view that Marxism could draw on an underlying materialism in the dialectic of Hegel, whom he regarded as essentially a Christian philosopher. Ultimately, however, he concluded that dialectical mystification was present even in Marx, and he began to distance himself from Marxism. His hostility to idealism was shared by Sebastiano Timpanaro, who attacked the French attempts to reconcile Marxism with existentialist (Sartre) and structuralist (Althusser) theories. A strong proponent of materialism, which he saw as lacking in Gramsci, Timpanaro asserted the objectivity of scientific knowledge and sought recognition for the autonomous existence of the natural world, necessary as a theoretical basis for science and for ecological awareness.

These philosophers are not proposed as representative of debates over the past thirty years, and the present study cannot offer an extensive survey of the variety of Italian Marxists. They include a Utopian Marxism strongly imbued with Christian spiritualism, and several suggested combinations of Marxism with other contemporary schools of thought (psychoanalytical, ecological, feminist among others). Moreover, as the example of Colletti suggests, Marxist philosophy shades into other philosophical movements. With the transformation of the Italian Communist Party into a social democratic party, it may be that Italy has largely lost the institutional framework which made it important, or even possible, to distinguish Italian Marxism from other philosophies which are not specifically Marxist.

FRENCH MARXISM

Marxist philosophy came late to France, despite the close contacts which Marx and Engels had with French socialists. This was partly because Proudhon's syndicalist socialism continued to have a deep and abiding influence, and partly because of the periods of repression following the failed revolutions of 1848 and 1871. In the 1890s, Marx's daughters, Laura and Jenny, and his two French sons-in-law, Paul Lafargue and Charles Longuet, did a great deal to make his ideas known in France. Lafargue (1842–1911), the most active of them, propagated a highly simplified economic determinism which Marx himself was wont to criticize. His main opponent, Jean Jaurès (1859–1914), countered this with a neo-Kantian ethical socialism in which he hoped to synthesize Marx's ideas with various other progressive doctrines. Their debate was largely curtailed by the intellectual truce which followed the unification of the main socialist groupings in 1905.

The most sophisticated French contributor to pre-war Marxism, Georges Sorel (1847–1922), was a maverick whose unorthodox Marxism included an unusually vigorous attack on rationalism, and a corresponding advocacy of revolutionary myth. At odds with most of his contemporaries, Sorel's ideas were more influential outside France, especially in

Italy, where Mussolini claimed them as an inspiration for his fascist movement.

After the First World War, a new generation of young intellectuals gradually introduced a thriving Marxist culture, within or on the margins of the Communist Party. Most prominent of them was Henri Lefebvre (1901–91), a prolific and long-lived thinker who set his mark on sociology as well as on Marxist philosophy. Emerging from the surrealist movement of the 1920s, he used his energy and erudition to popularize the early writings of Marx, some of which he translated into French, and to publish several volumes by or about Hegel, who was just beginning to arouse interest in France. Enjoying the more intellectually relaxed climate of the Popular Front period, Lefebvre wrote what eventually became the most successful short exposition of Marxism in France, *Dialectical Materialism* (1939). Despite its orthodox-sounding title, it set out a humanist Marxism fundamentally opposed to that of the *Short Course,* which appeared at about the same time.

Lefebvre affirmed the superiority of Hegel's dialectic over formal logic, based on the dialectic's attempt to achieve a synthesis of the concept and its content, and thence a synthesis of thought and being. What distinguished the Marxist dialectic was that, whereas Hegel had sought to derive the content from the concept, Marx saw the need to enable the content to direct the development of the concept. The resulting dialectical materialism, he thought, transcended both idealism and materialism, and oriented the dialectic towards a resolution of contradictions in practical activity, or *praxis*. The unfolding of dialectical *praxis* in history would, he believed, lead to the practical realization of the full potential of human existence in what he called 'Total Man'.

Recognizing the obstacles to the fulfilment of the dialectic of *praxis,* Lefebvre systematized the analysis of alienation, which he argued was a fundamental structure of human activity, and could be summarized in terms of a three-stage evolution. In the first (spontaneous) stage, activity generates some form of order in response to needs; in the second (conscious) stage, the spontaneous order is shaped into rational structures so as to work more effectively; and in the third (illusory) stage, the rational structures become fixed and fetishized, beginning to hinder further development, and being misappropriated and used as an instrument of oppression by one group over another. The revolutionary overthrow of alienated structures thus appears as a requirement of human self-realization. It is clear that, by its generality, Lefebvre's analysis can be applied to the oppressive role of the state under communism as much as under capitalism, and to the sclerosis of thought in the Communist Party as much as in the Sorbonne.

In the first years after the Second World War, Lefebvre was lionized by the French Communist Party (PCF) as one of its most distinguished intellectuals but, unlike its Italian counterpart, the PCF tended to regard major intellectuals as figures of symbolic rather than practical importance. With the tightening of the Cold War, he was reproached for his lack of orthodoxy, and withdrew from philosophy into sociology, which provided the focus for his subsequent work. In the late 1950s he became an influential figure on the non-communist left, where his dialectical humanism was widely welcomed as an open and non-dogmatic basis for social critique. His conception of philosophy also shifted to a suspicion that any general philosophical assertions would be likely to fall into mystification. Ontological or cosmological statements should, he thought, be left to poets and musicians, and Marxist philosophy should concentrate on honing the concepts of

dialectics as a critical method, to be part of what he termed metaphilosophy. This meant that *praxis,* which was action-oriented, should be supplemented by other dimensions, including a creative function, which he termed *poesis,* to form a concept of 'everyday life'. More productive in sociology than in philosophy, Lefebvre's humanist and Hegelian Marxism offered plausible explanations for the uprising of students and workers in France in May 1968 and proved an attractive conceptual framework for some members of the radical movements involved.

The chief spokesman for Marxist-Leninist philosophy in the postwar period was Roger Garaudy (b. 1913), who articulated a Stalinism of strict obedience up to the 20th Congress of the CPSU in 1956. In its aftermath, he had the task not only of leading the philosophical denunciation of Stalin but also, implicitly at least, of finding a suitable replacement philosophy for the French Communist Party. His first step was to propose a Marxist humanism directed towards the discovery of Total Man, little different in substance from that of Lefebvre, though political difficulties made it impossible to acknowledge the debt. His second step was more original, however, in that he sought an explicit dialogue with other forms of humanism, particularly in the Catholic and existentialist intellectual movements. The vitalist philosophy of Teilhard de Chardin, exercising widespread posthumous influence, seemed to offer significant common ground, though Garaudy stopped short of accepting that evolution would culminate as Teilhard suggested, in the creation of God. Garaudy turned to Hegel, who was also attracting the interest of theologians, as a possible basis for a common humanist philosophy. The alarm his 'God-building' caused in communist circles was a material factor in leading the Party to abandon the notion of an official philosophy in 1966. Disavowed by the Party for disagreements over the events of 1968, Garaudy underwent a religious conversion, first to Catholicism and then to Islam.

The most trenchant opponent of the path followed by Garaudy was Louis Althusser (1918–90), who developed a critique of humanist Marxism, producing in the process an innovative and influential philo-sophical reworking of Marx, expressed in two studies published in 1965, *For Marx* and *Reading Capital*. A professional philosopher rather than an activist, he was initially inspired by Mao Tse-tung's writings on practice and on contradiction, and was widely followed in French Maoist circles of the 1960s and early 1970s. Althusser began from a reexamination of the history of Marxist philosophy, in which he argued that there was a radical discontinuity between Marx and his predecessors, Hegel and Feuerbach. He suggested that Marx had first rejected the idealist system of Hegel, and then the materialist humanism of Feuerbach, in order to emerge with a distinctive and scientific theory. He dismissed the view that the theory was a supersession of Hegel and Feuerbach, which would imply that it conserved important parts of their philosophy, and argued that Marx had made an epistemological break, establishing his theory as a science of history, entirely distinct from the ideological conceptions from which it has emerged. He noted that ideas and concepts tended to emerge in response to a historical situation and to aggregate into more or less coherent combinations, each of which formed a problematic. Retaining a particular concept generally implied accepting the entire problematic to which it belonged, and thus mature Marxism had to exclude ideas drawn from pre-Marxist problematics. Marx's own early writings with their notions of alienation, human self-realization and Hegelian dialectics

came before the epistemological break and should therefore be considered as belonging to pre-Marxist and unscientific problematics. Althusser conceded that Marx's later writings sometimes contained ideological residues, but generalized his argument to assert that the concept of the epistemological break could be applied to distinguish what was scientific (or theoretical, as he preferred to say) from what was ideological in Marx's work, or in the work of anyone else. In this way theoretical practice could be clearly separated from ideological practices.

Althusser next identified the problem that while the mature Marxist theoretical practice was well developed, Marx had never gone back to reformulate the philosophical principles which it implied. There was, in other words, no theory of theoretical practice. In its absence, various ideological approximations were made to serve, most of them Hegelian in origin. He suggested that these had now become an obstacle to the further development of Marxism, and set himself the task of undertaking a philosophical reading of Marx, Engels and Lenin, especially Marx's major work *Capital,* attempting to elucidate a theory of theoretical practice. Since such a theory was not articulated explicitly, the texts would need to be read 'symptomatically', to detect symptoms which might point to the theory at work in a practical way. If the theory had not been supplied by Marx, it could certainly not be taken from Hegel or Feuerbach. Althusser consequently drew from Spinoza'srationalism, Freudian psychoanalysis and Saussurean structural linguistics to provide usable concepts.

Althusser began with the concept of contradiction. The Hegelian notion of a struggle of opposites was replaced by the notion of a process of production, in which a raw material of some kind was transformed into a product by some process of transformation involving human work, or practice, and an appropriate means of production. In societies, or social formations, there are four main processes of production, each with many subsidiary processes: they are the economic, political, ideological and theoretical practices. These practices are highly interlocking in that each is conditioned by all the others, a situation which he designated 'overdetermination', borrowing from Freud's analysis of dream images. Contradictions, or transformations, in one level of practice might transfer to or condense in another, and if contradictions in several or all practices came to fuse together, then a general transformation or revolution would be likely to ensue.

The concept of overdetermination was presented as a more complex, and more rigorous, basis for the analysis of history than the Hegelian dialectic it replaced, and contained a different conception of causality. The linear cause-and-effect principle of classical physics, and the expressive causality of the Hegelian dialectic, were replaced by a structural causality in which a particular event is not determined by an earlier event or a more fundamental event, but is overdetermined by a structure of practices to which it belongs. There is no centre to the structure, and since practices develop unevenly, one of them is dominant in the structure at a given time, though none is permanently so. Even economic practice has no permanent domination, though it has the special power of determining which practice does dominate. This is Althusser's version of the base-and-superstructure model of society, reformulated to give greater relative autonomy to the superstructures, which no longer merely reflect the economic base. Thus, although economic developments are determinant in the last instance, there is no moment at which

they abruptly take over, and so 'the lonely hour of the last instance never comes'.

Althusser's model was crowned in effect by philosophy (designated as Theory, or the theory of theoretical practice) which had the role of ensuring the coherence and rigour of other theories (and their corresponding practices), and therefore appeared as a science of sciences. Criticized for his theoreticism, he devoted most of his writings after 1968 to self-criticism in which a series of retreats from 'high' Althusserian positions was accompanied by further conceptual innovations. Three of these may be mentioned as particularly influential. First, he advanced an alternative conception of philosophy as class struggle in theory, and as a weapon in the revolution. This suggested that its role was to ensure the theoretical correctness of political practice and the political correctness of theory. Second, he redefined the dialectic of history as a process without a subject or a goal, as opposed to the Hegelian dialectic which was both humanist, in seeing human existence as the subject of history, and ideological, in seeing history as advancing purposefully towards some final end. And third, he offered an account of ideology as the necessary illusion of a lived relationship between individuals and their circumstances. In this, he argued that most of the apparatuses of a modern state are primarily ideological, rather than repressive, in that their main function is to elicit the consent of the governed. People are incorporated into these ideological state apparatuses by the effect, which all ideology has, of calling on individuals to recognize themselves as subjects, in the sense both of being persons responsible for themselves and of being subordinated to an authority. His analysis of ideology has been widely adopted in critical theory and political philosophy internationally.

Of the philosophers who have continued Althusser's work, three are particularly worthy of note. Etienne Balibar developed a critique of the abandonment, in France and elsewhere, of the concept of the dictatorship of the proletariat, and has applied Althusserian analysis to issues of nation, race and class. Pierre Macherey developed a theory of how literature is produced, rather than created, and reveals the contradictions which ideology serves to conceal. He also advocated an appropriation of Spinozist conceptions by Marxism in preference to Hegelian ideas. Georges Labica re-examined Marx's early writings, criticizing the simplistic schema of his adoption of English political economy, French socialism and German philosophy, and arguing that he finally succeeded in escaping from philosophical mystifications only by substantially abandoning philosophy in favour of a science of history. Labica is also the major French instigator of academic research into the history of Marxist thought.

Althusser's ideas remained oppositional on the French left, partly because of his political disagreements with the French Communist Party, of which he was a member, and partly because non-communist critics tended to view his enterprise as an attempt to rescue Stalinist conceptions. His name was largely erased from public discussion after 1980 when he killed his wife, in a bout of his recurrent psychiatric disorder. None the less, many of his ideas became common currency in Marxist philosophy, and have had widespread influence particularly in literary and cultural criticism. Paradoxically, his onslaught against Hegel also had the effect of stimulating renewed interest in Hegelian studies in France.

Several Marxist philosophers responded to the challenge by carefully re-examining the concepts which had come through Hegel. Jacques D'Hondt sought to rehabilitate the

progressive content of Hegel's own life and thought. Solange Mercier-Josa argued that it was productive to look at the original Hegelian versions of Marx's main concepts so as to grasp the originality of his reworking of them, and also perhaps to retrieve some useful Hegelian concepts which Marx neglected to rework. Perhaps the most comprehensive of the attempts to find a synthesis in the Hegelian style is the work of Lucien Sève. In a series of studies, culminating in a compendious work, *An Introduction to Marxist Philosophy* (1980), Sève sought to systematize the concept of contradiction, suggesting that the distinction between antagonistic and non-antagonistic forms should not exclude their mutual interpenetration. He maintained the Hegelian distinction between objective and subjective dialectics and consequently between real historical development and the logical ordering of concepts with which to grasp it, while at the same time affirming the dialectical relationship between them. Sève also argued that Marxist materialism, understood as a scientific approach to knowledge rather than as a political ideology, was not specifically atheistic and should be open to learning from what religious thought expressed in intuitive or imaginative terms.

The breadth and erudition of Marxist philosophy in the 1960s and 1970s made it one of the dominant currents in French and European intellectual life, with a strong place in the schools and universities, as well as in political discourse. Towards the end of the seventies it began to run out of steam, under a combination of pressures which included the alternative attraction of other schools of thought (feminism, poststructuralist, psychoanalysis, ecology, spiritualism and postmodernism), as well as shifts in national politics and the accelerating decline of communism internationally. A variety of strategies was proposed to rejuvenate Marxism, including the incorporation of Italian Gramscian and Anglo-Saxon analytical versions of Marxism, but more often including eclectical borrowings from non-Marxist currents. Perhaps most significant was the impact of questioning from various quarters as to the need for, or legitimacy of, such a comprehensive intellectual enterprise (or master-narrative) as Marxism had historically undertaken. It was a question which struck an undeniable chord with intellectuals who were increasingly working without reference to a real or imagined Marxist collectivity (state, party or professional grouping) which could give a communal identity or an institutional basis to their thought. As a result, Marxist philosophy was in serious disarray even before the historical events of 1989 plunged it into catastrophe.

CONCLUSION

Since the present study is undertaken in the perspective of 'continental philosophy', it would not be appropriate to conclude without evoking the implied standpoint of the observer, that is, the philosophy of the English-speaking world, and in particular of the British Isles. The supposition that continental philosophy is something which happens elsewhere, on a real or imagined continent of Europe, indicates the extent to which the dominant currents of English-speaking philosophy have sought to isolate their intellectual traditions from foreign influences. In practice, English-speaking academic philosophy has been deeply engaged with continental European philosophers, even though they have often, like Popper or Wittgenstein, been regarded as honorary English philosophers. The

strategy of exclusion implied by the term ‘continental’ serves to keep out undesirables, of which the least desirable has generally been the Marxist tradition. Until recent times, the exclusion of Marxism from at least academic philosophy has been largely complete, with the result that it has fallen to other disciplines, particularly literary and cultural studies, sociology, politics, history, geography and archaeology, to introduce continental Marxist philosophers to English-speaking intellectuals.

Marxism-Leninism was given some currency through the agency of communist parties, whose small size tended to exacerbate their dependence on Moscow. But for most of the period from the 1920s to the 1960s its influence was confined to the trade union movement. During the 1930s a small number of intellectuals were attracted to communism, and one of them, Christopher Caudwell, might have founded an indigenous Marxism in Britain had he not been killed fighting for the Republic in Spain. Later, Maurice Cornforth (1909–80) was an effective exponent of Marxist-Leninist philosophy, applying it in polemics against Popperian positivism and linguistic philosophy during the 1960s, and began to formulate a more critical view of Marxism shortly before his death. During the 1970s, English-speaking communist parties, in rapid decline, divided between Marxist-Leninists and Eurocommunists, who took Gramsci as their main philosophical inspiration.

During the 1960s a strong interest in Marxism emerged in the New Left groupings which were founded by dissident communists and Trotskyists. They drew on the non-Marxist-Leninist writings which were being published in France and Italy. The American journal *Telos* and the English journal *New Left Review,* and its publishing house, played a major role in the cultural, political and historical fields, in translating and introducing the work of Marxists who have been discussed above. From the early 1970s, the journal *Radical Philosophy* played a similar role with particular emphasis on philosophical discussion, by no means all Marxist. The growth of a flourishing English-speaking Marxist culture was visible from the 1960s with the emergence of literary and cultural critics like Raymond Williams, Stuart Hall, Terry Eagleton and Fredric Jameson, and historians such as E.P. Thompson, Christopher Hill, Eric Hobsbawm and Perry Anderson, among others. Philosophy proved more resistant to Marxist influence, though it is visible in the philosophy of science, particularly in the work of Roy Bhaskar, whose theory of scientific realism was linked to a project of general human emancipation. More ambitious and influential has been the work of Jon Elster and G.A.Cohen, who have attempted to reformulate the main principles of Marxism in terms of analytical philosophy. The confrontation of Marx with Popper, Keynes and Austin produces insights which are refreshing within the analytical tradition and challenging to Hegelian dialectics. The reconciliation is inevitably incomplete, however, and involves rejecting much of Marx’s socialism and historical materialism.

English-speaking Marxist theory has developed in relative dissociation from powerful Marxist political movements. It has keenly observed such movements abroad, but their domestic counterparts have been either far left groups with marginal influence or mainstream parties with little commitment to particular doctrines. Its academic detachment has to some extent insulated it from the debacle of communism in 1989. That year did not bring Marxist philosophy to an end, but it does provide a convenient point at which to end the narrative of its history. Though it is always rash to extend history so far

towards the present that it cannot be seen at any historical distance, 1989 is mainly significant in that the collapse of communism, symbolized by the breaching of the Berlin Wall, was a turning point in international history heavy with consequences for Marxist philosophy. While some English-speaking writers have continued to feel at ease in a broadly Marxist moral and philosophical framework, the political fall-out of 1989 has impelled others to take a more sympathetic view of other alternatives. This latter tendency is also encouraged by the increasingly chill winds blowing from the continent on unreconstructed Marxism.

Marxist philosophy has generally been distinguished by its close relationship to its social context, and in particular to the institutional forms through which its practical and political orientation is mediated. In its most institutional form, Marxism-Leninism, it became inextricably tied to the Soviet state and to the network of communist parties and client states which pledged their allegiance to it, including *mutatis mutandis* the Chinese variant. To a large extent, it has collapsed with the states and parties which sustained it, and, in Europe at least, writings in this tradition are now unreadable, except as historical docu-ments, or as liturgy for the fragmented groups of old believers who continue to keep the faith. The question which remains posed is how far this erasure will affect other Marxist traditions which have been outlined in the present chapter.

The answer can as yet be only speculative, but it is probable that the future of Marxism as an identifiable philosophy will depend on the persistence or emergence of states, groupings or movements which can provide a plausible institutional basis for the imperative to change the world as well as interpreting it. It is unlikely for the foreseeable future that any individual state will provide such a basis, and the calamities which have overtaken those which did so in the past will more probably serve as a counter-example. Similarly the health and influence of those political parties which still claim the name communist or Marxist suggests that they are scarcely better placed. If the link between theory and practice is taken seriously, then the failure of practice must call into question the validity of the theory. It is only a partial defence to argue that the previous practical implementation of the theory was deficient, since that accepts a substantive severance of the link.

If the chief originality of Marxism is that it claimed to have the means to put its theory into practice, then it has largely lost that originality. An attenuated commitment to change would effectively place Marxism in the same position as any of a number of philosophies which express moral or social imperatives with general hortatory effect. Viewed in this light, it becomes less important to set precise limits on what may be called Marxism. For most of its history, Marxist philosophy has had an active and influential place as a strand in many currents of thought. Some, like the Frankfurt school, took it as a starting point; some, like the French existentialists, attempted to marry it with another tradition; and some, like the structuralists, accepted it as one element feeding into their theory. There is no reason to suppose that the process of intellectual cross-fertilization is likely to come abruptly to an end.

The loss of a distinct and coherent tradition of Marxist philosophy would in some respects liberate its proponents from their obligations to a collectivity, and perhaps also from the authority of a canon. In other respects, however, it would remove a point of reference and an identity, which has had the unusual role of forming common links

between the different cultural and intellectual environments of Europe whether western, central or eastern, and of opening them out to a wider world outside. The resistance to overarching world-views or master narratives is no doubt in part a response to the constricting effects of international Marxism especially in its dogmatic forms. In a world where postmodernism is setting the intellectual and cultural agenda, there may be a role for a humanist post-Marxism which retained its varieties and its international dimensions without proclaiming the necessity or authority to synthesize them. But if Benjamin's angel of history is still being driven by the storm from paradise, it is unlikely to linger over the debris that it leaves behind, and it remains to be seen how much of Marxist philosophy will survive from the wreckage.

BIBLIOGRAPHY

The following is a list of some of the relevant texts published in English. It is divided into primary texts and critical texts, though in the nature of the subject, the distinction between the two is in some respects arbitrary.

CHAPTER 8
Critical theory

Horkheimer, Adorno, Habermas

David Rasmussen

HEGEL, MARX AND THE IDEA OF A CRITICAL THEORY

Critical theory[1] is a metaphor for a certain kind of theoretical orientation which owes its origin to Hegel and Marx, its systematization to Horkheimer and his associates at the Institute for Social Research in Frankfurt, and its development to successors, particularly to the group led by Jürgen Habermas, who have sustained it under various redefinitions to the present day. As a term, critical theory is both general and specific. In general it refers to that critical element in German philosophy which began with Hegel's critique of Kant. More specifically it is associated with a certain orientation towards philosophy which found its twentieth-century expression in Frankfurt.

What is critical theory? The term bears the stamp of the nascent optimism of the nineteenth century; a critical theory can change society. Critical theory is a tool of reason which, when properly located in a historical group, can transform the world. 'Philosophers have always interpreted the world, the point is to change it.' So states Marx's famous eleventh thesis on Feuerbach. Marx got this idea from Hegel who, in his *Phenomenology of Spirit,*[2] developed the concept of the moving subject which, through the process of self-reflection, comes to know itself at ever higher levels of consciousness. Hegel was able to combine a philosophy of action with a philosophy of reflection in such a manner that activity or action was a necessary moment in the process of reflection. This gave rise to one of the most significant discourses in German philosophy, that of the proper relationship between theory and practice. Human practical activity, *praxis* in the sense that classical Greek philosophy had defined it, could transform theory. There are two famous instances where Hegel attempted to demonstrate the interrelationship of thought and action in his *Phenomenology of Spirit,* namely, the master/ slave dialectic and the struggle between virtue and the way of the world. In the former example, which attempts to demonstrate the proposition, 'Self-Consciousness exists in and for itself when, and by the fact that, it so exists for another: that is, it exists only in being acknowledged,'[3] the slave transforms his or her identity by moulding and shaping the world and thus becomes something other than a slave. In the latter example, the modern way of the world (essentially Adam Smith's concept of the political economy of civil society) triumphs over the ancient classical concept of virtue as a higher form of human self-knowledge oriented toward freedom. Historical development, as the institutionalization of human action, became an element in human rationality. Critical theory derives its basic insight from the idea that thought can transform itself through a

process of self-reflection in history.

Marx, early on in his development in a text that has come down to us under the title *On the Jewish Question,*[4] argued from Hegel's critical insight into the context of modern society. Having already done an analysis a few months before of Hegel's *Philosophy of Right,* he turned his attention to the development of the modern state by reflecting on Bruno Bauer's essay by the same name. Here, he would come to the conclusion that the course of human freedom culminating in the modern state (which Hegel had so brilliantly documented as leading from slavery to emancipation—the so-called course of human reason) was no emancipation at all. Indeed, the promised liberation of modern society from the shackles of the Middle Ages had not occurred. Hence, the task of social emancipation which could be carried on by critical reflection would lead the very agents of that reflection to a further task, namely, the transformation of society through revolution. Consequently, the promise of critical theory would be radical social transformation. The ancient assumption that the purpose of reflection was for knowledge itself, allied with the further assumption that pure contemplation was the proper end of the human subject, was replaced by another end of reflection also to be derived from classical thought, but with its own peculiarly modern twist; theory when allied with *praxis* has a proper political end, namely, social transformation.

However, for Marx this was not enough. Two factors remained. First, whence was such knowledge to be derived? Second, what would be the nature of such knowledge? Between the autumn of 1843 and the summer of 1844, Marx would provide answers to both questions. The answers came in the form of a class theory in which the newly emerging 'proletariat' were to play the central role. For Marx, they became the concrete subject of history with the result that hopes for emancipation would be anchored in a critical theory, which would in turn be associated with the activity of a particular class. Again, Hegel had provided the groundwork for this understanding by associating the basic interest in civil society in his philosophy of law with the interest of a particular *Stände*. Of the three orders of society—agricultural, business and civil service—it was only the latter which could represent the universal interests of humankind. With Marx, that latter task was transferred from the civil servants, who could no longer be trusted, to the proletariat, who he somewhat confidently asserted would bring about the social revolution necessary to overcome the contradictions with modern political society.

With regard to the second question, it was again Hegel, the philosopher of modernity *par excellence,* who taught Marx to look not to intuition *per se* but to the manifestation of reason in practical institutional form for an appropriate understanding of the world. Hegel had been the first philosopher both to understand and to use the work of the political economists in his work. Marx, first in a review of James Mill's *Elements of Political Economy* and later in a much more elaborate fashion, would work out a thesis about the dynamics of history leading him to assert that economic activity had a certain priority in the development of history.

This thesis would lead Marx to assert shortly thereafter, in *The German Ideology,*[5] that for the first time real history could begin. The very assumption behind a book which had the audacity to put the term 'ideology' into the title was that thought alone was ideological. There was a higher truth which Marx, through his methodology, would be able to attain, namely the 'productive' activity of humankind. Human history would then

be simultaneous with human production. The term for this new approach to the world of reflection and action would be 'historical materialism' and it would attack other more 'idealistic' modes of thinking as 'ideological'. Hence, a critical theory would be able to unearth the false presumptions that had heretofore held humanity in their sway. Later, in *Capital,* Marx would label the kind of thinking which he had characterized as 'ideology' in *The German Ideology* as 'fetishism'. He did so in the famous last section of the first chaper of volume 1, entitled 'The fetishism of commodities and the secret thereof. Marx's choice and use of metaphor is interesting, if not compelling. He uses 'ideology', 'fetishism' and 'secret' as if there was some ominous conspiracy against humankind which a certain kind of critical and theoretical orientation could unmask. The term 'fetishism' had a religious origin designating a fundamental confusion regarding perceptual orientations to the world. The very assumption that a certain theoretical orientation could unleash the 'secret' behind ideology as a kind of 'fetishism' represented a kind of confidence that would not only shape the historical development of critical theory in the future, but also unearth its problematic nature.

At the risk of oversimplification, one might state that there are two basic strains in the history of German philosophy. One strain argues that thought or reason is constitutive, the other that it is transformative. The former orientation can be traced to the debate initiated by Kant over the limits of human reason, while the latter can be traced to Hegel's philosophy of history, which attempted to locate philosophical reflection in a discourse about the history of human freedom.

Critical theory could be said to ally itself with this latter theme, even though the constitutive element would play an ever more significant role. In its classical, Hegelian-Marxist, context, critical theory rests on the nascent Enlightenment assumption that reflection is emancipatory. But what is the epistemological ground for this claim? In other words, how is thought constitutive for action? Which form of action is proper, appropriate or correct? In the early writings, Marx attempted to ground the epistemological claims of transformative action in the concept of *Gattungswesen,* i.e., species being. This concept, taken directly from Ludwig Feuerbach, who in turn had constructed it from both Hegel and Aristotle, affirms that in contrast to the radical individuation of the subject in modern thought, the aim or purpose of a human being is to be determined through intersubjective social action. In Hegelian terms, one constitutes valid self-knowledge through social interaction defined as human labour. According to Marx, the problem with the modern productive process is that it fails to allow the worker to constitute him-or herself as a species being, i.e., as a person who can function *for* another human being. Hence, the labour process reduces him or her to an animal, as opposed to a human, level making him or her autonomous, competitive and inhuman—co-operating with the productive process and not with other human beings. The point of revolution would be to bring the human being to his or her full and proper capacities as a being for whom the species would be the end, object and aim.

There were problems with this view. To be sure, Marx represents the culmination of a certain kind of political theory that began with Hobbes, and which was in turn critical of original anthropological assumptions that saw the human being as an autonomous agent emerging from a state of nature. However, in a certain sense, the concept of species-being was as metaphysical as the Hobbesian notion of the human being in a state of nature, a

view which was so aptly and appropriately criticized by Rousseau. It is my view that Marx was aware of the essentially epistemological problem that lay at the foundation of his own thought. Does one ground a theory of emancipation on certain anthropological assumptions regarding the nature of the species, assumptions which were as metaphysical as those the theory was attempting to criticize? Marx attempted to overcome this dilemma by providing historical evidence. In this context, his later work, the volumes of *Capital,* represent a massive attempt to give an account of human agency which was both historical and scientific. Hence, the quest for a valid constitutive ground for critical theory began with Marx himself. Marx as a political economist would bring massive historical research to bear on the claim that capitalism is merely a phase in human development and not the be-all and end-all of history. Hence, as a true Hegelian, he would assert that like any economic system it bore the seeds of its own destruction. As a consequence, the metaphysical claims present in the notion of species-being would re-emerge as a claim about the implicit but incomplete socialization present in capitalism, which, when rationalized, would transform the latter into socialism. As is well known, Marx even went beyond that to attempt to develop, on the basis of his historical investigations, a scientific, predictive formula announcing the end of capitalism on the basis of the 'falling rate of profit'. The formula assumed that as capital advanced it would be able to generate less and less profit and so would lose its own incentive. Hence, the force of capitalism, unleashed, would lead to its own imminent self-destruction. The victor, of course, would be socialism, which would emerge from the fray, new-born and pure, the ultimate rationalization of the irrationalism implicit in capitalism. As the family would inevitably give way to the force of civil society in Hegel's philosophy of law, so capitalism would break down and re-emerge as socialism.

In 1844 the young Marx had accused his one acknowledged theoretical mentor, Hegel, of harbouring a certain 'latent positivism'.[6] There are those who would accuse the older Marx of having done the same. If capitalism is to fall of its own weight, what is the link between thought and revolutionary action that so inspired the younger Marx? Indeed, what role would the proletariat, the heretofore messianic class of underlings, play in the transformation of society? And what of critical theory? It too would be transformed into just one more scientific, predictive positivistic model. In Marx's favour, this desire to secure the claims of a critical theory on the firm foundation of positivistic science was always in tension with the more critical claims of exhaustive historical analysis. But it was Marx himself who bequeathed to the late nineteenth century, and subsequently by implication to the twentieth century, the ambiguities of a critical theory. One could imagine the great social thinkers of the nineteenth and twentieth centuries coming together to pose a single question: upon what can we ground a critical theory? Would it be the proletariat now transformed into the working class? economic scientific analysis? the critical reflection of a specific historically chosen agent (the vanguard)? informed individual *praxis*? Perhaps critical theory would produce a 'dialectic of enlightenment' so cunning that its very inauguration would produce its own destruction as certain later heirs would predict. Certainly, the late nineteenth and the early twentieth centuries saw the concretization of a particular form of Marxism in a political society, not merely in the former USSR but also in the various workers' movements in Europe and elsewhere, as well as in the founding of the International, which would raise these questions. A kind of

critical theory found its apologists from Engels to Lenin, from Bernstein to Luxemburg, from Kautsky to Plekhanov. Yet the systematization of critical theory as a model of reflection owes its life in the twentieth century to a group of academics who, originally inspired by the German workers' movement, attempted to give to critical theory a life in the German university.

FROM GRÜNBURG TO HORKHEIMER: THE FOUNDATION OF CRITICAL THEORY

Although the term 'critical theory' in the twentieth century owes its definition primarily to an essay written in 1937 by Max Horkheimer,[7] the institute which became associated with this term was founded almost two decades earlier. Certainly one of the more interesting experiments in the history of German institutional thought began when Felix Weil, the son of a German exporter of grains from Argentina, convinced his father, Hermann, to provide an endowment which would enable a yearly income of DM 120,000 to establish, in the year 1922, an Institute for Social Research in affiliation with the University of Frankfurt. Weil, inspired by the workers' movement, and having written a thesis on socialism, wanted an institute which could deal directly with the problems of Marxism on a par equal to other established disciplines in the University. The first candidate for director, Kurt Albert Gerlach, who planned a series of inaugural lectures on socialism, anarchism and Marxism, died of diabetes before he could begin. His replacement, Karl Grünberg, a professor of law and political science from the University of Vienna, an avowed Marxist, who had begun in the year of 1909 an Archive for the History of Socialism and the Worker's Movement, was present at the official creation of the Institute on 3 February 1922. In his opening address, he indicated that Marxism would be the guiding principle of the Institute. And so it was for a decade. To be sure, it was the kind of Marxism that was still inspired by the nineteenth century, by the idea of the proletariat, by the workers' movement, by the example of the Soviet Union and the Marx-Engels Institute in Moscow, by the conception of Marxism as a kind of science which could penetrate heretofore unknown truths which had been obscured by so-called 'bourgeois' thought. Indeed, mocking Frankfurt students celebrated its orthodoxy by referring to it as 'Café Marx'.

Certainly, Marxism need not be vulgar to be orthodox. Academic problems which were standard fare for a now more or less established theoretical tradition were commonplace. Principal among them was the study of the workers' movement. Indeed, if Marxian class theory was correct, the proletariat were to bear the distinctive role of being those who were able to interpret history and bring about the transformation that such insight would sustain. *Praxis* would then be associated solely with their activity. From an epistemological point of view, the problem of the relation of theory to *praxis* would be revealed. As Lukács would later think, there would be a certain transparent identity between Marxian social theory and the activity of the working class. Hence, academic study of the working class would be the most appropriate, indeed, the most proper, subject of study for an institute which conceived itself in Marxist terms.

For the Institute for Social Research at that time, Marxism was conceived by analogy

to science. Hence, the original works of the Institute were associated with capitalist accumulation and economic planning, studies of the economy in China, agricultural relations in France, imperialism and, along with this, through close collaboration with the Soviet Union, the establishment of a collection of the unpublished works of Marx and Engels. However, it wasn't until the leadership passed from Grünberg to the more able hands of one of the young assistants at the institute, Max Horkheimer, in 1931, that the Institute was to make its mark through both productivity and scholarship. Although Horkheimer was never the believing Marxist Grünberg had been, certain events in Germany and the world would shape the Institute, distancing it from Marxian orthodoxy. The rise of fascism and the splintering of the workers' movement as well as the Stalinization of Russia would force the Institute to stray from the conventional Marxist wisdom about both theory and science as well as shake its confidence in the workers' movement.

During the 1930s, the roster of the institute would include Theodor Adorno, Leo Lowenthal, Erich Fromm, Fredrich Pollach, Herbert Marcuse, Walter Benjamin (indirectly though, since he never became a fully-fledged member) and others. Although each figure would eventually be known for independent work, and although certain members would break with the general orientation of the Institute, in retrospect what is somewhat amazing about this illustrious group of scholars was its concern for sharing a common theoretical programme under a distinctive directorship. Indeed, the two most powerful theoretical minds, Adorno (1903–69) and Horkheimer (1895–1973), continued to collaborate for their entire lifetimes. Also, it was during this period that the distinctive perspective with which this group came to be identified began to be developed. Modern critical theory can be dated from this period.

The problematic which sparked a critical theory of the modern form was the demise of the working class as an organ of appropriate revolutionary knowledge and action coupled with the rise of fascism and the emergence of Stalinization. Taken together, these events would de-couple the link between theory and revolutionary practice centred in the proletariat which had become commonplace in Marxian theory. What became apparent to Horkheimer and others at the Institute was that once this link was broken, essentially the link with a certain form of ideology, it would be necessary to forge a unique theoretical perspective in the context of modern thought in general and German thought in particular. It would not be enough either comfortably to study the workers' movement or to define Marxist science. The road upon which the Institute embarked would have to bear its own distinctive stamp and character. In brief, not only would this de-coupling give critical theory its peculiar dynamic for the 1930s but, as the torch was passed in the 1960s to a younger generation, this same thrust would give it definition. Hence, while Grünberg's Archive for the History of Socialism and the Workers' Movement would define the Institute in more traditional Marxian terms, the chief organ of the Institute under Horkheimer, *The Journal for Social Research,* would record a different purpose, namely the movement away from Marxian materialism. Writing in 1968 Jürgen Habermas would put it this way:

> Since the years after World War II the idea of the growing wretchedness of the workers, out of which Marx saw rebellion and revolution emerging as a

> transitional step to the reign of freedom, had for long periods become abstract and illusory, and at least as out of date as the ideologies despised by the young. The living conditions of laborers and employees at the time of *The Communist Manifesto* were the outcome of open oppression. Today they are instead motives for trade union organization and for discussion between dominant economic and political groups. The revolutionary thrust of the proletariat has long since become realistic action within the framework of society. In the minds of men at least, the proletariat has been integrated into society.
>
> (*Critical Theory* [8.104], vi)

Horkheimer's 1937 essay, 'Traditional and Critical Theory', which attempted to systematically define critical theory, does not begin by underlining an association with the Marxist heritage which still distinguished the Institute and journal with which it was associated. Rather the essay begins by trying to answer the more general question regarding theory *per se,* 'What is theory?' (*ibid.,* p. 188). In the traditional sense, theory is a kind of generalization based upon experience. From Descartes to Husserl theory has been so defined, argues Horkheimer. As such, however, theory traditionally defined has a peculiar kind of prejudice which favours the natural sciences. Horkheimer, reflecting the great Diltheyian distinction between *Geisteswissenschaften* (social sciences) and *Naturwissenschaften* (natural sciences) makes the appropriate criticism. Social science imitates natural science in its self-definition as theory. Put simply, the study of society must conform to the facts. But Horkheimer would argue that it is not quite so simple. Experience is said to conform to generalizations. The generalizations tend to conform to certain ideas present in the minds of the researchers. The danger is apparent: so defined, theory conforms to the ideas in the mind of the researcher and not to experience itself. The word for this phenomenon, derived from the development of the Marxist theoretical tradition following Lukács's famous characterization in 1934, is 'reification'. Horkheimer doesn't hesitate to use it. Regarding the development of theory he states, 'But the conception of theory was absolutized, as though it were grounded in the inner nature of knowledge as such, or justified in some other ahistorical way, and thus it became a reified ideological category' (*ibid.,* p. 194). Although various theoretical approaches would come close to breaking out of the ideological constraints which restricted them, theoretical approaches such as positivism, pragmatism, neo-Kantianism and phenomenology, Horkheimer would argue that they failed. Hence, all would be subject to the logico-mathematical prejudice which separates theoretical activity from actual life. The appropriate response to this dilemma is the development of a critical theory. 'In fact, however, the self-knowledge of present-day man is not a mathematical knowledge of nature which claims to be the eternal logos, but a critical theory of society as it is, a theory dominated at every turn by a concern for reasonable conditions of life' (*ibid.,* p. 199). Of course, the construction of a critical theory won't be easy. Interestingly enough, Horkheimer defines the problem epistemologically. 'What is needed is a radical reconsideration not of the scientist alone, but of the knowing individual as such' *(ibid.)*.

Horkheimer's decision to take critical theory in the direction of epistemology was not without significance. Critical theory, which had heretofore depended upon the Marxist tradition for its legitimation, would have to define itself by ever distancing itself from that

tradition. Indeed, one of the peculiar ironies resulting from this particular turn is that the very tradition out of which critical theory comes, namely Marxism, would itself fall under the distinction between traditional and critical theory. Ultimately, in many ways the Marxist tradition was as traditional as all the other traditions. But, of course, the 1937 essay fails to recognize this. Indeed, this dilemma of recognition would play itself out in the post-1937 period. This is the very irony of the systematization of critical theory. Equally, this epistemological turn would change permanently the distinction and approach of critical theory. As I suggested earlier, critical theory found its foundation in the transformative tradition in German thought as inspired by Hegel and Marx. Now, having embarked upon an epistemological route, it would find it necessary to draw upon the constitutive dimension of German thought. If one could not ground critical theory in Marxian orthodoxy, certainly the assumption behind the 1937 essay, it would be necessary to find the constitutive point of departure for critical theory in an analysis of knowledge as such. Unfortunately, Horkheimer was unprepared to follow his own unique insight. Instead, the constitutive elements of knowledge to which he refers are taken in a more or less unexamined form from the Marxian heritage. The distinction between individual and society, the concept of society as bourgeois, the idea that knowledge centres in production, the critique of the so-called liberal individual as autonomous, the primacy of the concept of history over logos—these so-called elements which are constitutive of a critical theory were part of the Marxist heritage.

Taken as a whole, 'Tradition and Critical Theory' is strongly influenced by the Hegelian-Marxist idea that the individual is alienated from society, that liberal thought obscures this alienation, and that the task of critical theory must be to overcome this alienation. Horkheimer put it this way,

> The separation between the individual and society in virtue of which the individual accepts as natural the limits prescribed for his activity is relativized in Critical Theory. The latter considers the overall framework which is conditioned by the blind interaction of individual activities (that is, the existent division of labour and class distinctions) to be a function which originates in human action and therefore is a possible object of painful decision and rational determination of goals.
>
> (*ibid.,* p. 207)

Horkheimer is vehement in his critique of the kind of thought that characterizes so-called 'bourgeois' individualism. For him, 'bourgeois thought' harbours a belief in an individual who is 'autonomous' believing that it, the autonomous ego, is the ground of reality. Horkheimer counters this view with another, reminiscent of the early Marx. 'Critical thinking is the function neither of the isolated individual nor a sum total of individuals. Its subject is rather a definite individual in his real relation to other individuals and groups, in his conflict with a particular class, and, finally, in the resultant web of relationships with the social totality and with nature' (*ibid.,* pp. 201–11).

Of course, this view is dangerously close to traditional Marxian class theory and Horkheimer knows it. After all, who is this 'definite individual' whose 'real relation' is to other individuals? Traditional Marxist theory answered, the proletariat. Horkheimer is

suspicious. ‘But it must be added that even the situation of the proleteriat is, in this society, no guarantee of correct knowledge’ (*ibid.,* p. 213). Horkheimer is hard pressed to find the appropriate replacement of the proletariat without falling back into what he called ‘bourgeois individualism’. He is doubtful of the proletariat’s ability somehow to ‘rise above…differentiation of social structure…imposed from above’. But if he wants to eliminate the proletariat as a source of truth or correct knowledge, he doesn’t quite do it. Indeed, the intellectual or critic can proclaim his or her identity with the proletariat. Horkheimer is not entirely without optimism. ‘The intellectual is satisfied to proclaim with relevant admiration the creative strength of the proletariat and finds satisfaction in adapting himself to it and canonizing it’ (*ibid.,* p. 214). Indeed, Horkheimer is optimistic about this identification. If, however, the theoretician and his specific object are seen as forming a dynamic unity with the oppressed class, so that his presentation of societal contradictions is not merely the expression of the concrete historical situation but also a force within it to stimulate change, then his real function emerges’ (*ibid.,* p. 215).

Horkheimer’s reliance on Marxian doctrine as the epistemological foundation for critical theory becomes more apparent as the essay develops. Hence, a critical theory of society will show ‘how an exchange economy, given the condition of men (which, of course, changes under the very influence of such an economy), must necessarily lead to a heightening of those social tensions which in the present historical era lead in turn to wars and revolution’ (*ibid.,* p. 266). As such, critical theory has a peculiar insight into the potential history of modern society. As Marx used political economy and the theory of the primacy of production, Horkheimer will use this model of economic determinism to predict the development of social contradictions in the modern world. Indeed, he goes as far as to state that critical theory rests upon a ‘single existential judgment’, namely, ‘the basic form of the historically given commodity economy, on which modern history rests, contains in itself the internal and external tensions of the modern era’ (*ibid.,* p. 227).

Equally, critical theory will be able to overcome the ‘Cartesian dualism’ that characterized contemporary traditional theory by linking critical with practical activity, theory and *praxis*. Indeed, it was this belief that critical theory was somehow related to practical activity that would distinguish this kind of theoretical endeavour. ‘The thinker must relate all the theories which are proposed to the practical attitudes and social strata which they reflect’ (*ibid.,* p. 232).

In retrospect, one may view this 1937 declaration as something of a *tour de force* attempting to break away from at least some of the most fundamental tenets of traditional Marxist theory, while at the same time in a curious way being caught in the very web of the system from which it was trying to escape. Hence, while dissociating itself from the assumption that truth and proper knowledge were to be rendered through the proletariat, the fundamental tenet of Marxian class theory, this treatise on critical theory celebrated concepts such as economic determinism, reification, critique of autonomy and social contradiction—assumptions derived from traditional Marxian social theory—as valid notions. Simultaneously, this position could not seek to justify itself independently of the events of the time. As the French Revolution determined Hegel’s concept of the political end of philosophy as human freedom, and as the burgeoning Industrial Revolution determined Marx’s thought, critical theory attempted to respond to the events of the time, the decline of the workers’ movement and the rise of fascism. Hence, the indelible mark

of the Institute, and of the essay on critical theory in the decade of the 1930s, was the conviction that thought was linked to social justice. The thesis, as old as the German Enlightenment itself, was that thought could somehow be emancipatory. The predominance of this view gave the Institute its particular character, especially when contrasted to the other German philosophical movements of the time, phenomenology, existentialism and, to some extent, positivism. Although influenced by the same set of events as the other German philosophical movements it was critical theory that was to distinguish itself by addressing the political oppression of the day.

HORKHEIMER, ADORNO, AND THE DIALECTICAL TRANSFORMATION OF CRITICAL THEORY

Critical theory in the post-1937 period would be characterized by two essentially related perspectives, one which broadened its critique of modes of rationality under the heading 'critique of instrumental reason' and the other which attempted a grand analysis of culture and civilization under the heading 'dialectic of enlightenment'. With the onslaught of the Second World War, Horkheimer and Adorno shared not only a deep pessimism about the future course of rationality but also a loss of hope in the potentialities of a philosophy of history for purposes of social transformation. The confidence in the great potentialities of thought as unleashed by the German Enlightenment went underground, replaced by the pessimism of the two major thinkers of critical theory who gave up not only on being thinkers in solidarity with the proletariat but also on the redemptive powers of rationality itself. In this sense, not only do they represent a critique of what is now quite fashionably called 'modernity', but they may be the harbingers of postmodernity as well.

In the course of the development of critical theory under the ever more pessimistic vision of its principal representatives, the focus would change from Hegel and Marx to Weber. Although they were never to give up entirely on Hegel and Marx, it was Weber who would articulate the pessimistic underside of the Enlightenment which Horkheimer and Adorno would come to admire. Hegel, through his notion of reflection which made a distinction between true and false forms of externalization, between *Entaüsserung* and *Entfremdung,* always sustained the possiblity of reason being able to overcome its falsifications. Marx, although less attentive to this distinction, retained the possibility of overcoming falsification or alienation through social action. Hence, whether it was through the reconciliatory power of reason in the case of Hegel, or the transformative force of social action in the case of Marx, a certain emancipatory project was held intact. Horkheimer, and eventually Adorno, initially endorsed that project. However, when Horkheimer wrote his *Critique of Instrumental Reason* [8.105] it was under the influence of Weber's brilliant, sobering vision regarding reason and action forged through a comprehensive analysis of the genesis and development of western society. Weber had speculated that in the course of western history, reason, as it secularizes, frees itself from its more mythic and religious sources and becomes ever more purposive, more oriented to means to the exclusion of ends. In order to characterize this development, Weber coined the term *Zweckrationalität,* purposive-rational action. Reason, devoid of its redemptive

and reconciliatory possibilities, could only be purposive, useful and calculating. Weber had used the metaphor 'iron cage' as an appropriate way of designating the end, the dead-end of modern reason. Horkheimer would take the analysis one step further. His characterization of this course was designated by the term, 'instrumental reason'. Implied in this usage is the overwhelming force of reason for purposes of social control. The combined forces of media, bureaucracy, economy and cultural life would bear down on the modern individual with an accumulated force which could be described only as instrumental. Instrumental reason would represent the ever-expanding ability of those who were in positions of power in the modern world to dominate and control society for their own calculating purposes. So conceived, the kind of analysis which began with the great optimism inaugurated by the German Enlightenment (which sustained the belief that reason could come to comprehend the developing principle of history and therefore society) would end with the pessimistic realization that reason functions for social control, not in the name of enlightenment or emancipation. And what then of a critical theory?

No doubt that question occurred to Horkheimer and Adorno, who, as exiles, now southern Californians, collaborated on what in retrospect must be said to be one of the most fascinating books of modern times, *Dialectic of Enlightenment*. Is enlightenment, the avowed aim of a critical theory, 'self-destructive'? That is the question posed by the book, the thesis of which is contained in its title. Enlightenment, which harbours the very promise of human emancipation, becomes the principle of domination, domination of nature and thus, in certain hands, the basis for the domination of other human beings. In the modern world, knowledge is power. The book begins with an analysis of Bacon's so-called 'scientific attitude'. The relation of 'mind' and 'nature' is 'patriarchal' (*ibid.,* p. 4); 'the human mind, which overcomes superstition, is to hold sway over a disenchanted nature' *(ibid.)*. 'What men want to learn from nature is how to use it in order wholly to dominate it and other men. That is the only aim' *(ibid.)*. Hence, 'power and knowledge' are the same. But the thesis is more complex. The term 'dialectic' is used here in a form which transcends Hegel's quasi-logical usage. Here dialectic circles back upon itself in such a manner that its subject, enlightenment, both illuminates and destroys. Myth is transformed into enlightenment, but at the price of transforming 'nature into mere objectivity' (*ibid.,* p. 9). The increment of power gained with enlightenment has as its equivalent a simultaneous alienation from nature. The circle is vicious: the greater enlightenment, the greater alienation. Magic, with its desire to control, is replaced by science in the modern world, which has not only the same end but more effective means. According to this thesis, the very inner core of myth is enlightenment. 'The principle of immanence, the explanation of every event as repetition, that the enlightenment upholds against mythic imagination, is the principle of myth itself' (*ibid.,* p. 12). Indeed, they observe, in the modern obsession with the mathematization of nature (the phenomenon so accurately observed by Edmund Husserl in his famous *The Crisis of European Science and Transcendental Phenomenology*) they find representatives of a kind of 'return of the mythic' in the sense that enlightenment always 'intends to secure itself against the return of the mythic'. But it does so by degenerating into the 'mythic cult of positivism'. In this 'mathematical formalism', they claim, 'enlightenment returns to mythology, which it never knew how to elude' (*ibid.,* p. 27). Such is the peculiar character of the dialectic of

enlightenment, which turns upon itself in such a way that it is subsumed by the very phenomenon it wishes to overcome.

Critical theory distinguishes itself in this period by ever distancing itself from the Marxian heritage with which it originally associated. Some would see this as a departure from the very sources of reason from which it was so effectively nourished. Hence, a form of rationality gone wild. Others might see it from a different perspective. Perhaps the *Dialectic of Enlightenment* represents the coming of age of critical theory as critical theory finally making the turn into the twentieth century. As such, the philosophy of history on which it so comfortably rested, with its secure assumptions about the place of enlightenment in the course of western history (to say nothing of the evolution of class and economy), was undercut by the authors' curious insight into the nature of enlightenment itself. Enlightenment is not necessarily a temporal phenomenon given its claims for a particular time and place in modern historical development. Rather, for Horkheimer and Adorno, enlightenment is itself dialectical, a curious phenomenon associated with rationality itself. In this view, the dialectic of enlightenment could be traced to the dawn of human civilization. Here we encounter a form of critical theory influenced not only by Kant, Hegel, Marx and Weber but also by Nietzsche and perhaps Kierkegaard. It would follow that texts that witnessed the evolution of human history would be placed side by side with those which gave testimony to its origin. Enlightenment can then be traced not to the so-called German Enlightenment, or to the western European Enlightenment, but to the original written texts of western civilization, which, as any former Gymnasium student knows, were those of Homer. Nietzsche is credited with the insight. 'Nietzsche was one of the few after Hegel who recognized the dialectic of enlightenment' (*ibid.,* p. 44). They credit him with the double insight that while enlightenment unmasks the acts of those who govern, it is also a tool they use under the name of progress to dupe the masses. 'The revelation of these two aspects of the Enlightenment as an historic principle made it possible to trace the notion of enlightenment as progressive thought, back to the beginning of traditional history' *(ibid.)*.

Horkheimer and Adorno do not concentrate much on the illusory character of the enlightenment in Homer, 'the basic text of European civilization' as they call it. That element has been over-emphasized by the so-called fascist interpreters of both Homer and Nietzsche. Rather, it is the use or interpretation of myth as an instrument of domination as evidenced in this classic text that they perceive as fundamental. Here, Weber and Nietzsche complement one another. The other side of the dialectic of enlightenment is the thesis on instrumental reason. Hence, the 'individuation' of self which is witnessed in the Homeric text is carried out through what seems to be the opposition of enlightenment and myth. 'The opposition of enlightenment to myth is expressed in the opposition of the surviving individual ego to multifarious fate' (*ibid.,* p. 46). The Homeric narrative secularizes the mythic past in the name of the hero's steadfast orientation to his own 'self-preservation'. It secularizes it by learning to dominate it. Learning to dominate has to do with the 'organization' of the self. But the very instrumentality associated with domination has its curious reverse side; something like that which Marcuse would later call 'the return of the repressed'. As they put it regarding Homer, 'Like the heroes of all the true novels later on, Odysseus loses himself in order to find himself; the estrangement from nature that he brings about is realized in the process of the abandonment to nature

he contends in each adventure; and, ironically, when he, inexorably, returns home, the inexorable force he commands itself triumphs as the judge and avenger of the legacy of the powers from which he has escaped' (*ibid.,* p. 48).

There is no place where this curious double thesis is more effectively borne out than in the phenomenon of sacrifice. Influenced by Ludwig Klage's contention regarding the universality of sacrifice, they observe that individuation undercuts the originary relation of the lunar being to nature which sacrifice implies. 'The establishment of the self cuts through that fluctuating relation with nature that the sacrifice of the self claims to establish' (*ibid.,* p. 51). Sacrifice, irrational though it may be, is a kind of enabling device which allows one to tolerate life. 'The venerable belief in sacrifice, however is probably already an impressed pattern according to which the subjected repeat upon themselves the injustice that was done them, enacting it again and again in order to endure it' *(ibid.)*. Sacrifice, when universalized and said to apply to the experience of all of humanity, is civilization. Its elimination would occur at enormous expense. The emergence of rationality is based on denial, the denial of the relationship between humanity and nature. 'The very denial, the nucleus of all civilizing rationality, is the germ cell of a proliferating mythic irrationality: with the denial of nature in man not merely the *telos* of the outward control of nature but the *telos* of man's own life is distorted and befogged' (*ibid.,* p. 54). The great loss is of course that the human being is no longer able to perceive its relationship to nature in its compulsive preoccupation with self-preservation. The dialectic of enlightenment continues to play itself out. To escape from sacrifice is to sacrifice oneself. Hence the subthesis of *Dialectic of Enlightenment:* 'the history of civilization is the history of the introversion of sacrifice. In other words, the history of renunciation' (*ibid.,* p. 55). It is this sub-thesis that they associate with the 'prehistory of subjectivity' (*ibid.,* p. 54).

The text to which Horkheimer and Adorno have turned their attention is written by Homer, but the story is about the prehistory of western civilization. Odysseus is the prophetic seer who in his deeds would inform the course of action to be followed by future individuals. Odysseus is the 'self who always restrains himself, he sacrifices for the 'abnegation of sacrifice' and through him we witness the 'transformation of sacrifice into subjectivity'. Above all, Odysseus 'survives', but ironically at the 'concession of one's own defeat', an acknowledgement of death. Indeed, the rationality represented by Odysseus is that of 'cunning': a necessity required by having to choose the only route between Scylla and Charybdis in which each god has the 'right' to do its particular task. Together the gods represent 'Olympian Justice' characterized by an 'equivalence between the course, the crime which expiates it, and the guilt arising from that, which in turn reproduces the curse' (*ibid.,* p. 58). This is the pattern of 'all justice in history' which Odysseus opposes. But he does so by succumbing to the power of this justice. He does not find a way to escape the route charted past the Sirens. Instead, he finds a way to outwit the curse by having himself chained to the mast. As one moves from myth to enlightenment, it is cunning with its associated renunciation which characterizes reason. The great promise held by enlightenment is now seen when perceived in retrospect from the perspective of the earlier Horkheimer and Adorno to be domination, repression and cunning.

The thesis contained in *Dialectic of Enlightenment* can be extended beyond the origin

of western civilization. As its authors attempt to show, it can be brought back to critique effectively the eighteenth-century Enlightenment as well as attempts to overcome it. As self-preservation was barely seen in Homer as the object of reason, the so-called historical Enlightenment made a fetish of it. 'The system the Enlightenment has in mind is the form of knowledge which copes most proficiently with the facts and supports the individual most effectively in the mastery of nature. Its principles are the principles of self-preservation.' 'Burgher', 'slave owner', 'free entrepreneur' and 'adminstrator' are its logical subjects. At its best, as represented in Kant, reason was suspended between 'true universality' in which 'universal subjects' can 'overcome the conflict between pure and empirical reason in the conscious solidarity of the whole' (*ibid.,* p. 83), and calculating rationality 'which adjusts the world for the ends of self-preservation'. In this view, Kant's attempts to ground morality in the law of reason came to naught. In fact, Horkheimer and Adorno find more base reasons for Kant's attempt to ground morality in the concept of 'respect'. 'The root of Kantian optimism' is based in this view on the fear of a retreat of 'barbarism'. In any case, in this view the concept of respect was linked to the bourgeois which in latter times no longer existed in the same way. Totalitarianism as represented in fascism no longer needed such concepts nor did it respect the class that harboured them. It would be happy with science as calculation under the banner of self-preservation alone. The link between Kant and Nietzsche is said to be the Marquis de Sade. In Sade's writings, it is argued, we find the triumph of calculating reason, totally individualized, freed from the observation of 'another person'. Here, we encounter a kind of modern reason deprived of any 'substantial goal', 'wholly functionalized', a 'purposeless purposiveness' totally unconcerned about effects which are dismissed as 'purely natural'. Hence, any social arrangement is as good as any other and the 'social necessities' including 'all solidarity with society duty and family' can be dissolved.

If anything, then, enlightenment means 'mass deception' through its fundamental medium of the 'culture industry' where the rationality of 'technology' reigns. 'A technological rationale is the rationale of domination itself (*ibid.,* p. 121). In film, in music, in art, in leisure this new technology has come to dominate in such a way that the totality of life and experience have been overcome. In the end, in accord with this view, the so-called enlightenment of modern civilization is ironic, total, bitter and universal. Enlightenment as self-deception manifests itself when art and advertising become fused in an idiom of a 'style' that fashions the modern experience as an ideology from which there is no escape. In the blur of modern images, all phenomena are exchangeable. Any object can be exchanged for any other in this 'superstitious fusion of word and thing' (*ibid.,* p. 164). In such a world, fascism becomes entertainment, easily reconciled with all the other words and images and ideologies in the vast arena of modern assimilation.

In the end, *Dialectic of Enlightenment* can be viewed as a kind of crossroads for modern philosophy and social theory. On the one hand, reason can function critically, but on the other, it cannot ground itself in any one perspective. Reason under the image of self-preservation can only function for the purpose of domination. This is critical theory twice removed; removed from its foundations in the Marxism of the nineteenth century from which it attempted to establish its own independence, and removed once again from any foundation to function as a raging power of critique without foundation. In this sense,

this book, more than any other to come from the so-called Frankfurt school, hailed the end of philosophy, and did so in part to usher in the era now designated as postmodernity. Thus, it was not only to the successive reconstruction of phenomenology from Husserl through Heidegger that the harbingers of postmodernity could point as legitimate forebears of their own movement, but to the voices which rang out in the *Dialectic of Enlightenment* whose prophetic rage led the way. It was left to Foucault to probe the multiple meanings of the discipline of the self and the institutional repression of the subject unleashed by the Enlightenment, and to Derrick to articulate the groundlessness of a position which seeks the role of critic but cannot find the way to a privileged perspective which would make possible the proper interpretation.

ADORNO AND THE AESTHETIC REHABILITATION OF CRITICAL THEORY

But if critical theory was willing in the late 1940s to give up partially on the Enlightenment and the possibility of a modality of thought that harboured within it a potential for emancipation, it was not totally ready to do so. Hence, critical theory in its curious route from the early 1920s to the present would make one more turn, a turn toward aesthetics. The wager on aesthetics would keep alive, if in muted fashion, the emancipatory hypothesis with which critical theory began. Adorno, inspired in part by Benjamin, would lead the way out from the ashes left in the wake of an instrumental rationality whose end, as the end of philosophy, was almost apparent. If the general claims of the *Dialectic of Enlightenment* were to be sustained, the theoretical consequences for critical theory would be devastating. Hence the question regarding the manner in which a critical theory could be rehabilitated, but this time under the suspicion of a full-blown theory of rationality. In a sense, through Horkheimer's and Adorno's rather devastating analysis of rationality as fundamentally instrumental, and of enlightenment as fundamentally circular, it would have seemed that the very possibility for critique itself would be undermined. The aesthetic redemption of the claims of critical theory would have to be understood from the perspective of the framework of suspicion regarding the claims of cognition. Since cognition would result inevitably in instrumentality, it would be necessary to find a way in which critique could be legitimated without reference to cognition *per se*. Aesthetics, with which Adorno had been fascinated from the time of his earliest published work, would provide a way out. If *Dialectic of Enlightenment* could be read as a critique of cognition, art represents for Adorno a way of overcoming the dilemma established by cognition. Adorno sees the capacity of a non-representational theory in the potentiality of art as manifestation. The explosive power of art remains in its representing that which cannot be represented. In this sense it is the nonidentical in art that can represent society, but only as its other. Art functions then for Adorno in the context of the programme of critical theory as a kind of stand-in for a cognitive theory, which cannot be attained under the force of instrumentality.

Adorno, however, was not quite ready to give up on a philosophy of history which had informed his earlier work. Hence, under the influence of Benjamin and in direct contrast

to Nietzsche and Heidegger, he was able to incorporate his understanding of art within a theory of progress. At the end of his famous essay 'The Work of Art in the Age of Mechanical Reproduction',[8] originally published in the *Zeitschrift für Sozialforschung* in 1936,[9] Benjamin has postulated the thesis that with photography, 'for the first time in world history, mechanical reproduction emancipates the work of art from its parasitical dependence on ritual'. As a consequence, art no longer needed to sustain a claim on authenticity. After photography, the work of art is 'designed for reproducibility'. From this observation, Benjamin drew a rather astonishing conclusion: 'But the instant the criterion of authenticity ceases to be applicable to artistic production, the total function of art is reversed. Instead of being based on ritual, it begins to be based on another practice—politics' (*ibid.,* p. 244). However, it should not be assumed that the politics with which modern an was to be associated was immediately emancipatory. The thesis was as positive as it was negative. 'The logical result of Fascism is the introduction of aesthetics into political life' (*ibid.,* p. 241). But for Benjamin this was a form of the relationship between aesthetics and politics which would attempt to rekindle the old association between art and ritual. 'The violation of the masses, whom Fascism, with it the Führer cult, forces to their knees, has its counterpart in the violation of an apparatus which is pressed into the production of ritual values' *(ibid.)*. However, the tables can be turned; while fascism 'equals the aestheticism of politics', Benjamin claimed, Marxist as he was, that 'communism responds to politicizing art' (*ibid.,* p. 242).

Adorno would use this insight into the nature of art and historical development freed of Benjamin's somewhat materialist orientation. While he affirmed that 'modern art is different from all previous art in that its mode of negation is different' because modernism 'negates tradition itself, Adorno addressed the issue of the relation of art not to fascism but to capitalist society. Beyond that, Adorno's task was to show how art could overcome the dilemma of rationality as defined through the critique of instrumentality, while at the same time sustaining the claim that art had a kind of intelligibility. How could art be something other than a simple representation of that society? Adorno would return to the classical aesthetic idea of mimesis in order to make his point. Art has the capacity to represent, but in its very representation it can transcend that which it is representing. Art survives not by denying but by reconstructing. 'The modernity of art lies in its mimetic relation to a petrified and alienated reality. This, and not the denial of that mute reality, is what makes art speak' (*Aesthetic Theory* [8.23], 31). Art, in other words, represents the non-identical. 'Modern art is constantly practicing the impossible trick of trying to identify the non-identical' *(ibid.)*.

Art then can be used to make a kind of claim about rationality. 'Art's disavowal of magical practices—art's own antecedents—signifies that art shares in rationality. Its ability to hold its own *qua* mimesis in the midst of rationality, even while using the means of that rationality, is a response to the evils and irrationality of the bureaucratic world.' Art then is a kind of rationality that contains a certain 'non-rational' element that eludes the instrumental form. This would suggest that it is within the power of art to go beyond instrumental rationality. This is what art can do which cannot be done in capitalist society *per se*. 'Capitalist society hides and disavows precisely this irrationality, whereas art does not.' Art then can be related to truth. Art 'represents truth in the twofold sense of preserving the image of an end smothered completely by rationality and of

exposing the irrationality and absurdity of the status quo' (*ibid.,* p. 79).

It is Adorno's claim then that although art may be part and parcel of what Weber described as rationalization, that process of rationalization in which art partakes is not one which leads to domination. Thus, if art is part of what Weber called the 'disenchantment of the world', it leads us in a direction different from that of instrumental reason. Hence, the claim that 'Art mobilizes technology in a different direction than domination does' (*ibid.,* p. 80). And it is for this reason, thinks Adorno, that we must pay attention to the 'dialectics of mimesis and rationality that is intrinsic to art' *(ibid.)*.

Whereas the *Dialectic of Enlightenment* could be conceived as a critique of cognition, Adorno uses art to rehabilitate a cognitive claim. 'The continued existence of mimesis, understood as the non-conceptual affinity of a subjective creation with its objective and unposited other, defines art as a form of cognition and to that extent as "rational"' *(ibid.)*. Hence, in a time when reason has, in Adorno's view, degenerated to the level of instrumentality, one can turn to art as the expression of the rehabilitation of a form of rationality which can overcome the limitation of reason by expressing its non-identity with itself. In this sense, the claims of critical theory would not be lost but be transformed. Indeed, the earlier emancipatory claims of critical theory would be reappropriated at another level. Here again, Adorno's view seems to be shaped by that of his friend Walter Benjamin. Art can reconcile us to the suffering which can never be expressed in ordinary rational terms. While 'reason can subsume suffering under concepts' and while it can 'furnish means to alleviate suffering', it can never 'express suffering in the medium of experience'. Hence, art has a unique role to play under a transformed understanding, i.e., the role of critical theory. 'What recommends itself, then, is the idea that art may be the only remaining medium of truth in an age of incomprehensible terror and suffering' (*ibid.,* p. 27). In other words, art can anticipate emancipation, but only on the basis of a solidarity with the current state of human existence. 'By cathecting the repressed, art internalizes the repressing principle, i.e. the unredeemed condition of the world, instead of merely airing futile protests against it. Art identifies and expresses that condition, thus anticipating its overcoming' (*ibid.,* p. 26). For Benjamin it was this view of and solidarity with suffering experienced by others in the past which has not been redeemed. For him then, happiness is not simply an empty Enlightenment term. It has a slightly messianic, theological twist. His fundamental thesis was 'Our image of happiness is indissolubly bound up with the image of redemption' (*ibid.,* p. 254).

Finally, if it is possible to look at Adorno's later work on aesthetics from the perspective of the position worked out with Horkheimer in *Dialectic of Enlightenment,* it appears that a case can be made for the retrieval of the earlier emancipatory claims of critical theory on the basis of the non-identical character of the work of art. To be sure, Adorno, along with Horkheimer, had left little room to retrieve a critical theory in the wake of their devastating critique of the claims of reason. Indeed, the claims for art would have to be measured against this very critique. Yet, in a peculiar way, Adorno was consistent with the prior analysis. If reason would always lead to domination, then art would have to base its claim on its ability to express the non-identical. However, the task remained to articulate those claims precisely. In order to do so Adorno would often find

himself falling back on a philosophy of history which, by the standards articulated in his earlier critique, he had already invalidated.

HABERMAS AND THE RATIONAL RECONSTRUCTION OF CRITICAL THEORY

With Jürgen Habermas, Adorno's one-time student, the discourse over the rehabilitation of critical theory was taken to a higher level. Habermas's initial strategy was to rehabilitate the notion of critique in critical theory. Clearly, Habermas has long-held doubts about the way in which his philosophical mentors in Frankfurt failed to ground a critical theory in a theory of rationality which would harbour an adequate notion of critique. On this he has written eloquently in both *The Theory of Communicative Action* (1981, [8.85]) and *The Philosophical Discourse of Modernity* (1985, [8.88]). What I have found interesting in studying the works of Habermas is the manner in which the argument for a critical theory of rationality began to take shape as an alternative argument to the one which Horkheimer and Adorno put forth. In this context, Habermas would avail himself of certain resources within the tradition of contemporary German philosophy which his mentors overlooked. I suggested earlier that German philosophy since Kant has been shaped by the interaction between the themes of constitution and transformation. If modern critical theory began with a relatively firm belief that the grounds for the emancipatory assumptions regarding critique were clear and given in a certain orientation toward theory, in retrospect that foundation became ever less secure. Eventually, critique, as in *Dialectic of Enlightenment,* became caught in a never-ending circle of internal repression and external domination. Hence, the promise of critical theory had been undermined. It was the great merit of Habermas's early work to have seen the dilemma and to have addressed it in terms of turning not to the transformative but to the constitutive element in the German philosophical tradition. Critical theory was for Habermas, at least originally, the problem of 'valid knowledge', i.e., an epistemological problem.

It should come as no surprise then that when Habermas first juxtaposes traditional and critical theory, following in the footsteps of Horkheimer's 1937 article, he engages Edmund Husserl not only on the status of theory but also on the nature of science. By so doing, he appropriates two of the themes that were germane and of a piece in late transcendental phenomenology, namely, the association of the concept of theory with a more or less political notion of liberation or emancipation and the preoccupation of phenomenology with the status of science.

As early as the writing of *Knowledge and Human Interests* (1969, [8.82]), Habermas sustained the thesis that critical theory could be legitimated on the basis of making apparent the undisclosed association between knowledge and interest. This association, however, could be specified only on the basis of the clarification of theory in its more classical form. According to Habermas *theoria* was a kind of mimesis in the sense that in the contemplation of the cosmos one reproduces internally what one perceives externally. Theory then, even in its traditional form, is conceived to be related to the 'conduct of one's life'. In fact, in this interpretation of the traditional view, the appropriation of a

theoretical attitude creates a certain ethos among its practitioners. Husserl is said to have sustained this 'traditional' notion of theory. Hence, when Husserl approached the question of science he approached it on the basis of his prior commitment to the classical understanding of theory.

In Habermas's view, it is this commitment to theory in the classical sense which determines Husserl's critique of science. Husserl's attack on the objectivism of the sciences led to the claim that knowledge of the objective world has a 'transcendental' basis in the pre-scientific world, that sciences, because of their prior commitment to mundane knowledge of the world, are unable to free themselves from interest, and that phenomenology, through its method of transcendental self-reflection, can free this association of knowledge and mundane interest through a commitment to a theoretical attitude which has been defined traditionally. In this view, the classical conception of theory, which phenomenology borrows, frees one from interest in the ordinary world with the result that a certain 'therapeutic power', as well as a 'practical efficacy', is claimed for phenomenology.

Habermas endorses Husserl's procedure, while at the same time pointing out its error. Husserl is said to be correct in his critique of science, which, because of its 'objectivist illusion', embedded in a belief in a 'reality-in-itself', leaves the matter of the constitution of these facts undisclosed with the result that it is unaware of the connection between knowledge and interest. In Husserl's view, phenomenology, which makes this clear, can rightfully claim for itself, against the pretensions of the sciences, the designation 'pure theory'. Precisely here Husserl would bring the practical efficacy of phenomenology to bear. Phenomenology would be said to free one from the ordinary scientific attitude. But phenomenology is in error because of its blind acceptance of the implicit ontology present in the classical definition of theory. Theory in its classical form was thought to find in the structure of the 'ideal world' a prototype for the order of the human world. Habermas says in a rather insightful manner, 'Only as cosmology was *theoria* also capable of orienting human action' ([8.82], 306). If that is the case, then the phenomenological method which relied on the classical concept of theory was to have a certain 'practical efficacy', which was interpreted to mean that a certain 'pseudonormative power' could be derived from the 'concealment of its actual interest'.

In the end, phenomenology, which sought to justify itself on the basis of its freedom from interest, has instead an undisclosed interest which it derived from a classical ontology. Habermas believes classical ontology in turn can be characterized historically. In fact, the concept of theory is said to be derived from a particular stage in human emancipation where *catharsis,* which had been engendered heretofore by the 'mystery cults', was now taken into the realm of human action by means of 'theory'. This in turn would mark a new stage, but certainly not the last stage, in the development of human 'identity'. At this stage, individual identity could be achieved only through the indentification with the 'abstract laws of cosmic order'. Hence, theory represents the achievements of a consciousness that is emancipated, but not totally. It is emancipated from certain 'archaic powers', but it still requires a certain relationship to the cosmos in order to achieve its identity. Equally, although pure theory could be characterized as an 'illusion', it was conceived as a 'protection' from 'regression to an earlier stage'. And here we encounter the major point of Habermas's critique, namely, the association of the

contemplative attitude, which portends to dissociate itself from any interest, and the contradictory assumption that the quest for pure knowledge is conducted in the name of a certain practical interest, namely, the emancipation from an earlier stage of human development.

The conclusion is that both Husserl and the sciences he critiques are wrong. Husserl is wrong because he believes that the move to pure theory is a step which frees knowledge from interest. In fact, as we have seen, the redeeming aspect of Husserl's phenomenology is that it does in fact have a practical intent. The sciences are wrong because although they assume the purely contemplative attitude, they use that aspect of the classical concept of theory for their own purposes. In other words, the sciences use the classical concept of pure theory to sustain an insular form of positivism while they cast off the 'practical content' of that pure theory. As a consequence, they assume that their interest remains undisclosed.

Significantly, when Habermas turns to his critique of science, he sides with Husserl. This means that Husserl has rightly critiqued the false scientific assumption that 'theoretical propositions' are to be correlated with 'matters of fact', an 'attitude' which assumes the 'self-existence' of 'empirical variables' as they are represented in 'theoretical propositions'. But not only has Husserl made the proper distinction between the theoretical and the empirical, he has appropriately shown that the scientific attitude 'suppresses the transcendental framework that is the precondition of the meaning of the validity of such propositions' (*ibid.,* p. 307). It would follow, then, that if the proper distinction were made between the empirical and the theoretical and if the transcendental framework were made manifest, which would expose the meaning of such propositions, then the 'objectivist illusion' would 'dissolve' and 'knowledge constitutive' interests would be made 'visible'. It would follow that there is nothing wrong with the theoretical attitude as long as it is united with its practical intent and there is nothing wrong with the introduction of a transcendental framework, as long as it makes apparent the heretofore undisclosed unity of knowledge and interest.

What is interesting about this analysis is that the framework for the notion of critique is not to be derived from dialectical reason as Horkheimer originally thought but from transcendental phenomenology. One must be careful here. I do not wish to claim that Habermas identifies his position with Husserl. Rather, it can be demonstrated that he derives his position on critique from a critique of transcendental phenomenology. As such, he borrows both the transcendental frame-work for critique and the emphasis on theory as distinguished from empirical fact that was established by Husserl. Therefore, at that point he argues for a 'critical social science' which relies on a 'concept of self-reflection' which can 'determine the meaning of the validity of critical propositions'. Such a conception of critical theory borrows from the critique of traditional theory the idea of an 'emancipatory cognitive interest' which, when properly demythologized, is based not on an emancipation from a mystical notion of universal powers of control but rather from a more modern interest in 'autonomy and responsibility'. This latter interest will appear later in his thought as the basis for moral theory.

On the basis of this analysis, one might make some observations. Clearly, from the point of view of the development of critical theory, Habermas rightfully saw the necessity of rescuing the concept of critique. Implicit in that attempt is not only the rejection of

Dialectic of Enlightenment but also Adorno's attempt to rehabilitate critical theory on the basis of aesthetics. However—and there is considerable evidence to support this assumption—the concept of critical theory which had informed Horkheimer's early essay on that topic had fallen on hard times. As the members of the Institute for Social Research gradually withdrew from the Marxism that had originally informed their concept of critique, so the foundations upon which critical theory was built began to crumble. Habermas's reconceptualization of the notion of critique was obviously both innovative and original. It was also controversial. Critique would not be derived from a philosophy of history based on struggle but from a moment of self-reflection based on a theory of rationality. As Habermas's position developed it is that self-reflective moment which would prove to be interesting.

HABERMAS: CRITIQUE AND VALIDITY

Critique, which was rendered through the unmasking of an emancipatory interest *vis-à-vis* the introduction of a transcendentalized moment of self-reflection, re-emerges in the later, as opposed to the earlier, works of Habermas at the level of validity. The link between validity and critique can be established through the transcendentalized moment of self-reflection which was associated with making apparent an interest in autonomy and responsibility. Later, that moment was transformed through a theory of communicative rationality to be directed to issues of consensus. Validity refers to a certain background consensus which can be attained through a process of idealization. As critique was originally intended to dissociate truth from ideology, validity distinguished between that which can be justified and that which cannot. Hence, it readdresses the claims for autonomy and responsibility at the level of communication. It could be said that the quest for validity is superimposed upon the quest for emancipation. There are those who would argue that moral theory which finds its basis in communicative action has replaced the older critical theory with which Habermas was preoccupied in *Knowledge and Human Interests*. I would argue somewhat differently that Habermas's more recent discourse theory of ethics and law is based on the reconstructed claims of a certain version of critical theory.

However, before justifying this claim, I will turn to the basic paradigm shift in Habermas's work from the philosophy of the subject to the philosophy of language involving construction of a theory of communicative action on the one hand and the justification of a philosophical postion anchored in modernity on the other. Both moves can be referenced to the debate between earlier and later critical theory.

If Horkheimer's, and later Adorno's, concept of 'instrumental rationality' is but a reconstruction of Max Weber's concept of purposiverational action, it would follow that a comprehensive critique of that view could be directed to Weber's theory of rationalization. In Habermas's book, *The Theory of Communicative Action,* it is this theory that is under investigation as seen through the paradigm of the philosophy of consciousness. Weber's thesis can be stated quite simply: if western rationality has been reduced to its instrumental core, then it has no further prospects for regenerating itself. Habermas wants to argue that the failure of Weber's analysis, and by implication the

failure of those like Horkheimer and Adorno who accepted Weber's thesis, was to conceive of processes of rationalization in terms of subject-object relations. In other words, Weber's analysis cannot be dissociated from Weber's theory of rationality. According to this analysis, his theory of rationality caused him to conceive of things in terms of subject-object relations. Habermas's thesis, against Weber, Horkheimer and Adorno, is that a theory of rationality which conceives of things in terms of subject-object relations cannot conceive of those phenomena in other than instrumental terms. In other words, all subject-object formulations are instrumental. Hence, if one were to construct a theory of rationalization in non-instrumental terms, it would be necessary to construct an alternative theory of rationality. The construction of a theory of communicative action based on a philosophy of language rests on this assumption.

In Habermas's view, the way out of the dilemma of instrumentality into which earlier critical theory led us is through a philosophy of language which, through a reconstructed understanding of speech-act theory, can make a distinction between strategic and communicative action. Communicative action can be understood to be non-instrumen-tal in this sense: 'A communicatively achieved agreement has a rational basis; it cannot be imposed by either party, whether instrumentally through intervention in the situation directly or strategically through influencing decisions of the opponents' ([8.85], p. 287). It is important to note that the question of validity, which I argued a moment ago was the place where the emancipatory interest would be sustained, emerges. A communicative action has within it a claim to validity which is in principle criticizable, meaning that the person to whom such a claim is addressed can respond with either a yes or a no based, in turn, on reasons. Beyond that, if Habermas is to sustain his claim to overcoming the dilemma of instrumental reason he must agree that communicative actions are foundational. They cannot be reducible to instrumental or strategic actions. If communicative actions were reducible to instrumental or strategic actions, one would be back in the philosophy of consciousness where it was claimed by Habermas, and a certain form of earlier critical theory as well, that all action was reducible to strategic or instrumental action.[10]

It is Habermas's conviction that one can preserve the emancipatory thrust of modernity by appropriating the discursive structure of language at the level of communication. Hence, the failure of *Dialectic of Enlightenment* was to misread modernity in an oversimplified way influenced by those who had given up on it. Here is represented a debate between a position anchored in a philosophy of history which can no longer sustain an emancipatory hypothesis on the basis of historical interpretation, and a position which finds emancipatory claims redeemable, but on a transcendental level. Ultimately, the rehabilitation of critical theory concerns the nature and definition of philosophy. If the claims of critical theory can be rehabilitated on a transcendental level as the claims of a philosophy of language, then it would appear that philosophy as such can be defined *vis-à-vis* a theory of communicative action. Habermas's claim that the originary mode of language is communicative presupposes a contrafactual communicative community which is by nature predisposed to refrain from instrumental forms of domination. Hence, the assertion of communicative over strategic forms of discursive interaction assumes a political form of association which is written into the nature of language as such as the guarantor of a form of progressive emancipation. In other words, if one can claim that the

original form of discourse is emancipatory, then the dilemma posed by instrumental reason has been overcome and one is secure from the seductive temptation of the dialectic of enlightenment.

NOTES

1 There are three excellent works on the origin and development of critical theory. The most comprehensive is the monumental work by R.Wiggershaus [8.140]. M.Jay's historical work [8.131] introduced a whole generation of Americans to critical theory. Helmut Dubiel [8.128] presents the development of critical theory against the backdrop of German and international politics.

CHAPTER 9
Hermeneutics

Gadamer and Ricoeur

G.B.Madison

THE HISTORICAL BACKGROUND: ROMANTIC HERMENEUTICS

Although the term 'hermeneutics' *(hermeneutica)* is, in its current usage, of early modern origin,[1] the practice it refers to is as old as western civilization itself. Under the traditional appellation of *ars interpretandi,* hermeneutics designates the art of textual interpretation, as instanced in biblical exegesis and classical philology. In modern times, hermeneutics progressively redefined itself as a general, overall discipline dealing with the principles regulating all forms of interpretation. It was put forward as a discipline that is called into play whenever we encounter texts (or text-analogues) whose meaning is not readily apparent and which accordingly require an active effort on the part of the interpreter in order to be made intelligible. In addition to this exegetical function, hermeneutics also viewed its task as that of drawing out the practical consequences of the interpreted meaning ('application'). This dual role of understanding (or explanation) *(subtilitas intelligendi, subtilitas explicandi)* and application *(subtilitas applicandi)* is perhaps especially evident in the case of juridical hermeneutics where the task is not only to ascertain the 'meaning' or 'intent' of the law but also to discern how best to *apply* it in the circumstances at hand.

In the early nineteenth century, at the hands of Friedrich Schleiermacher (1768–1834), the scope of hermeneutics was expanded considerably. Indeed, Schleiermacher claimed for hermeneutics the status of an overall theory *(allgemeine Hermeneutik)* specifying the procedures and rules for the understanding not only of textual meaning but of cultural meaning in general *(Kunstlehre)*. Rooted in the romantic tradition, Schleiermacher, often referred to as the 'father of hermeneutics', empha-sized the 'psychological' or 'divinatory' function of hermeneutics—the purpose of interpretation being that of 'divining' the intentions of an author, or, in other words, reconstructing psychologically an author's mental life ('to understand the discourse just as well as and even better than its creator').[2] The purpose of hermeneutics is thus that of unearthing the original meaning of a text, this being equated by Schleiermacher with the meaning originally intended by the author.[3] This view of hermeneutics as a form of cultural understanding (understanding another culture or historical epoch, for instance) and the concomitant, 'psychological' view of understanding (as a grasping of the subjective intentions of authors or actors) was developed more fully towards the end of the century by Wilhelm Dilthey (1833–1911).

One of the most salient features of the nineteenth century was the rapid expansion of

the human sciences *(Geisteswissenschaften),* historiography in particular. The task that Dilthey set himself was that of furnishing a methodological foundation for these new sciences, similar to the way in which, a century earlier, Kant had sought to 'ground' the natural sciences philosophically. Conceding, like Kant, an exclusivity in the explanation of natural being to the natural sciences *(Naturwissenschaften),* Dilthey sought to go beyond Kant by arguing (as the historian J.G.Droysen had before him) that the human sciences have their own specific subject matter and, accordingly, their own, equally specific, method. A spokesperson for the *Lebensphilosophie* current at the time, Dilthey maintained that the proper object of the human sciences is something specifically *human,* namely the inner, psychic life (*Erlebnis,* lived experience) of historical and social agents. Whereas the natural sciences seek to explain phenomena in a causal and, so to speak, external fashion *(Erklären),* the method proper to the human sciences is that of emphathetic understanding *(Verstehen)*. The task of the human scientist is, or should be, that of transporting himself or herself into an alien or distant life experience, as this experience manifests or 'objectifies' itself in documents, texts ('written monuments') and other traces or expressions *(Ausdrucken)* of inner life experiences and world-views *(Weltanschauungen)*. The *Lebensphilosophie* assumption operative here is that, because the human scientist is a living being, a part of life, he or she is, as a matter of principle, capable of reconstructively understanding other objectifications of life. Understanding (the method proper to the human sciences) is thus a matter of *interpretation,* and interpretation *(Deutung)* is the means whereby, through its outward, objective 'expressions', we can come to know in its own innerness what is humanly other, can, in effect, imaginatively coincide with it; *relive* it. Dilthey thus viewed the goal or purpose of interpretation as that of achieving a *reproduction (Nachbildung)* of alien life experiences.

Dilthey's purpose in conceptualizing the hermeneutical enterprise in this way was, as I indicated, to secure for the human sciences their own methodological autonomy and their own scientific objectivity *vis-à-vis* the natural sciences. The human sciences can lay claim to their own rightful epistemological status, can, indeed, lay claim to *validity,* if, as was Dilthey's aim, it can be shown that there is a 'method' which is specific to them, and which is different from the one characteristic of the natural sciences. This, Dilthey argued, was the method of *Verstehen,* as opposed to that of *Erklärung;* the task of the human sciences is not to 'explain' human phenomena, but to 'understand' them.

As a matter of historical interest, it may be noted that Dilthey's 'solution' to what could be called the 'problem of the human (or social) sciences' was revived several decades later in the mid twentieth century by Peter Winch, at roughly the same time that Gadamer and Ricoeur were developing their own quite different version of hermeneutics. In opposition to the then dominant positivist approach to the human sciences, which (as in the case of Carl Hempel and his 'covering law' model)[4] maintained that these disciplines could be made 'scientific' if they could manage, somehow, to incorporate the explanatory methods of the natural sciences, Winch argued that the 'explanatory' approach is totally inappropriate in the human sciences. With Wittgenstein's notion of 'forms of life' in mind, Winch maintained that 'the concepts used by primitive peoples can only be interpreted in the context of the way of life of those peoples'. The task of the anthropologist, for instance, can be no more than that of empathetically projecting himself or herself into an alien 'form of life'. When one has empathetically described in

this way a particular 'language game', there is nothing more to be done. Like Dilthey, Winch drew a radical distinction between empathetic understanding and causal explanation and suggested that the human sciences should limit themselves to the former, arguing that human or social relations are an 'unsuitable subject for generalizations and theories of the scientific son to be formulated about them'. 'The concepts used by primitive peoples', he insisted, 'can only be interpreted in the context of the way of life of those peoples.'[5] Winch's position is accurately characterized by Richard J.Bernstein in the following terms:

> Winch's arguments about the logical gap between the social and the natural can be understood as a linguistic version of the dichotomy between the *Naturwissenschaften* and the *Geisteswissenschaften*. Even the arguments that he uses to justify his claims sometimes read like a translation, in the new linguistic idiom, of those advanced by Dilthey.[6]

The important thing to note in this regard is how this Diltheyan-style attempt to make of life a special and irreducible category and to set it up as the foundational justification for a special and irreducible son of science is, by that very fact, to oppose it to another distinct category, that of nature, which generates another, opposed kind of science. Explanation and understanding are viewed as two different, and even antagonistic, modes of inquiry. As we shall see later in this chapter, one of the prime objectives of Ricoeur's hermeneutics has been to overcome the understanding/explanation dichotomy inherited from Dilthey which has bedevilled so much of the debate in the twentieth century as to the epistemological status of the human sciences. Indeed, it could be said that one of the principal tasks of contemporary phenomenological hermeneutics[7] continues to consist, on the one hand, in 'depsychologizing' or 'desubjectivizing' the notion of meaning (rejecting thereby an empathetic notion of understanding) and, on the other hand, and correlatively, in attempting to specify the particular sense in which (or the degree to which) it can properly be said that the human sciences are indeed 'explanatory'.

In order to position ourselves for understanding what is distinctive about the hermeneutics of Gadamer and Ricoeur, it should also be noted that the Schleiermacher-Dilthey tradition in hermeneutics (customarily referred to as 'romantic hermeneutics') has been carried on in this century in the work of Emilio Betti and E.D.Hirsch, Jr, both of whom have strenuously objected to the version of hermeneutics put forward by Gadamer and Ricoeur. In an attempt to revive traditional hermeneutics (which they view phenomenological hermeneutics as having unfortunately displaced), Betti and Hirsch have sought to argue anew for hermeneutics as a general body of methodological principles and rules for achieving validity in interpretation.

Betti, the founder in 1955 of an institute for hermeneutics in Rome, has sought to resuscitate Dilthey's concern for achieving objective validity in our interpretations of the various 'objectifications' of human experience. He has attacked Gadamer for, as he sees it, undermining the scientific concern for objectivity and, because of the emphasis that Gadamer places on the notion of 'application' (to be discussed below), of opening the door to arbitrariness (or 'subjectivism') in interpretation and, indeed, to relativism. At the outset of his major work of 1962, *Die Hermeneutik als allgemeine Methodik der*

Geiteswissenschaften,[8] Betti indirectly accused Gadamer of abandoning the 'venerable older form of hermeneutics' by having turned his back on its overriding concern for correctness or objectivity in interpretation.

Betti's critique was taken up by Hirsch with the publication in 1967 of the latter's *Validity in Interpretation,*[9] the first original and systematic treatise on hermeneutics written in English. As the title of his book so clearly indicates, Hirsch, like Betti and the other romantic hermeneuticists before him, was concerned to make of hermeneutics a*science* capable of furnishing 'correct' interpretations of 'verbal meanings' presumed to exist independently of the interpretive process itself. Hirsch's critical arguments are much the same as those of Betti, but he does add a new, methodological twist to his overall position. Hirsch's strategy for transforming interpretation into a genuine science is, quite simply, to transfer—lock, stock and barrel—the method of hypothetico-deductionism and Popperian falsificationism from the philosophy of the natural sciences to the humanities and, in particular, to the interpretation of literary texts. Like Popper's 'logic of scientific discovery', Hirsch's 'logic of validation' maintains that there can be no *method* for 'guessing' ('understanding') an author's meaning but that once such 'conjectures' or 'hypotheses' happen to be arrived at, they can subsequently be subjected to rigorous testing in such a way as to draw 'probability judgments' supported by 'evidence'. 'The act of understanding', Hirsch writes, 'is at first a genial (or a mistaken) guess, and there are no methods for making guesses, or rules for generating insights. The methodological activity of interpretation commences when we begin to test and criticize our guesses' (*Validity,* p. 207). And the activity of testing 'interpretive hypotheses', he says, 'is not in principle different from devising experiments that can sponsor decisions between hypotheses in the natural sciences' (p. 206).

The curious result of Hirsch's attempt to make of hermeneutics a science is to have narrowed considerably the scope that, traditionally, was claimed for it by the romantics. Hermeneutics is no longer concerned with understanding, interpretation and application but with interpretation alone, and this conceived of merely as 'validation'. In Hirsch's hands hermeneutics becomes essentially no more than an interpretive technique *(technē hermeneutikē)* for arbitrating between possible meanings, conflicting interpretations, with the aim of deciding which of them is the *one and only* true meaning of the text, i.e., the one intended by the author. Moreover, in conceiving of 'validation' in a Popperian and positivistic fashion, Hirsch effectively collapses the distinction between the natural and the human sciences,[10] sacrificing in the process the concern of Dilthey and others to safeguard the integrity and autonomy of the latter. Hirsch resolves the long-standing explanation/understanding debate—but at the total expense of 'understanding'. He uncritically endorses the scientistic claim that the natural sciences represent a model for all legitimate knowledge and are canonical for all other forms of knowledge.

In the wake of Betti and Hirsch, critics of Gadamer and Ricoeur continue to iterate the (by now well-worn) objection that their version of hermeneutics is incapable of generating a method by means of which 'correct' interpretations of textual meaning can be conclusively arrived at and that, because of this, it inevitably results in subjectivism and relativism.[11] We can begin to understand what is specific to phenomenological hermeneutics when we can understand its own reasons for rejecting the modernist obsession with 'method' and when, moreover, we can see why phenomenological

hermeneutics should in its turn accuse traditional hermeneutics of falling prey to a naive form of *objectivism*.

MOVING BEYOND THE TRADITION: PHENOMENOLOGICAL HERMENEUTICS

It would seem to be something of a general rule that any specifically human phenomenon is understood best when understood in terms of that from which it differs. It is certainly the case in any event that what goes to make up the specificity of the hermeneutics defended by Hans-Georg Gadamer (1900-) and Paul Ricoeur (1915-) is the way in which it differs from, and stands opposed to, traditional hermeneutics, as portrayed in the preceding remarks. For his part Ricoeur has explicitly characterized his hermeneutics in terms of its oppositional role when he declared: 'I am fighting on two fronts.' The two fronts he is referring to are, on the one hand, the 'romantic illusion' of empathetic understanding and, on the other hand, the 'positivist illusion' of a textual objectivity closed in upon itself and wholly independent of the subjectivity of both author and reader' (OI, 194–5).[12] In the latter case Ricoeur had the structuralist approach to texts in mind, but his remark would apply equally well to Hirsch's brand of hermeneutics to the degree that the latter seeks to maintain the pristine objectivity of a text closed in upon itself and wholly independent of the subjectivity of the reader (of its 'application'). Gadamer has sought in a similar way to clarify his position by differentiating it from that of Betti.

In the Foreword to the second edition (1965) of his *magnum opus, Truth and Method,* Gadamer attempted to defend himself against Betti's criticisms. His response was basically two-sided. On the one hand, he sought to justify his lack of concern for 'method' and, on the other, to defend himself against the charge of 'subjectivism'. In regard to the question of method he stated:

> My revival of the expression 'hermeneutics', with its long tradition, has apparently led to some misunderstandings.[13] I did not intend to produce an art or technique of understanding, in the manner of the earlier hermeneutics. I did not wish to elaborate a system of rules to describe, let alone direct, the methodical procedure of the human sciences…. My real concern was and isphilosophic: not what we do or what we ought to do, but what happens to us over and above our wanting and doing.[14]
>
> In other words, the goal that Gadamer set himself was that of envisaging hermeneutics in a way thoroughly different from the way in which it traditionally had been envisaged. In stark contrast to the positivistinspired view of hermeneutics that Hirsch was subsequently to defend, Gadamer's goal was not *prescriptive* (laying down 'rules' for (correct) interpretation) but, in the phenomenological sense of the term, *descriptive* (seeking to ascertain what actually occurs whenever we seek to understand something). The difference between Gadamer's hermeneutics and traditional hermeneutics could be aptly compared to the difference between traditional philosophy of science, of either a

positivist or Popperian sort, and the radically new approach to the philosophy of science instituted by Thomas Kuhn in *The Structure of Scientific Revolutions* (first published in 1962, two years after the original German edition of Gadamer's *Truth and Method*), a work which was to revolutionize the philosophy of science. Analogously to Gadamer, Kuhn sought not (like, for instance, Popper) to lay down methodological criteria that scientists must meet if what they do is to merit the appellation 'science', but sought instead simply to describe that particular activity which we refer to when we speak of someone 'doing science' (the actual characteristics of which are more often than not significantly different from what scientists are liable to say they are doing when pressed to make philosophical statements about their actual practice). With Gadamer explicitly in mind, Kuhn was later to describe his own work as 'hermeneutical'.

As the text cited above clearly indicates, Gadamer's purpose was not 'methodological' but, as he says, 'philosophic'. That is, Gadamer's goal was to elaborate a general *philosophy* of human understanding, in all of its various modes. It is precisely for this reason that his thought is often referred to as 'philosophical hermeneutics'.[15] A couple of pages further on in the Foreword Gadamer, again with reference to Betti, states his 'philosophic concern' in the following way:

> The purpose of my investigation is not to offer a general theory of interpretation and a differential account of its methods (which E.Betti has done so well) but to discover what is common to all modes of understanding and to show that understanding is never subjective behaviour toward a given 'object', but towards its effective history—the history of its influence; in other words, understanding belongs to the being of that which is understood.
>
> ([9.7], xix)

What in the present context is to be noted is how, in this last remark, Gadamer is attempting to respond to Betti's accusation of 'subjectivism'. Understanding, Gadamer is effectively saying, is not so much a 'subjective' as it is an *ontological* process. Understanding is not something that the human subject or we 'do' as it is something that, by reason of our 'belonging' to history *(Zugehörigkeit), happens* to us. Understanding is not a subjective accomplishment but an 'event' *(Geshehen),* i.e., 'something of which a prior condition is its being situated within a process of tradition' ([9.7], 276).

If, as we shall see, phenomenological hermeneutics is adamantly opposed to all forms of objectivism, it is equally opposed to all forms of modern subjectivism. As Ricoeur would say, it is continually constrained to do battle on two fronts. The central thrust of phenomenological hermeneutics is to move beyond *both* objectivism *and* subjectivism, which is to say, also, beyond relativism. One of the core features of Ricoeur's hermeneutics has been his ongoing attempt to articulate a notion of 'the subject' which would be free from all forms of modern subjectivism.[16] Unlike other forms of postmodern thought, hermeneutics has strenuously resisted the current, and very fashionable, anti-humanist calls for the abolition of 'the subject' (the 'end of "man"'). The notion of the

subject, hermeneutics insists, is not to be abandoned—but it must indeed be stripped of all its modernist, metaphysical accretions. This continued allegiance on the part of hermeneutics to the notion of the subject testifies to its rootedness in the phenomenological tradition inaugurated by Edmund Husserl.

THE PHILOSOPHICAL BACKGROUND OF PHENOMENOLOGICAL HERMENEUTICS: HUSSERL AND HEIDEGGER

All of Husserl's philosophizing, from roughly 1900 onwards, was a sustained attempt to overcome the debilitating legacy of modern philosophy and, in particular, the subject/object dichotomy instituted by Descartes.[17] A pivotal moment in the unfolding of Husserl's phenomenology occurred in 1907 with a series of five lectures delivered in Göttingen (published subsequently in 1950 by Walter Biemel under the title *Die Idee der Phänomenologie*). In these lectures Husserl introduced his celebrated 'phenomenological reduction', the express purpose of which was to achieve a decisive overcoming of what the French translator of this work, Alexandre Lowit, has called 'la situation phénoménale du clivage', in other words, the subject/object split which presides over the origin and subsequent unfolding of modern philosophy from Descartes onwards. To speak in contemporary terms, what Husserl was seeking to accomplish by means of the 'reduction' was a thoroughgoing 'decon-struction' of the central problematic of modern philosophy itself, namely, the 'epistemological' problem of how an isolated subjectivity, closed in upon itself, can none the less manage to 'transcend' itself in such a way as to achieve a 'knowledge' of the 'external world'.[18] This, it may be noted, is, in one of its many variants, the problem which continues to inform the work of Betti and Hirsch (how to 'validate objectively' our own 'subjective ideas').

Thanks to the 'reduction' however, Husserl effectively displaced or deconstructed the epistemological problematic itself. He did so by discrediting (revealing the 'philosophical absurdity' of) its two constitutive notions: the notion of an 'objective', 'in-itself' world and the correlative notion that 'knowledge' consists in forming inner 'representations' on the part of an isolated 'cognizing subject' of this supposedly objective or 'external' world. The subsequent history of the phenomenological movement in the twentieth century—from Heidegger and Merleau-Ponty to Gadamer and Ricoeur—could be viewed as nothing other than an attempt 'to extract the most extreme possibilities'[19] from Husserl's own deconstruction of the epistemological problematic. Building on Husserl's own point of departure, phenomenological hermeneutics has systematically defined itself in terms of its opposition to both objectivism and subjectivism.

If the key methodological notion in Husserl's phenomenology is that of the reduction, the key substantive notion is the one that Husserl uncovered late in his life, that of the life-world *(Lebenswelt)*. This too was to play a decisive role in the evolution of hermeneutics.[20] As was later pointed out by Merleau-Ponty (who in his own revision of Husserlian phenomenology anticipated a great many of the themes developed later on in greater detail by hermeneutics), what Husserl's phenomenological reduction serves ultimately to reveal is the life-world itself and this, Merleau-Ponty observed, is exactly what Heidegger referred to as 'being-in-the-world'.[21] The basic paradigm of modern

epistemologism, dominated as it is by the subject/object dichotomy, is that of an isolated subjectivity (the 'mind') which is supposed to be related to the 'external' or 'objective' world by means of ideas or sense impressions (subsisting *within* the 'mind' itself) which are said to be 'true' (a 'true likeness') to the degree that they adequately 'represent' or 'refer to' facts or states of affairs in 'reality'. This modernist view of things (which could appropriately be labelled 'referentialist-representationalism') is one that continues to prevail with theorists such as Betti and Hirsch. It was in opposition to modern epistemologism, however, that Martin Heidegger argued in *Being and Time* (1927) that a relation (a *commercium*) between the subject and the world does not first get established on the level of 'cognition' or 'knowledge'.[22] Before any explicit awareness on its part, the human subject *(Dasein)* finds itself already in a world, 'thrown' into it, as it were. This surrounding world, the life-world, is thus one which is 'always already' there. What this pregivenness (as Husserl would say) of the life-world means is that, by virtue of our very existence, i.e. our 'being-in-the-world', we possess what Heidegger called a 'pre-ontological understanding' of the world (of 'being'). All explicit understandings or theorizings do no more than build on this always presupposed—and thus never fully thematizable—'ground'. For Heidegger, therefore, understanding is not so much a mode of 'knowing' as it is one of 'being'. As Gadamer would subsequently put it, consciousness is more *Sein* than *Bewusstsein*.

Heidegger refers to this situation as 'facticity': if there is an always presupposed element in all our explicit understandings, this means that, in our various interpretations of things, we can never hope to achieve total transparency. The lesson that phenomenological hermeneutics was to draw from this Heideggerian position is that human understanding is essentially 'finite'. As Ricoeur has said: 'The gesture of hermeneutics is a humble one of acknowledging the historical conditions to which all human understanding is subsumed in the reign of finitude.'[23] What this means is that there can be no 'science', in the traditional philosophical sense of the term *(episteme, scientia intuitiva),* of existence (or of 'being'). The hermeneutics of Gadamer and Ricoeur could most fittingly be characterized as nothing other than a systematic attempt to draw all the philosophical conclusions that follow from a recognition of the inescapable finitude of human understanding (this is why they will argue, against objectivists such as Betti and Hirsch, that it is impossible ever to arrive at *the* (one and only) correct interpretation of a text or any other human product). Their hermeneutics will be 'a hermeneutics of finitude' ([9.15], 96).

Heidegger's 'existential analytic'—his phenomenological-interpretive description of human existence and its basic structures (what he referred to as *Existentialen*), his attempt to elaborate a 'hermeneutics of facticity', of everyday life, the life-world—provided the crucial impetus for subsequent hermeneutics. What is peculiar to Heidegger's hermeneutics is that it is an *ontological* hermeneutics. It is ontological (rather than 'methodological') in that, unlike what traditionally had gone under the heading 'hermeneutics', it was not concerned to specify criteria for 'correct' interpretations but instead had for its object something much more fundamental (Heidegger referred to his project as 'fundamental ontology'), namely a properly philosophical elucidation or interpretation of the basic (ontological) structures of human understanding which is to say, human existence) itself. The move that Heidegger made in this connection was to

prove decisive for the subsequent development of hermeneutics. Understanding, Heidegger insisted, is not merely one attribute of our being, something that we may 'have' or not (in the sense in which we are said to 'have knowledge'); understanding is rather that which, as existing beings, we most fundamentally *are*.

As existing beings, we exist only in the mode of becoming (as Kierkegaard—from whom Heidegger drew much of his inspiration—would have said), and thus *what* we most fundamentally are is not anything fixed and given but rather what we can *become, i.e., possibility*. This in turn means that the understanding which we are is itself nothing other than an understanding of the possible ways in which we could be ('Understanding is the Being of such potentiality-for Being', *BT,* 183). As existing, understanding beings, we are continually 'projecting' possible ways of being (our being is defined in terms of these 'projects'). What Heidegger calls 'interpretation' *(Auslegung)* is itself nothing other than a possibility belonging to understanding. That is, when our prethematic, pre-predicative or tacit understanding is developed, it becomes interpretation.[24] Interpretation (explication, laying-out, *Auslegen*) is the working-out *(Ausarbeitung)* of the possible modes of being that have been projected by the understanding. The point that Heidegger is insisting on is that interpretation is always derivative; interpretation discloses only what has *already* been understood (albeit only tacitly).

In other words, interpretation is never without presuppositions (Heidegger referred to these as 'fore-structures'). It is never the mere mirroring of an 'objectivity' which simply stands there naked before us (the 'bare facts'); in interpretation there is always something that is 'taken for granted'. With the example of textual interpretation in mind, Heidegger pointedly remarks that if in one's interpretations one appeals to 'what "stands there", then one finds that what "stands there" in the first instance is nothing other than the obvious undiscussed assumption *[Vormeinung]* of the person who does the interpreting' (*BT,* 192). There is, then, an essential *circularity* between understanding and interpretation.

In this way Heidegger effectively ontologizes what traditional hermeneutics had called the 'hermeneutical circle', which, as a methodological rule, simply meant that when interpreting a text one ought continually to interpret the parts in terms of the whole, and the whole in terms of the parts. For Heidegger, however, the 'circle' of understanding goes much deeper; it is in fact rooted in the existential constitution of human being itself. Human understanding itself has a circular structure. This amounts to saying that all interpretive understandings are presuppositional or 'anticipatory' by nature (interpretation must…already operate in that which is understood' (*BT,* 194).

Since the 'circle' is constitutive of our very being—since, in other words, it constitutes the very condition of possibility of our understanding anything at all—it would be altogether misleading to view it, as a logician might, as a 'vicious circle'. Even to view the circularity involved in all understanding—its 'presuppositional' nature—as an inevitable or unfortunate imperfection of human understanding that, in an ideal situation, could or ought to be overcome would mean, Heidegger says, that one has misunderstood the act of understanding 'from the ground up' (*BT,* 194). Indeed, all attempts to deny the 'circle' or to escape from it testify to a false consciousness. What Heidegger is here calling into question is the Cartesian ideal that has dominated all of modern philosophy, namely, the notion that truly 'objective' knowledge must be presuppositionless or 'foundational', grounded upon some rock-solid, 'objective' foundation (even the logical

positivists continued to demand such a foundation and believed that they had found it in a combination of the laws of logic and raw 'sense data'). Thus, he maintains that the objectivistic ideal of 'a historiology which would be as independent of the standpoint of the observer as our knowledge of Nature is supposed to be' is a false ideal, an idol, in fact, of the understanding. Both scientistic objectivism and common sense (the 'natural attitude', as Husserl would have said) misunderstand understanding (see *BT,* 363). The important thing, Heidegger says, the lesson to be drawn from the phenomenological analysis of human being-in-the-world, is that we ought not even to try to get out of the circle but should attempt rather 'to come into it in the right way' (*BT,* 195). We must, in other words, learn in our theorizing to do without 'foundations' (such as, in textual interpretation, the supposedly original intention of the author). It would not be too much of an exaggeration to say that the whole meaning and significance of post-Heideggerian hermeneutics consists in its strenuous attempt to take this lesson to heart and, accordingly, to elaborate a theory of understanding and interpretation that could most properly be termed 'non-foundational'.

PHENOMENOLOGICAL HERMENEUTICS: THE BASIC THEMES

The putative purpose of Heidegger's lengthy analysis in *Being and Time* of the basic structures of human being was to set the stage for raising anew the age-old question of the meaning of Being, a question which Heidegger believed had increasingly been lost sight of since the time of the ancient Greeks. In subsequent writings Heidegger attempted to find a more direct approach to the Being-question *(die Seinsfrage),* abandoning in the process the existential orientation of his earlier work which, he believed, had distracted him from this overriding issue. The key actor in Heidegger's later writings is no longer the human being *(Dasein)* but Being itself, Being-as-such. Neither Gadamer nor Ricoeur chose to follow Heidegger in this all-out pursuit of 'Being'. The following remark of Gadamer reflects well the agenda that hermeneutics has set itself—and which is not that of Heidegger's ontological eschatology: 'What man needs is not only a persistent asking of ultimate questions, but the sense of what is feasible, what is possible, what is correct, here and now' ([9.7], xxv).

Throughout his career Ricoeur has, for his part, held fast to a fundamentally existential motivation, conceiving of hermeneutics as an attempt on the part of the reflecting subject to come to grips with 'the desire to be and the effort to exist which constitute us'[25] (his 'existentialism' is at the root of his opposition to scientistic objectivism), and over the last several decades Gadamer has greatly expanded the scope of Heidegger's earlier, existential hermeneutics (the 'hermeneutics of facticity'), elaborating in the process an all-inclusive philosophical discipline. As he once remarked: 'I bypass Heidegger's philosophic intent, the revival of the "problem of Being".'[26] Unlike Heidegger, Gadamer has focused his interest not on the question of 'Being' but on the *Geisteswissenschaften,* on the nature and scope of the human sciences. 'We make', he said, 'a decided relation between the human sciences and philosophy…. The human sciences are not only a problem *for* philosophy, on the contrary, they represent a problem *of* philosophy' (*PHC,* 112). As the subject matter of his writings testifies, Ricoeur has also devoted a great deal

of his philosophical attention to human science issues. If there is a difference between the two hermeneuticists in this regard, it is that Ricoeur feels that Gadamer has slighted important methodological issues having to do with the human sciences in his concern to accord them a special ontological status *vis-à-vis* the natural sciences ('an entirely different notion of knowledge and truth' [*PHC,* 113]). We shall, accordingly, return to the relation between hermeneutics and the human sciences after having explored some of the basic tenets of hermeneutics *qua* philosophy.

In responding to Betti's charge that his shift away from the concern of traditional hermeneutics for verificatory method encourages subjectivism and arbitrariness in interpretation, Gadamer, it will be recalled, asserted: 'understanding is never subjective behaviour toward a given "object", but towards its effective history—the history of its influence.' One of the most outstanding features of Gadamer's hermeneutics is the emphasis he places on the 'historicality' or tradition-laden nature of human understanding. 'It is not really ourselves who understand', he in fact says, 'it is always a past that allows us to say, "I have understood"' ([9.5] 58). Gadamer defends himself against the charge of subjectivism by maintaining that interpretation is never—indeed, can never be—the act of an isolated, monadic subject, for the subject's own self-understanding is inevitably a function of the historical tradition to which he or she belongs. In fact, Gadamer attempts to turn the tables on the objectivists by arguing that the 'presuppositionless' or 'objective' view of understanding that their theory of interpretation calls for is an existential impossibility, that, as Heidegger would say, it involves a thoroughgoing misunderstanding of human understanding.

It is in this context that Gadamer's famous 'rehabilitation' of *prejudice* must be understood. When Gadamer provocatively asserts that prejudices are integral to all understanding, he is not condoning wilful bias or bigotry. He is simply generalizing on Heidegger's observations on the 'anticipatory' nature of understanding, the fact that all understanding operates within the context of certain pre-given 'fore-structures'. 'Prejudice' must be understood in the literal sense of a 'pre-judgment' (or a pre-reflective judgment), a presupposition, not in the pejorative sense of the term which has prevailed since the Enlightenment. The polemical thrust of Gadamer's speaking of 'prejudice' is in fact directed against what he calls the Enlightenment 'prejudice against prejudice' ([9.7], 240). There can be, he wants to argue, 'legitimate prejudices'. Here is yet another, and most basic, instance of how phenomenological hermeneutics essentially defines itself in opposition to modernist objectivism. The aim of Gadamer's rehabilitation of prejudice is to call into question the very notions of reason and knowledge that we have inherited from Cartesianism and the rationalism of the Enlightenment.

In this rationalist view of things *reason* stands opposed to *authority;* the 'prejudice against prejudice' is indeed, on a deeper level, a prejudice against 'authority' itself and as such. The peculiarly rationalist prejudice is that true knowledge can be had only by freeing ourselves from all inherited beliefs and opinions (the 'authority of the tradition') so as to create a *tabula rasa* on which genuinely 'objective' knowledge can be erected. What Gadamer objects to here is the quite arbitrary way in which Enlightenment rationalism equates authority with blind obedience and domination; as there can be 'legitimate prejudices', so likewise the recognition of authority can itself be fully rational. Gadamer asserts:

> It is true that it is primarily persons that have authority; but the authority of persons is based ultimately, not on the subjection and abdication of reason, but on recognition and knowledge—knowledge, namely, that the other is superior to oneself in judgment and insight and that for this reason his judgment takes precedence, i.e., it has priority over one's own. This is connected with the fact that authority cannot actually be bestowed, but is acquired and must be acquired, if someone is to lay claim to it. It rests on recognition and hence on an act of reason itself which, aware of its own limitations, accepts that others have better understanding. Authority in this sense, properly understood, has nothing to do with blind obedience to a command. Indeed, authority has nothing to do with obedience, but rather with knowledge.
>
> ([9.7],

As Gadamer goes on to say, if we accord recognition to anything, it is because 'what authority states is not irrational and arbitrary, but can be accepted in principle' ([9.7], 249). There is, therefore, something like rightful authority, the recognition whereof is itself fully rational.

Gadamer contends that the Enlightenment ideal of Reason, as a 'faculty' enabling the individual to make contact with 'reality' unmediated by authority and tradition, is in fact an idol of modernity. He is especially opposed to the modernist assumption that reason so conceived (in an objectivistic-instrumentalist fashion) should serve as the basis for the complete reorganization ('rationalization') of society. As Richard Bernstein points out: 'We can read his philosophic hermeneutic as a meditation on the meaning of human finitude, as a constant warning against the excesses of what he calls "planning reason", a caution that philosophy must give up the idea of an "infinite intellect".'[27]

Curiously enough (though not surprisingly), the modernist quest for 'objective knowledge' is itself supremely subjectivistic. It presupposes that the thinking subject has direct access only to the contents of its own 'mind' (which is assumed to be fully transparent to itself) but that, with suitable methodological procedures, this isolated individual can, by means of Reason, achieve genuine knowledge on his or her own. An appropriate label for this view would be 'methodological solipsism'. For Gadamer, however, 'Understanding is not to be thought of so much as an action of one's subjectivity, but as the placing of oneself within a process of tradition, in which past and present are constantly fused' ([9.7], 258).

It can thus be seen that Gadamer's defence of 'prejudice' goes hand in hand with the emphasis he places on *tradition;* indeed, for Gadamer the ultimate locus of authority is tradition itself. It is interesting to note in this regard that post-positivist philosophy of science has, in the case of Thomas Kuhn, Paul Feyerabend and others, sought to highlight the role that tradition plays in that rational enterprise called 'science'. Scientists, it is now recognized, do not simply 'observe and describe' bare facts; what they look for, and what they accordingly find, is a function not of an abstract method ('the experimental method') but of the 'paradigms' or research traditions in which they happen to be working (and into which they have been enculturated in their training as scientists). This parallel between the new philosophy of science and Gadamerian hermeneutics is perhaps

especially interesting and noteworthy in that in his work Gadamer has focused exclusively on the human sciences and has not sought to indicate what a hermeneutical approach to the natural sciences might look like. But the point that the new philosophers of science are making is a properly Gadamerian one: there are no answers 'in themselves'; the only answers that scientists get is to the questions they have asked, and these are ones which they owe to the tradition within which they are working.

In his reflections on the human sciences Gadamer has devoted particular attention to the importance of the *question*. The logic of the human sciences, he says, is 'a logic of the question' ([9.7], 333, see also 325ff.). All knowledge comes only in the form of an answer to a question. And much as Feyerabend was later to do in his *Against Method,* Gadamer insists that 'There is no such thing as a method of learning to ask questions, of learning to see what needs to be questioned' ([9.7], 329). This of course does not mean, as a neopositivist like Hirsch would maintain, that there is no 'art of questioning'. There is indeed such an art, and this is precisely one we learn from the tradition to which, as thinking beings, we belong.

From what has been said, it can be readily appreciated why, in his attempt to elaborate an overall philosophy of human understanding, Gadamer should devote so much of his attention to the notion of tradition. If there is no understanding without presuppositions or 'prejudices', then it is incumbent on a philosophical hermeneutics to thematize the role that tradition plays in our understanding, since our enabling presuppositions are historical by nature, something handed down to us by the tradition(s) to which we belong—a prime instance of 'the historicality that is part of all understanding' ([9.7], 333). In highlighting tradition in this way, Gadamer is led to articulate one of the core notions in his work, that of *wirkungsgeschichtliche Bewusstsein*.

Like so many other German terms, this one defies easy translation. The 'hermeneutical consciousness' it designates is 'the consciousness of effective history' or, alternatively, 'the consciousness in which history is effectively at work'. What effective-history 'means' is that 'both what seems to us worth enquiring about and what will appear as an object of investigation' are determined in advance ([9.7], 267–8). The term connotes a consciousness which is at once affected by history and aware of itself as so affected, an awareness which precludes our regarding history as an object since it is itself already implicated in history.[28] As Ricoeur characterizes it, effective-history is 'the massive and global fact whereby consciousness, even before its awakening as such, belongs to and depends on that which affects it' ([9.15], 74). 'Effective-history' is Gadamer's response to 'historical objectivism'. Gadamer not only argues that there can be no purely 'objective' knowledge of history—since history is already effectively at work in all historiological attempts at understanding it—he argues also that the rootedness of understanding in its own history (a history which it therefore continually 'presupposes') must not be viewed as an impediment to genuine understanding, to 'truth'. Or as Ricoeur sums it up: 'The action of tradition [effective-history] and historical investigation are fused by a bond which no critical consciousness could desolve without rendering the research itself nonsensical' ([9.15], 76).

That indeed is Gadamer's main point. Effective-history does not signal a limitation on our ability to understand (unless, of course, one wishes to contrast human understanding with divine understanding, in which case human understanding will always come out the

loser) as much as it designates the positive and productive possibility of any understanding that lays claim to truth. To speak in traditional philosophical terms, effective-history is the very condition of possibility of understanding. Effective-history provides us with our 'enabling' presuppositions.

There is a phenomenological parallel between the world in which we exist as thinking beings and the world in which we exist as perceiving beings: both have *horizons*.[29] Effective-history provides us with the intelligible horizon within which, as thinking beings, we 'live, move, and have our being'. Now, what occurs in the case of historical or intercultural understanding is what Gadamer calls a 'fusion of horizons' *(Horizontsverschmelzung)*. The term 'fusion' is perhaps misleading, however. When we attain to a 'hermeneutical consciousness' of another historical or cultural horizon, we do not coincide with the other (cf. Dilthey's notion of *nachleben,* re-living), but our horizon and that of the other partially overlap, as it were. The best illustration of such a 'fusion' is that of a meaningful conversation. As Gadamer writes:

> Just as in a conversation, when we have discovered the standpoint and horizon of the other person, his ideas become intelligible, without our necessarily having to agree with him, the person who thinks historically comes to understand the meaning of what has been handed down, without necessarily agreeing with it, or seeing himself in it.[30]
>
> ([9.7], 270)

Were one inclined to draw out the applicational significance of Gadamer's notion of a fusion of horizons, it would be most instructive to interpret it in the light of recent debates about 'incommensurability'.[31] What this would serve to reveal is how the notion of a fusion of horizons, like so many other hermeneutical notions, is an intrinsically oppositional or dialectical notion. In regard, for instance, to the question as to whether different cultural world-views are in any way 'commensurable', the fusion-of-horizons notion would oblige one to defend a position which would be *neither* absolutist *nor* relativist. On the one hand, the hermeneuticist would want to argue—as Richard Rorty, for instance, has done—against the idea of 'universal commen-suration', the idea, that is, that the values operative in different cultures can be measured or ranked according to some univocal, hierarchical standard of comparison, by means of some kind of epistemological algorithm. On the other hand, however, the hermeneuticist would want to argue just as strenuously against an unrestrained 'particularism', i.e., against the outright rejection of universalism altogether (cf. Rorty's defence of 'ethnocentrism'). The hermeneutical notion of a fusion of horizons means (in practical or pragmatic terms) that a meaningful dialogue with the 'other' (a genuine contact with the other, as other) is always possible, given the necessary effort and good will—even though a Hegelian-like *Aufhebung* of differences in a univocally uniform understanding is neither possible nor even, for that matter, desirable.[32] Expressing much the same point, though in a somewhat different way, Ricoeur observes:

> This [the fusion of horizons] is a dialectical concept which results from the rejection of two alternatives: objectivism, whereby the objectification of the

> other is premissed on the forgetting of oneself; and absolute knowledge, according to which universal history can be articulated within a single horizon. We exist neither in closed horizons, nor within an horizon that is unique. No horizon is closed, since it is possible to place oneself in another point of view and in another culture…. But no horizon is unique, since the tension between the other and oneself is unsurpassable.
>
> ([9.15], 75)

To sum up: what Gadamer has called 'tradition' is nothing other than the way in which our own horizons are constantly shifting through 'fusion' with other horizons. 'In a tradition,' he says, 'this process of fusion is continually going on, for there old and new continually grow together to make something of living value, without either being explicitly distinguished from the other' ([9.7], 273). The all-inclusive name for the phenomenon in question is 'understanding'.

To highlight in this way the 'horizonal' nature of understanding is, once again, to underscore the essential finitude of all understanding. 'Philosophical thinking', Gadamer insists, 'is not science at all…. There is no claim of definitive knowledge, with the exception of one: the acknowledgement of the finitude of human being in itself.'[33] The important thing to note in this regard, however, is that while an emphasis on finitude rules out the possibility of our ever attaining to 'definitive knowledge', it does not exclude the possibility of *truth*. It does not, that is, if and when truth is no longer conceived of in a metaphysical fashion, as a state of rest in which one has achieved a final coincidence with the object in question (e.g., the meaning of a text), but is reconceptualized to mean a mode of existence in which we keep ourselves open to new experiences, to further expansions in our horizons. Truth, for Gadamer, is not a static but a dynamic concept. It is not an epistemological but an existential concept, designating a *possible mode of being-in-the-world*. When, in the very last line of *Truth and Method,* Gadamer speaks of 'a discipline of questioning and research, a discipline that guarantees truth', what he means by 'truth' tends to coincide with the notion of *openness*. This is why he writes: 'The truth of experience always contains an orientation towards new experience…. The dialectic of experience has its own fulfilment not in definitive knowledge, but in that openness to experience that is encouraged by experience itself' ([9.7], 319).[34]

If human understanding is effectively historical, this means that it is also *linguistic* through and through, since it is through language that the tradition is effectively mediated and 'fused' with the present (which means also that in the language we speak and by means of which we achieve understanding the past continues to be effectively present). 'The linguistic quality of understanding', Gadamer remarks, 'is the concretion of effective-historical understanding'; 'it is the nature of tradition to exist in the medium of language' ([9.7], 351). Ricoeur has summed up the chief consequence of the 'new ontology of understanding' in the following way: 'there is no self-understanding which is not *mediated* by signs, symbols and texts…that is to say that it is *language* that is the primary condition of all human experience' (OI, 191). For both Gadamer and Ricoeur the ultimate goal of all understanding is self-understanding, and, to the degree that this occurs, it occurs by means of language. As was mentioned earlier, hermeneutics for Ricoeur is nothing other than an attempt on the part of the reflecting subject to come to

grips with 'the desire to be' ('le désire d'être'), and there is, he says, a basic 'proximity between desire and speech'. In fact, the path to self-understanding, he says, 'lies in the speech of the other which leads me across the open space of signs'. Like Gadamer, Ricoeur believes that the condition for understanding and self-understanding is the linguistically mediated tradition to which we belong, 'the whole treasury of symbols transmitted by the cultures within which we have come, at one and the same time, into both existence and speech' (OI, 192–3).

At one point in his career,[35] Ricoeur equated hermeneutics with the interpretation of symbols, i.e., various double-meaning expressions such as stain, fall, wandering, captivity, and so on, the purpose of hermeneutics being that of explicating the non-literal meaning of these expressions, thereby recollecting and restoring the fullness of their symbolic meaning. In work undertaken subsequent to what he calls his 'linguistic turn', Ricoeur's view of the scope of hermeneutics expanded to include the entire range of human linguisticality, the issue of textuality in particular. Gadamer for his part devoted fully one-third of *Truth and Method* to a discussion of language. If 'all understanding is interpretation', it is equally the case, Gadamer insists, that 'all interpretation takes place in the medium of language'. Language, he says, 'is the universal medium in which understanding itself is realized' ([9.7], 350).

This is Gadamer's thesis concerning the 'linguisticality' *(Sprachlichkeit)* of experience, regarded by some as 'his most original contribution to the history of hermeneutics'.[36] As he formulates it, the thesis is a strong one:

> Linguistic interpretation is the form of all interpretation, even when what is to be interpreted is not linguistic in nature, i.e., is not a text, but is a statue or a musical composition. We must not let ourselves be confused by these forms of interpretation which are not linguistic, but in fact presuppose language.
>
> ([9.7], 360)

A natural reaction on the part of many readers is to object that, surely, we have experiences which are not linguistic in nature. As if in realization of the somewhat counter-intuitive nature of his thesis, Gadamer goes on to say:

> We must understand properly the nature of the fundamental priority of language asserted here. Indeed, language often seems ill-suited to express what we feel. In the face of the overwhelming presence of works of art the task of expressing in words what they say to us seems like an infinite and hopeless undertaking. It seems like a critique of language that our desire and capacity to understand always go beyond any statement that we can make. But this does not affect the fundamental priority of language.
>
> ([9.7], 362)

It is indeed necessary, as Gadamer says, to understand properly the nature of the priority being asserted here. Gadamer is not advocating a kind of *Sprachidealismus,* a linguistic idealism. He is not defending a metaphysical thesis to the effect that there is nothing outside of language or that everything can be reduced to language—as Derrida was

subsequently perceived to be saying ('Il n'y a pas de hors-texte'). The linguisticality-thesis does not *deny* the meaningfulness of non-linguistic modes of experience; rather it *affirms* that meaningfulness by maintaining that it can always, in principle, be brought to expression (can be interpreted) in language. If the pre-linguistic could not be so interpreted, it would indeed be meaningless to speak of it as having any meaning at all. Thus, as Gadamer says:

> language always forestalls any objection to its jurisdiction. Its universality keeps pace with the universality of reason. Hermeneutical consciousness is only participating in something that constitutes the general relation between language and reason. If all understanding stands in a necessary relation of equivalence to its possible interpretation and if there are basically no bounds set to understanding, then the linguistic form which the interpretation of this understanding finds must contain within it an infinite dimension that transcends all bounds. Language is the language of reason itself.
>
> ([9.7], 363)

Ricoeur too insists on this 'general relation between language and reason'. The operant presupposition or 'central intuition'[37] underlying his hermeneutical endeavours is that existence is indeed meaningful, that, notwithstanding the very real existence of unmeaning, necessity (unfreedom) and evil, there is in existence 'a super-abundance of meaning to the abundance of non-sense'.[38] The core of what could be called Ricoeur's philosophical faith is his belief in the *dicibilité,* the 'sayability', of experience. He formulates this 'wager for meaning' or this 'presupposition of meaning' in the following way: 'It must be supposed that experience in all its fullness…has an expressibility *[dicibilité]* in principle. Experience can be said, it demands to be said. To bring it to language is not to change it into something else, but, in articulating and developing it, to make it become itself ([9.15], 115).

Perhaps no more forceful statement could be adduced to highlight the fundamental difference between hermeneutics and other forms of postmodern philosophy which also emphasize the centrality of language but which proceed to draw from such a recognition conclusions of a philosophically agnostic sort (cf. Derrida's notions of *différance* and 'undecidability'). For hermeneutics the fact that our understanding of things is always *mediated* by language does not mean that language is a *barrier* preventing us from having genuine access to 'reality'. Precisely because of the linguisticality of understanding, hermeneutics insists that there is—'in principle', as Ricoeur would say—nothing that we might wish to understand which cannot, in one way or another, be brought to language. As Gadamer states: 'everything that is intelligible must be accessible to understanding and to interpretation. The same thing is as true of understanding as of language' ([9.7], 365). 'Every language', he maintains, '…is able to say everything it wants' ([9.7], 363). This of course is not to say that one could ever succeed in saying everything that there is to be said about anything; experience of the world is not only expressible, it is infinitely expressible and is, therefore, inexhaustible in its meaning.[39]

It should be noted that the hermeneutical 'postulate of meaningfulness', of expressibility, is not merely an article of (philosophical) faith but is based on an

ontological thesis as to the relationship between human understanding (what traditional philosophy would have called the 'mind') and reality. The thesis is one to which Gadamer gave the following succinct formulation: 'Being that can be understood is language' ([9.7], 432). Let us attempt to unpack this very provocative assertion.

What exactly the thesis as to the 'linguisticality of the world' means can perhaps best be grasped when it is reinserted in the phenomenological context from which it derives; for hermeneutics the relation between language and the world parellels the relation between consciousness and the world as described by Husserl. As was mentioned earlier, the 'phenomenological reduction' was the means by which Husserl sought to overcome the subject/object split of philosophical modernity. What the reduction served to reveal is the 'intentionality' of consciousness: 'all consciousness is consciousness *of* its object, *of* the world.' In other words, in being conscious, one is not first of all conscious of one's own consciousness and then, only subsequently, of an object; on the contrary, self-consciousness is derivative—'parasitical', even—upon an immediate consciousness of the object.[40] Consciousness is therefore not something we have to break out of in order to encounter the world. As Merleau-Ponty remarked, 'there is no inner man';[41] consciousness is 'always already' in a world and thus is itself a mode of being-in-the-world.

Transposed from the register of consciousness to that of language, the intentionality-thesis means that between language and the world there exists, as Gadamer puts it, a mutual belonging, an 'affiliation'. What language 'expresses' is nothing other than the world itself, and thus, as Gadamer says, 'language has no independent life apart from the world that comes to language within it' ([9.7], 401). Echoing, as it were, Heidegger's characterization of language as 'das Haus des Seins', the home of being, Gadamer insists on 'the intimate unity of word and object'. Objecting to 'the instrumentalist devaluation of language that we find in modern times' ([9.7], 365), Gadamer maintains that language is not simply a tool, 'a mere means of communication' ([9.7], 404). 'Language', he says, 'is not just one of man's possessions in the world, but on it depends the fact that man has a world at all.' By strict phenomenological logic, the conclusion follows: 'this world is linguistic in nature' ([9.7], 401). Thus, to speak of 'the nature of things' or of 'the language of things' is, Gadamer remarks, to use two expressions 'that for all intents and purposes mean the same thing' ([9.5], 69).

Like the notion of a fusion of horizons, the hermeneutical view of language is a dialectical concept resulting from a rejection of two alternative views of language. On the one hand, just as phenomenology rejects the modernist view of consciousness as a mere 'representation' of the 'external' world, so likewise hermeneutics rejects the modernist view of language as nothing more 'than a mere sign system to denote the totality of objects' ([9.7], 377). The words of a natural language, Gadamer insists, are not merely 'signs' that 'refer' to an alinguistic, pre-given reality. Words are not mere labels that we stick on things that are fully defined in themselves; they are the very means by which the things themselves exist for us. To say that language is the universal medium of our experience of the world means, practically or pragmatically speaking, that it is quite devoid of meaning to speak of a totally extra-linguistic reality. The age-old goal of transcending language in such a way as to coincide with reality as it is 'in itself, with a transcendental signified (as Derrida would say), is thereby shown to be a vain and

meaningless pursuit. Hermeneutics spells the 'end of metaphysics' when it insists that being itself is (to borrow a phrase from Jacques Lacan) 'structuré comme un langage', structured like a language.

On the other hand, hermeneutics also rejects not only modernism but also those postmodern views of language which, in addition to viewing language as a mere system of signs, maintain as well that the system is closed in upon itself and that it 'refers' to nothing other than itself—which is to say, to nothing 'real' at all. That indeed would be a form of linguistic idealism.

For hermeneutics, language is neither a mere tool nor an autonomous object in its own right; it is the medium of understanding itself, and all understanding is in the last analysis a form of self-understanding. Faithful to its origins in existential phenomenology, hermeneutics views language as the means whereby a speaking subject arrives at understanding in dialogue with other speaking subjects. For his basic model of linguistically-mediated understanding, Gadamer invariably takes as his privileged example what is itself an instance of language as *praxis: conversation (Gespräch)*.[42] He seeks, as he says, 'to approach the mystery of language from the conversation that we ourselves are' ([9.7], 340). Language, he says, 'has its true being only in conversation, in the exercise of understanding between people' ([9.7], 404). By 'conversation' Gadamer understands

> a process of two people understanding each other ['fusion of horizons']. Thus it is characteristic of every true conversation thateach opens himself to the other person, truly accepts his point of view as worthy of consideration and gets inside the other to such an extent that he understands not a particular individual, but what he says. The thing that has to be grasped is the objective rightness or otherwise of his opinion, so that they can agree with each other on the subject.
>
> ([9.7], 347)

We should note that, as Gadamer defines it, conversation is an instance of *dialogue*. What makes the conversation a dialogue is that it is not simply the intersection of two monologues; in a conversation there exists a genuine *commonality*. What makes for this commonality is not the individual 'subjectivities' of the interlocutors but rather what the conversation is 'about', 'what is being said', i.e., the 'topic' or 'subject' of the conversation or what Gadamer calls *die Sache,* that which is at issue (at play, *en jeu*) in the conversation.[43] As in a game situation, what guides and rules over the conversation is not the subjective intentions of the participants but 'the object to which the partners in the conversation are directed' ([9.7], 330). It should also be noted how the above definition of conversation also contains an implicit reference to the concept of truth, as hermeneutics conceives of it: truth (according to one reading of Gadamer's somewhat ambiguous remarks on the subject) is essentially the *agreement* that the interlocutors arrive at in the course of a conversation on the issue at stake.

Gadamer's portrayal of language under the aegis of conversation is typically 'ontological': it is part and parcel of his overall attempt to elaborate a philosophy (an ontology) of human understanding. However, privileging as it does the point of view of the speaking subject (or subjects), it bypasses the approach to language taken by the

science of linguistics and the methodological implications thereof. One of Ricoeur's chief preoccupations has been to remedy this situation by engaging in a debate with the objective science of language. Resisting Gadamer's separation of 'truth' from 'method', Ricoeur defines his own approach *vis-a-vis* that of Heidegger and Gadamer as wanting to contribute 'to this ontological vehemence an analytical precision which it would otherwise lack' (OI, 196).

Like Gadamer, Ricoeur holds to 'the conviction that discourse never exists *for its own sake,* for its own glory, but that in all of its uses it seeks to bring into language an experience, a way of living in and of Being-in-the-world which precedes it and which demands to be said' (OI, 196). However, he believes that it is not sufficient simply to assert this conviction but that it must be justified given what could be called the 'semiological' challenge. What exactly is this challenge?

For structural or Saussurian linguistics (from which philosophicalpoststructuralism was to draw much of its inspiration and, in particular, its rejection of the notion of 'the subject'), language is an autonomous system of differences, one of internal dependencies which are self-referential and self-defining. In this respect the system has no outside, only an inside, and, as a mere code, it is anonymous. This means that, from a 'semiological' point of view, language has neither subject nor meaning nor reference, nor, a fortiori, is it to be viewed as a means of communication. It would seem, therefore, that in their views on language hermeneutics and 'semiology' are irreconcilably opposed.[44]

Typically of his general approach to issues, Ricoeur has sought to arbitrate this dispute and to elaborate 'a new phenomenology of language which would take seriously the challenge of semiology, of structural linguistics, of all the "structuralisms"'.[45] He has done so by arguing that while on the micro level of phonological and lexical units the structuralist approach to language is, *qua* science, fully justified, it none the less fails to account for what is uniquely characteristic of language when one considers larger linguistic units, such as the sentence and, above all, the text. When language is considered no longer merely as an atemporal *system* of *signs* but as an *event* of *discourse,* as an 'actualisation of our linguistic competence in performance', it becomes apparent, Ricoeur argues, that language does indeed communicate something meaningful about the world to a subject attuned to it (see [9.15], 132ff.). As we shall see in the next section when considering the hermeneutical principles of text-interpretation, what a text communicates is indeed a *world,* i.e., a possible mode of being-in-the-world.

Ricoeur's debate or *Auseinandersetzung* with structural linguistics illustrates very well one of the persistent elements in his philosophizing. From his early work in philosophical anthropology (where he sought to overcome the idealist limitations of Husserl's philosophy of consciousness) to his current concern with textuality, semantic innovation and the narrative function, Ricoeur has throughout waged a philosophical battle on two fronts. While seeking to overcome all forms of modern subjectivism and, in particular, all psychologistic theories of meaning (e.g., those which equate meaning with authorial intention), he has consistently opposed various structuralist and poststructuralist attempts to get rid of the notion of subjectivity altogether. What Ricoeur has worked to articulate is a renewed, transformed and, above all, decentred notion of the subject, i.e., one which views subjectivity not as a metaphysical 'origin' of meaning but as the result ('effect') of its transformative encounter with the 'other'. If, as Habermas has done in a recent work,

we were to take as one of the more noteworthy traits of contemporary philosophy its critique of 'a self-sufficient subjectivity that is posited absolutely'[46] ('the philosophy of the subject', the 'philosophy of consciousness'), the hermeneutics of Gadamer and Ricoeur would stand out as exemplary in this regard. In its basic philosophical orientation—key elements of which we have surveyed in this section—hermeneutics is a prime instance of the general movement in twentieth-century philosophy which has been a movement away from the paradigm of (monological) consciousness to that of (dialogical) intersubjectivity. To insist, as hermeneutics does, on the effective-historical and linguistic nature of consciousness is, *eo ipso,* to insist on its intersubjective nature. To maintain that 'the goal of all communication and understanding is agreement concerning the object' ([9.7, 260) is to aim at a conception of meaning and truth which is neither objectivistic nor subjectivistic. Truth is not to be thought of objectivistically as 'correspondence' to some in-itself reality, nor is meaning to be thought of subjectivistically as something residing 'within' subjectivity itself. The attempt on the part of phenomenological hermeneutics to move decisively beyond both objectivism and relativism is especially evident in regard to its theories on text-interpretation, an issue to which we now turn.

THE HERMENEUTICAL THEORY OF TEXT INTERPRETATION

'The best definition for hermeneutics', Gadamer writes, 'is: to let what is alienated by the character of the written word or by the character of being distantiated by cultural or historical distances speak again. This is hermeneutics: to let what seems to be far and alienated speak again.'[47] As we have seen, however, Gadamer distances himself from the tradition of romantic hermeneutics by insisting that his 'philosophical' hermeneutics is not intended as a skilled procedure, a body of knowledge that 'can be brought under the discipline of consciously employed rules and thus be deemed a technical doctrine'. Rather, it is, as he says (borrowing a phrase from Habermas), a 'critical reflective knowledge', i.e., an attempt to articulate what is ontologically presupposed in all acts of text-interpretation which seek to bridge over cultural or historical distances.[48] As a *critical* reflection, it seeks to uncover 'the naive objectivism within which historical sciences, taking their bearings from the self-understanding of the natural sciences, are trapped'.

In regard to text-interpretation, the 'naive objectivism' to be uncovered and overcome is the belief that (as with respect to 'reality' naturalistically or scientistically conceived) texts contain within themselves (as Hirsch would say) a perfectly well-defined, determinate, selfsame, and unchanging meaning that it is the business of interpretation merely to lay bare. It goes without saying that this objectivistic view of 'knowledge' is thoroughly at odds with the philosophical theory of human understanding outlined above. How then, we may ask, does philosophical hermeneutics conceive of textual meaning and the business of interpretation?

The basic point can be stated fairly tersely: what interpretation seeks to understand is not the *intention* of the *author,* but the *meaning* of the *text*. To put the matter yet another way: textual meaning is not reducible to authorial intention. A 'good' text is precisely

one which has something to say to us, its readers, over and above what its author may (or may not) have intended and willed.[49] As Gadamer pointedly asks: 'Does an author really know so exactly and in every sentence what he means' ([9.7], 489)? 'The sense of a text', Gadamer says, 'in general reaches far beyond what its author originally intended.' And thus 'the task of understanding is concerned in the first place with the meaning of the text itself' ([9.7], 335).'[50] The task of interpretation is to develop or explicate these textual meanings—by means, as we shall see, of 'application'. The distinctive tenet of philosophical hermeneutics is that, as Gadamer says, *interpretation* is never simply *reproduction* ([9.7], 345).

Gadamer's rejection of authorial intention as the supreme criterion of textual meaning follows from his views on conversation. As we have seen, a genuine conversation is one wherein we are not preoccupied with 'reading the other person's mind' but are concerned, instead, with coming to a mutual understanding ('agreement') with him or her on the topic under discussion. For Gadamer, the same is, or ought to be, the case in our encounter with texts. Reading involves 'not a mysterious communion of souls, but a sharing of a common meaning'. The goal of interpretive understanding is not 'to recapture the author's attitude of mind but…the perspective within which he has formed his views' ([9.7], 259–60)—in other words, to join with him or her in a conversation on the issue at stake in the text. Such is the 'hermeneutic situation' with regard to texts.

To speak of 'conversation' is necessarily also to speak of a 'fusion of horizons'. What occurs in the act of reading or interpretation is a 'fusion' of the 'horizon' of the text (what Ricoeur calls the 'world of the text') with that of the reader. The meaning of the text is the result of this 'fusion'. Textual meaning is therefore nothing substantial in itself but exists rather in the form of an *event,* and this event is the act of reading.[51] If, as we have seen, there are no answers but to questions we ourselves pose, then it is the presupposition of 'fore-meanings' we bring to bear on a text which are decisive in what the text 'tells' us. 'The only "objectivity" here', Gadamer insists, 'is the confirmation of a fore-meaning in its being worked out' ([9.7], 237).

This of course is not to say that we are free to project our own presuppositions on to the text arbitrarily—this would precisely *not* be a conversation in the Gadamerian sense. Indeed, to the degree that in reading a 'fusion' actually does occur, to that very degree our own presuppositions are put at risk. The mark of arbitrary prejudices, Gadamer says, is that 'they come to nothing in the working-out' ([9.7], 237). This not infrequently happens. Our fore-meanings are often not confirmed but challenged, and it is precisely in this way that our own horizons are transformed, such that we gain in understanding. Not only is understanding, in the final analysis, a form of self-understanding, but all self-understanding is ultimately a matter of *self-transformation*. When we encounter a text or object whose newness is a challenge to our acquired presuppositions, what that object says to us is: 'You must change yourself.' Thus, in the act of reading, by means of the fusion of horizons effected thereby, we achieve an understanding of what is other by relating its horizon to our own; however, in order to do so, we are at the same time challenged to expand our own horizons, such that, through and by means of reading, our own selves are renewed. The postmodern paradigm of intersubjectivity under which philosophical hermeneutics operates is perhaps no more in evidence than here, in its theory of text-interpretation. 'Only through others', Gadamer says, 'do we gain true

knowledge of ourselves' (*PHC,* 107).

Another way of expressing this whole matter would be to say that all interpretation necessarily involves *application (Anwendung, applicatio)*. We can be said to have understood a text, grasped its meaning, only when we are able to relate ('apply') what it says to our own situation, our own historical horizon. Indeed, if there would be *no* way in which we could relate what a text says (what it means, 'wants to say', *veut dire*) to our own situation, if, in other words, there were no way we could *translate* the language of the text into our own historically conditioned language—then it would be meaningless to speak of our having to do with a *text* in the first place, i.e., something presumed to have *meaning*. We would have no more grounds for viewing the thing in question as a text than we would to view markings on the floor of the Peruvian desert as traces of alien subjectivities from outer space, rather than as mere curiosities of nature.

For Gadamer, the three moments of the 'hermeneutical situation'—understanding, interpretation and application—are inseparable. Just as understanding always involves interpretation, so also interpretation always includes the element of application. In asserting this interconnection ('the truly distinctive feature of philosophic hermeneutics', in the words of one commentator[52]), Gadamer is once again distancing himself from the tradition of romantic hermeneutics and, indeed, from the basic paradigms of modern epistemology in general. In linking together understanding, interpretation and application, he is rejecting outright the modernist view of 'knowledge' as correct 'representation' of an in-itself state of affairs. He is insisting, in a decidedly postmodern fashion, that all genuine knowledge is in fact *transformation*. Understanding, he maintains, is never merely 'a reproductive, but always a productive attitude as well…. It is enough to say that we understand in a different way, if we understand at all' ([9.7], 264). What that means in regard to text-interpretation is that, since understanding a text involves its application to the situation of the interpreter, it is necessarily the case that in changing circumstances a text is understood appropriately 'only if it is understood in a different way every time' ([9.7] 275–6). This is yet another inevitable consequence of linking up meaning with the event of understanding. If, indeed, understanding (truth) is itself in the nature of an event then, as Gadamer remar—provocatively, but with perfectly good reason none the less: 'the same tradition must always be understood in a different way' ([9.7], 278). An understanding of things which failed constantly to renew itself in this way—through 'application'—would be nothing more than (to borrow a phrase from Hegel) 'the repetition of the same majestic ruin'.[53]

It may be noted in passing that Gadamer's notions of the fusion of horizons and, consequent upon this, the transformative nature of understanding is enough to deflect one of the main criticisms often directed at his work, namely that it amounts to a form of cultural or intellectual conservatism. From what we have seen, it should be obvious that Gadamer's defence of tradition is in no way a paean to an incessant repetition of the same. If the 'same'—the tradition—is not always understood differently, it ceases to what Gadamer understands by 'tradition'. What are commonly referred to as 'traditional' societies—ones which seek to deny change and transformative becoming and to perpetuate inviolate a particular societal order—are precisely ones which are devoid of tradition in the Gadamerian sense, i.e., a *living* tradition animated by a 'historical consciousness'. The fact that language and its effective-history preforms our experience

of the world does not, Gadamer insists, 'remove the possibilities of critique'. 'Conversation' always holds open 'the possibility of going beyond our conventions' and ensures 'the possibility of our taking a critical stance with regard to every convention'. In short, tradition does not present 'an obstacle to reason' ([9.7], 495–6). Gadamer's response to charges of conservatism could not be more categorical:

> It is a grave misunderstanding to assume that emphasis on the essential factor of tradition which enters into all understanding implies an uncritical acceptance of tradition and socio-political conservatism…. In truth the confrontation of our historic tradition is always a critical challenge of the tradition.
>
> (*PHC,* 108)

Gadamer's position in this matter could be summed up in the following way: given the presuppositional nature of human understanding, the idea of a *total* critique of what has been handed down to us by tradition is utopic and is an existential impossibility, for the only way in which we can critically scrutinize certain presuppositions is by tacitly appealing to others. However, the fact that we stand always within tradition and cannot, for that reason, criticize everything *at once,* does not mean that there are things that cannot be criticized, as a cultural conservative might maintain. The fact of the matter is that, for Gadamer, there is nothing that cannot, at some time or other, be subjected to criticism in the light of reason. For Gadamer reason and tradition do not stand in an antithetical relation. 'Reason', he in fact says, 'always consists in not blindly insisting upon what is held to be true but in critically occupying oneself with it.'[54]

Thus, in contrast to intellectual conservatives such as Alasdair MacIntyre and Leo Strauss, Gadamer's trenchant critique of philosophical modernity is not intended to justify a return to an idealized, premodern, metaphysical past. When, as he often does, Gadamer makes use of notions drawn from the philosophical tradition, it is with the aim of articulating a decidedly post-metaphysical and post-foundationalist—which is to say, postmodern—theory of human being and understanding (albeit one which differs in important ways from other forms of postmodern thought in that it seeks to avoid their relativistic and nihilistic tendencies).

Gadamer's way of summing up his notion of application by saying that the 'same' tradition must always be understood 'in a different way' may strike one as being, to say the least, paradoxical. It would be meaningless indeed were Gadamer presenting his theory of interpretation as a *science* in the traditional sense of the term; from a scientific point of view the same conclusions should invariably follow from the same premises. Unlike Betti and Hirsch, however, Gadamer is not attempting to make of hermeneutics a science; indeed, he is resolutely turning his back on the age-old Platonic notion of science *(episteme)*. What he is arguing for is 'a knowledge that is not a science'.[55] In order to indicate what such a knowledge could be, Gadamer effectuates, in the course of his discussion of application, a creative retrieval of Aristotle's notion of *phronesis*.

P*hronesis* is the key concept in Aristotle's practical philosophy (ethics, politics) and is concerned with the crucial issue of how something *universal* is to be applied in *particular* circumstances. *Phronesis* designates a form of historically informed, prudential judgment which seeks to determine not what is eternally true or valid (as in mathematics) but, as

Gadamer would say, 'what is feasible, what is possible, what is correct, here and now' ([9.7], xxv). In opposition to Plato, Aristotle argued that in matters of practical reasoning (whose object is human action) there can be no hard and fixed rules which, as in logic, can mechanically generate particular decisions. In practical reasoning there is, as it were, a dialectical relation between the universal and the particular; the relation between the two is one not of logical subsumption but of codetermination. The universal in question (an ethical maxim, a law, a principle of political philosophy, and so on) is oriented entirely towards its application and has no real meaning apart from it—in that, precisely, its *raison d'être,* as a theoretical principle, is itself entirely practical, in that it is meant to serve as a guide to action—and yet the universal is not reducible to its particular applications, either, since no single application of the universal is unequivocally dictated by it and, consequently, can claim to exhaust it (to express its 'univocal' meaning). It is just this sort of reciprocal or codetermining relation, Gadamer holds, that obtains between a text (which, as something that is in a sense 'self-same', functions as a universal) and various interpretations ('applications') of it. He writes:

> The interpreter dealing with a traditional text seeks to apply it to himself. But this does not mean that the text is given for him as something universal, that he understands it as such and only afterwards uses it for particular applications. Rather, the interpreter seeks no more than to understand this universal thing, the text; i.e., to understand what this piece of tradition says, what constitutes the meaning and importance of the text. In order to understand that, he must not seek to disregard himself and his particular hermeneutical situation. He must relate the text to this situation, if he wants to understand at all.
>
> ([9.7], 289)

Gadamer's preferred model for text-interpretation is the interpretive activity of the jurist. 'Legal hermeneutics', he maintains, 'is able to point out what the real procedure of the human sciences is.' As he goes on to say:

> Here we have the model for the relationship between past and present that we are seeking. The judge who adapts the transmitted law to the needs of the present is undoubtedly seeking to perform a practical task, but his interpretation of the law is by no means on that account an arbitrary re-interpretation. Here again, to understand and to interpret means to discover and recognise a valid meaning. He seeks to discover the 'legal idea' of a law by linking it with the present.

From this Gadamer generalizes as follows:

> Is this not true of every text, i.e., that it must be understood in terms of what it says? Does this not mean that it always needs to be restated? And does not this restatement always take place through its being related to the present? …Legal hermeneutics is, then, in reality no special case but is, on the contrary, fitted to restore the full scope of the hermeneutical problem and so to retrieve the former

> unity of hermeneutics, in which jurist and theologican meet the student of humanities.
>
> ([9.7], 292–3)

It follows as a general conclusion that in text-interpretation it is altogether inappropriate—indeed, quixotic—to seek to determine the single correct interpretation of a text. However, it also follows, and with equal force, that in text-interpretation, as in practical reasoning in general, it is never the case that 'anything goes'. If hermeneutics is an instance of practical reasoning, as indeed Gadamer insists that it is—'The great tradition of practical philosophy lives on in a hermeneutics that becomes aware of its philosophic implications'[56]—this means that while it is never possible to *demonstrate* the validity of one's interpretations, it is nevertheless always possible to *argue* for them in cogent, non-arbitrary, indeed, prudent ways. As an instance of practical philosophy, hermeneutics is as remote from dogmatic scientism as it is from interpretive anarchism. It is precisely because hermeneutics is a practical philosophy in the Aristotelian sense of the term that it can legitimately claim to have transcended both objectivism and relativism.

Godamer's interest in practical philosophy has led him to explore the relationship between hermeneutics and rhetoric. The relationship between the two is both extensive and deep.[57] If it is the case that hermeneutical reasoning is not a form of scientific *demonstration* but of *persuasive argumentation* and that its object is not what is *certain* but what is *probable* or *likely,* then it is obvious that it is to traditional rhetoric—the theory of argumentation (in the words of Chaim Perelman[58])—that hermeneutics is obliged to look for its theoretical and methodological grounding. The scope of rhetoric, Gadamer says, is truly unlimited, and thus to the universality of hermeneutics corresponds the ubiquity of rhetoric. As he further remarks:

> Where, indeed, but to rhetoric should the theoretical examination of interpretation turn? Rhetoric from oldest tradition has been the only advocate of a claim to truth that defends the probable, the *eikos* (verisimile), and that which is convincing to the ordinary reason, against the claim of science to accept as true only what can be demonstrated and tested! Convincing and persuading, without being able to prove—these are obviously as much the aim and measure of understanding and interpretation as they are the aim and measure of oration and persuasion.
>
> ([9.5], 24)

Ricoeur shares with Gadamer the same basic approach to text-interpretation, the most common element in which is perhaps the attempt to work out a 'non-subjective' theory of meaning. However, there are some noticeable differences between these two leading representatives of phenomenological hermeneutics, differences not so much in substance, perhaps, as in what they choose to accentuate. Three such differences may be noted.

In the first instance, Ricoeur has always been uncomfortable with Gadamer's apparent dichotomizing of 'truth' and 'method'. Throughout his career Ricoeur has maintained a strong interest in the relationship between philosophy and the human sciences; accordingly, and in contrast to Gadamer, the focus of much of his attention has been on

specific methodological issues. While he fully subscribes to the basic ontological concerns of both Heidegger and Gadamer, he feels none the less that this particular preoccupation on their part has tended to prevent philosophical hermeneutics from entering into a serious dialogue with the more empirically oriented sciences. Reacting no doubt to Gadamer's somewhat underdefined notion of 'truth',[59] Ricoeur insists that questions of 'validation' cannot simply be bypassed. Gadamer's 'ontological' hermeneutics, he maintains, ignores the quite legitimate question of validation which so preoccupied romantic hermeneutics. In Ricoeur's eyes Gadamer develops not only the anti-psychologistic tendencies of Heidegger's philosophy but also, unfortunately, its anti-methodological tendencies as well. As a result, he says, a crisis is opened in the hermeneutical movement: 'in correcting the "psychologizing" tendency of Schleiermacher and Dilthey, ontological hermeneutics sacrifices the concern for validation which, with the founders, provided a balance for the divinatory aspect.'[60] Ricoeur distinguishes his own 'methodological' hermeneutics from Gadamer's 'ontological' hermeneutics by saying that it attempts to place 'interpretation theory in dialogue and debate with the human sciences'. It is not surprising, therefore, that—in his continuing attempt to mediate the 'conflict of interpretations'—Ricoeur should make an explicit attempt to incorporate Hirsch's concerns for validation into his own interpretation theory (though in a way which is hardly likely to have won Hirsch's allegiance to the cause of phenomenological hermeneutics).[61]

Another aspect of Gadamer's interpretation theory about which Ricoeur has expressed reservations is the conversation model on which Gadamer relies so extensively. In the light of his concern over the nature of textuality as such, Ricoeur argues that the relationship between reader and text is significantly different from that between two conversational partners. The latter should not be taken as a model for all instances of understanding, and it is definitely not appropriate for conceptualizing our relationship with texts: 'the dialogical model does not provide us with the paradigm of reading' ([9.15], 210).[62]

Far from viewing the act of reading as a kind of dialogue, we should, Ricoeur provocatively remarks, consider even living authors as already dead and their books as posthumous—for only then does the readers' relationship to the book become 'complete and, as it were, intact' ([9.15], 147). The reason for Ricoeur's saying this is the profound transformation that he believes writing has on language. Ricoeur defines a text as 'any discourse fixed by writing' ([9.15], 145). but with this 'fixation' something important happens: the text achieves, as it were, an 'emancipation with respect to the author' ([9.15], 139). More specifically, in writing, the *intention* of the author and the *meaning* of the text cease to coincide (in spoken discourse, Ricoeur holds, the intention of the speaker and the meaning of what he says overlap) (see [9.15], 200). In other words, when language is transformed into a text, it assumes a life of its own, independent of that of its author. As Ricoeur expresses the matter: 'the text's career escapes the finite horizon lived by its author. What the text says now matters more than what the author meant to say, and every exegesis unfolds its procedures within the circumference of a meaning that has broken its moorings to the psychology of the author' ([9.15], 201).

This leads directly into the third difference between Ricoeur and Gadamer to be noted in the present context, having to do with the notion of 'distantiation'. It will be recalled

how at the outset of the present section I quoted Gadamer as saying: 'The best definition for hermeneutics is: to let what is alienated by the character of the written word or by the character of being distantiated by cultural or historical distances speak again.' This remark might seem to imply that distantiation is a negative factor which it is the task of interpretation to overcome as much as possible. Ricoeur for his part appears to read Gadamer in this way; he perceives as 'the mainspring of Gadamer's work…the opposition between alienating distantiation and belonging'—an opposition reflected in the very title of Gadamer's *Truth and Method* ([9.15], 131). He sees Gadamer as wanting to renounce the concern of the human sciences for objectivity so as to reaffirm our 'belongingness' to the tradition. In opposition to this, Ricoeur states: 'My own reflection stems from a rejection of this alternative and an attempt to overcome it.'

The point that Ricoeur wishes to emphasize is that the phenomenon of textuality overcomes 'the alternative between alienating distantiation and participatory belonging' in such a way as to introduce 'a positive and, if I may say so, productive notion of distantiation.' Why is distantiation a 'productive function'? Distantiation is productive in that, in 'alienating' a text from its original context, it confers on the text a kind of 'autonomy', thereby freeing it for what is in fact its true vocation, namely, that of being 'reactualized' in ever new contexts (becoming in this way a genuinely 'living' text).[63] This reactualization (or recontextualization) is what Ricoeur calls 'appropriation' *(Aneignung)*. He prefers this term to 'application' *(Anwendung),* since it underscores the central role that the reader plays in regard to the text. To 'appropriate' means '"to make one's own" what was initially "alien"' ([9.15], 185). It is the reader's function to actualize ('make actual, real") the meaning of the text. A text is, by its very nature, addressed to someone, to 'an audience which extends in principle to anyone who can read' ([9.15], 139). In a very real sense, the text's audience is one 'that it itself creates' ([9.15], 202). In any event, without an audience (an addressee) to reactualize it, the meaning of a text would remain for ever 'undecidable', as Derrida has quite rightly remarked. Thus, for Ricoeur, 'reading is the concrete act in which the destiny of the text is fulfilled' ([9.15], 164)

Ricoeur's position in this matter is a strict consequence of his rejection of the psychologistic theory of meaning. The meaning of a text is its 'reference', but this is neither the psychological intention of the author nor an empirical state of affairs in the so-called 'objective' world ('ostensive reference'). The true referent of a text is what it is 'about', what Gadamer calls *die Sache,* the 'matter of the text'. Ricoeur calls this the 'world of the text'. He defines it as 'the ensemble of [nonsituational] references opened up by the text'—as when we speak of the 'world of the Greeks', meaning thereby not an empirical reality but a particular *understanding* of the world ([9.15], 202). The 'intended meaning of the text' is the 'world' that it discloses; the projecting of a world is 'the process which is at work in the text' ([9.15], 164).

For Ricoeur there is no text that does not express a 'world', that 'does not connect up with reality', no matter how fictional the text may be ([9.15], 141). In opposition to Roland Barthes, Ricoeur strenuously maintains that the language of texts does not merely 'celebrate itself. Poetry and novels may not refer to any merely empirical reality, but they most definitely do have a 'second-order reference'.[64] The central task of interpretation is that of explicating this higher-level reference; herein lies, according to Ricoeur, 'the

center of gravity of the hermeneutical question' ([9.15], 132), 'the most fundamental hermeneutical problem' ([9.15], 141):

> If we can no longer define hermeneutics in terms of the search for the psychological intentions of another person which are concealed *behind* the text, and if we do not want to reduce interpretation to the dismantling of structures [as in the structuralist, purely explanatory approach], then what remains to be interpreted? I shall say: to interpret is to explicate the type of being-in-the-world unfolded *in front of* the text.

This last remark provides a more precise indication of what Ricoeur means by the 'world of the work'. This 'world' is none other than Husserl's life-world or Heidegger's being-in-the-world. That is to say, the 'possible world' ([9.15], 218) unfolded in a text is nothing other than a *possible mode of being*. In other words, *it is a world which I, the reader, could (possibly) inhabit*. By opening up a world for us, a text provides us with 'new dimensions of our being-in-the-world' ([9.15], 202); it suggests to us new and different ways in which we ourselves could be. 'To understand a text', Ricoeur says, 'is at the same time to light up our own situation' ([9.15], 202). It is at this point that Ricoeur's theory of text-interpretation links up with his overriding concern to articulate a non-metaphysical concept of subjectivity, 'a new theory of subjectivity' ([9.15], 182).

The key point here is that in appropriating the meaning (the 'world') of a text, the reader—the self—reappropriates itself, acquires in effect a new self. 'What would we know of love and hate,' Ricoeur asks, 'of moral feelings and, in general, of all that we call the *self,* if these had not been brought to language and articulated by literature' ([9.15], 143)? The relation between text and reader is thus, as it were, a two-way street: the text depends on its readers for its actualization, but in the process of reading—giving the text a meaning—readers are themselves actualized ('metamorphosed')—given a self—by the text. In exposing ourselves to the text, we undergo 'imaginative variations' of our egos (see [9.15], 189) and receive in this way from the text 'an enlarged self, which would be the proposed existence corresponding in the most suitable way to the world proposed' ([9.15], 143). Thus, as Ricoeur remarks:

> In general we may say that appropriation is no longer to be understood in the tradition of philosophies of the subject, as a constitution of which the subject would possess the key. To understand is not to project oneself into the text; it is to receive an enlarged self from the apprehension of proposed worlds which are the genuine object of interpretation.
>
> ([9.15], 182–3)

It can thus be seen that while Ricoeur's interpretation theory situates the reader at the heart of the interpretive process, it does not legitimate any form of interpretational subjectivism; what it calls for is 'instead a moment of dispossession of the narcissistic *ego*' ([9.15], 192).[65] However, by linking up the understanding of meaning with self-understanding, it does illustrate in a striking way Ricoeur's basic philosophical motives which derive from the tradition of reflective (or reflexive) philosophy and, more

particularly, the concern for the 'self that he inherits from existentialism.[66] In all text-interpretation what is ultimately at stake is a self in search of self-understanding, in search of 'the meaning of his own life' ([9.15], 158). Thus Ricoeur writes: 'By "appropriation", I understand this: that the interpretation of a text culminates in the self-interpretation of a subject who thenceforth understands himself better, understands himself differently, or simply begins to understand himself ([9.15], 158). It is accordingly not surprising that when in the course of a famous debate Lévi-Strauss asserted that for him meaning is always phenomenal and that underneath meaning (conceived of as nothing more than the combination of elements meaningless in themselves) there is only non-meaning, Ricoeur should have insisted most strongly: 'If meaning is not a segment in self-understanding, I don't know what it is.'[67] The position that Ricoeur adopts in his consideration of the human sciences and, in particular, the explanation/ understanding debate is, as we shall see in what follows, dictated by this fundamental conviction.

HERMENEUTICS AND THE HUMAN SCIENCES: FROM TEXT TO ACTION

If Gadamer's major contribution to philosophical hermeneutics is to have provided it with a general theory of human understanding, Ricoeur's vital contribution to the discipline could perhaps be said to consist in his having drawn from this ontology of understanding *methodological* conclusions of direct relevance to the practice of the human sciences. In doing so, he has also addressed the key problem in the philosophy of the human sciences that Gadamer's hermeneutics tends to leave unresolved, namely, the problem of the relation between *explanation* and *understanding*.

What is it about hermeneutics, one might ask, that makes it especially relevant to the human sciences? Or, again, what is it about the human sciences that allows one to maintain that they themselves are most properly understood when viewed as a form of 'applied' hermeneutics? The proper objects of these disciplines might seem, on the face of it, to have very little in common: the traditional concern of hermeneutics is *texts,* whereas the proper object of the human sciences is human *action*. The human sciences are concerned with what people do, the meaning of what they do, why and how they do it, and the consequences of their doing what they do. Hermeneutics is concerned, at its core, with the right reading of texts. But perhaps, to be understood properly, human action needs also to be *read* in the right way. Perhaps the common element here is the notion of *meaning*.

What indeed constitutes the specificity of the human sciences *vis-à-vis* the natural sciences? The difference lies first and foremost in the respective objects of these sciences. What is unique about the objects of the human sciences is that these objects are also *subjects*. As three human scientists remark: 'the objects studied are subjects, embedded in cultural practices, who think, construe, understand, misunderstand, and interpret, as well as reflect on the meanings they produce.'[68] This difference in the objects (or subject matter) of the two kinds of science dictates a difference in *method* (it does, that is, if one adheres to Aristotle's injunction to the effect that a science should always adapt its method to the nature of the object under consideration). From a methodological point of

view, human *action* falls under a different category altogether than does mere physical *motion*. Motion can be 'explained' in purely mechanistic terms, in terms of physical cause and effect relations, but action cannot properly be 'understood' except in terms of *meaning*. As the object of a science, human agents are not only interpreted objects (as in the case of the natural sciences), they are also self-interpreting subjects. Phenomenologically speaking, what is unique about that entity called 'man' is that he is a self-interpreting animal (this is, of course, simply another way of saying that 'man' is the 'speaking animal'). What this all means is that (in the words of the hermeneutical anthropologist Clifford Geertz) 'man is an animal suspended in webs of significance he himself has spun' and that, accordingly, the analysis of human culture (understood as precisely those 'webs') is not 'an experimental science in search of [nomological-deductive] law but an interpretive one in search of meaning'.[69]

Human action is essentially meaningful (significative) in that action is, by definition and in contrast to purely physical systems, intentional, teleological or purposeful. Humans *act* in order to bring into being states of affairs that would not, or would not likely, prevail without their acting. If, for instance, humans engage in economic activities (the only species to do so), it is, as economist Ludwig von Mises has remarked, *in order to* improve their material position, to make their lives more liveable, more meaningful.[70] That human action is essentially meaningful can therefore be taken as an ontological (or phenomenological) fact. The crucial question, as concerns the human sciences, is a methodological one: if the human sciences cannot look to the natural sciences for their method (since the concept of meaning or purpose is itself meaningless in a purely physicalistic or mechanistic context), where are they to look? This is where hermeneutics comes in.

In a famous article, 'The Model of the Text: Meaningful Action Considered as a Text', Ricoeur addressed the above mentioned question. Meaningful action, he said, can be the object of a science only if the meaning of action is 'objectified' in a way equivalent to that in which the meaning of discourse is 'fixated' by writing (see [9.15], 203)—only if, in other words, action can properly be viewed as a text-analogue (a 'quasi text'). Ricoeur maintains that this is indeed the case. He writes:

> In the same way that a text is detached from its author, an action is detached from its agent and develops consequences of its own. This autonomisation of human action constitutes the *social* dimension of action. An action is a social phenomenon…because our deeds escape us and have effects which we did not intend. One of the meanings of the notion of 'inscription' ['fixation'] appears here. The kind of distance which we found between the intention of the speaker and the verbal meaning of a text occurs also between the agent and its action.
>
> ([9.15], 206)

This is an important text, in that it specifies clearly that aspect of meaningful human action which makes of it the proper object of a *social* science: as in the case of texts, the meaning of action is not reducible to the psychological intentions of the agents themselves. The meaning of what people do displays an autonomy similar to that of texts in regard to their authors' intentions. Thus here too the notion of meaning must be

'depsychologized' or 'desubjectivized'. The proper objects of the social sciences are various social *orders* (the equivalent of texts) which are the *result* of human action—the result, it must be added, of human action but not necessarily of human design.[71] As Ricoeur remarks: 'our deeds escape us and have effects which we did not intend.' Our deeds escape us in the same way that the text's career escapes the finite horizon of its author. Strictly speaking, therefore, the meaningful action or, better expressed, the meaningful *patterns of action* that the social sciences seek to understand are *neither* subjective *nor* objective (in the purely physicalistic sense of the term). As the Canadian hermeneuticist Charles Taylor has emphasized, we are dealing here with meanings which are not subjective (residing in the heads of the actors) but rather *intersubjective*. 'The meanings and norms implicit in these practices', Taylor observes, 'are not just in the minds of the actors but are out there in the practices themselves, practices which cannot be conceived as a set of individual actions, but which are essentially modes of social relation, of mutual action.'[72] Although, as Ricoeur reminds us, it is only individuals who do things, it is nevertheless also the case that human action is meaningful—and thus understandable—only in terms of a shared public world.[73] As one psychotherapist observes:

> The meaning of action can be read from the directedness of the action seen within the pattern of practices that constitute the individual's social milieu. It is these practices, and not any representations in the individual's head, that determine the meanings attributable to the individual. The background of social practices and cultural institutions give specific objects and actions—and even mental representations when they do occur—their meanings.[74]

Another way of expressing the matter would be to say that just as what constitutes a text is that it has a certain 'logic' which it is precisely the task of text-interpretation to lay bare (Ricoeur speaks in this regard of 'the internal dynamic which governs the structuring of the work' (OI, 193)), so also there is a certain objective logic to human events or practices which it is precisely the task of social science to explicate. The social orders or 'wholes' that social scientists (anthropologists, economists, historians, etc.) seek to render intelligible possess their own unique ontological status in that their mode of being is *neither* psychological *nor* physical; it is, as Merleau-Ponty would say, an 'ambiguous' mode of being, neither that of the for-itself nor that of the in-itself. These wholes are indeed *objective* (or incarnate) *logics,* which exist as the sedimented results (in the form, ultimately, of sociocultural *institutions*) of the activities of a myriad of individual human agents, each of whom was pursuing meaning in his or her own life. If this is indeed the case, the crucial methodological question becomes: what method is most appropriate to the task of explicating these logics?

From what has been said, it should be evident that a purely *descriptive* approach (in terms of mental states) is no more appropriate than would be a purely 'explanatory', cause-and-effect approach; in both cases the object to be understood—meaning embedded in intersubjective practices—would be lost sight of. Human agents are self-interpreting beings, but it is not the task of a social science simply to 'describe' these interpretations. It is not their task, if it is indeed the case that the meaning of action

surpasses the intentions of the actors themselves. The function of interpretation cannot simply be that of *Verstehen* in the classical sense of the term, i.e., that of articulating the self-understanding of human actors, in such a way as to achieve an empathetic understanding of them. The unavoidable fact of the matter is that the human sciences are *doubly interpretive;* they are interpre-tations of the interpretations that people themselves offer for their actions. As Clifford Geertz has observed: 'what we call our data are really our own constructions of other people's constructions of what they and their compatriots are up to.'[75] The fact that the proper object of social science is the logic of *practices* and not merely the psychological intentions of actors means that social scientists often have to discount the self-interpretations of the actors themselves.[76] Ricoeur has long insisted that the consciousness that we have of ourselves is often a false consciousness, which means that the hermeneutical enterprise must include as one of its moments, a 'hermeneutics of suspicion'.

This amounts to saying that the role of an interpretive social science is necessarily *critical*. The fact that there is inevitably a certain non-coincidence between the interpretations worked out by the social scientist and the self-interpretations proffered by the actors themselves means that there exists, in the words of John B.Thompson, a 'methodological space for…*the critical potential of interpretation*'.[77] Because there is always, to one degree or another, a certain *décalage* or discrepancy between what people do and what they say they do, critique is in fact integral to interpretive understanding, and this is why philosophical hermeneutics can, with Habermas in mind, insist on the *emancipatory* function of interpretive theory.

In conceptualizing the interpretive function in a way such as this, Ricoeur is able, he believes, to resolve the long-standing conflict between 'explanation' and 'understanding' (Gadamer had already portrayed Dilthey's dichotomizing distinction as a relic of the Cartesian dualism which has infected all of modern thought).[78] From what has been said, it is obvious that interpretation cannot be reduced to 'understanding', in the narrow (empathetic) sense of the term. Indeed, precisely because the meaning of human action is not 'subjective', there is, Ricoeur maintains, a legitimate, albeit strictly limited, place for explanatory techniques of a purely objective nature in the overall interpretive process. If (as in psychotherapy, for instance) meaningintentions are not open to, or cannot be exhaustively grasped by, direct inspection, and thus cannot simply be described 'from within', but must be deciphered and interpreted, as it were, 'from without', it follows that there is, by principle and of necessity, a rightful place for 'explanation' (in the traditional sense of the term) in the human sciences.

Just as, in the case of text-interpretation, it may be useful at the outset to approach a text in a purely objective way, in terms of an analysis of its formal structure or computer analysis of word distribution, for instance, so also, in an attempt to understand human action, an objective approach, e.g., in terms of statistical analysis, may alert social scientists to the existence of patterns they might otherwise over-look. What Ricoeur wishes nevertheless to emphasize is that the intelligibility provided by purely explanatory techniques is essentially partial and one-sided. The phenomena themselves cannot properly be understood, in the last analysis, until the results of the explanatory approach are integrated into a wider, interpretive understanding. For Ricoeur, 'explanation' amounts to a *methodological distantiation* from what is 'said' in the text (the 'world of

the text'), but, unlike Gadamer (in Ricoeur's view), he holds that this is a proper, and even necessary, moment in the overall process of understanding, conceived of, in the last analysis, as 'appropriation'. With Ricoeur there is, therefore, as one commentator says, a 'dialectic of an understanding which takes the detour of methodic distantiation so as to return to understanding'.[79]

Ricoeur's strategy in this regard consists in locating 'explanation and understanding at two different stages of a unique *hermeneutical arc*' ([9.15] 218), integrating thereby the opposed attitudes of explanation and understanding within an overall conception of interpretation as the recovery of meaning. In accordance with his hermeneutical conviction that all understanding is ultimately a form of self-understanding, Ricoeur maintains that, as he says, 'the final brace of the bridge [is] anchorage of the arch in the ground of lived experience' ([9.15], 164). In accordance as well with his underlying existential motivations, Ricoeur also insists that social structures are 'attempts to cope with existential perplexities, human predicaments and deep-rooted conflicts' ([9.15], 220). Thus, the ultimate goal of the social sciences is no different from that of text-interpretation, namely 'appropriation', a heightened understanding of the meaning of our being-in-the-world. 'We are not allowed', Ricoeur insists, 'to exclude the final act of personal commitment from the whole of objective and explanatory procedures which mediate it' ([9.15], 221). In applying Ricoeur's notion of the 'fixation' or 'inscription' of meaning to the study of cultures, Clifford Geertz for his part insists that the ultimate concern of the anthropologist is 'the existential dilemmas of life' and that the 'essential vocation' of interpretive anthropology is that of making 'available to us answers that others, guarding other sheep in other valleys, have given, and thus to include them in the consultable record of what man has said'.[80]

Ricoeur has long maintained that human phenomena—texts, action—cannot properly be understood until the results of the explanatory approach have been integrated into a wider, interpretive understanding. In his latest work culminating in his three-volume study *Time and Narrative* (1983–8), he has argued that the attempt to understand the specifically human must, in the final analysis, assume the form of a *narrative*. To the teleological nature of action, discussed above, corresponds the plot structure of narrative.[81] 'Objective data' (that is, the data that are produced as a result of the application of objective measuring techniques) achieve their maximum intelligibility not when, as is the goal of the natural sciences, they have been subsumed under (supposedly) binding and timeless 'covering laws' (whose putative purpose is that of 'explanation' and 'prediction') but when, as in history or psychotherapy, they have been interrelated and integrated into a narrative account, one which, precisely, confers meaning on them through narrative emplotment. For Ricoeur, the most primordial of all forms of understanding is thus that of story-telling. He writes:

> to follow a story is to understand the successive actions, thoughts and feelings as displaying a particular *directedness*. By this I mean that we are pushed along by the development and that we respond to this thrust with expectations concerning the outcome and culmination of the process. In this sense, the 'conclusion' of the story is the pole of attraction of the whole process. But a narrative conclusion can be neither deduced nor predicted. There is no story

> unless our attention is held in suspense by a thousand contingencies. Hence we must follow the story to its conclusion. So rather than being *predictable,* a conclusion must be *acceptable*. Looking back from the conclusion towards the episodes which led up to it, we must be able to say that this end required those events and that chain of action. But this retrospective glance is made possible by the ideologically guided movement of our expectations when we follow the story. Such is the paradox of the contingency, 'acceptable after all', which characterises the understanding of any story.
>
> ([9.I5], 277)

As Kierkegaard pointed out, understanding comes always only after the event, and, as Ricoeur has sought to show, the full measure of whatever understanding is available to us is made possible not by formalistic modes of explanation but by retrospective, narrative emplotment. Ricoeur has developed his theory of the narrative function primarily with respect to historiography,[82] but it can be, and has been, extended to other human sciences.[83] If Gadamer has argued for the universality of hermeneutics on the grounds that hermeneutics is concerned with the entire range of human *linguisticality*—which, in turn, is coextensive with 'being that can be understood'—Ricoeur advances this claim even further when, in his later writings, he maintains that the object of hermeneutics is *textuality,* and that this notion is coextensive with human existence itself. As one commentator remarks: 'Hermeneutics is concerned with the interpretation of any expression of existence which can be preserved in a structure analogous to the struc-ture of the text…. Taking it to the limit, the entirety of human existence becomes a text to be interpreted.'[84]

As Ricoeur's work on narrative clearly demonstrates, good history shares many of the same traits as good fiction. In showing how understanding is ultimately a form of story-telling—and in undermining in this way the modernist opposition between the 'real' and the 'imaginary'—Ricoeur has also shown how hermeneutical truth is itself a result of the *productive imagination*.[85] For Ricoeur the poetic imagination (the means whereby that 'higher order referent' he calls the 'world of the text' is brought into being) is necessarily a 'subversive force' in regard to what is customarily (or traditionally) taken to be 'real'. If Ricoeur stresses the role of the imagination in the overall understanding process, it is because he perceives this to be a strategic means of defending hermeneutics against Habermas's charge that it is inherently 'conservative'. The hermeneutics of the text conceived of as a 'hermeneutics of the power-to-be' (and thus as a critique of the illusions and false consciousness of the subject) would itself, he argues, provide the necessary underpinnings for a critique of ideology [9.15], 94). Of particular interest to Ricoeur is the theme of the 'social-imaginary' ('l'institution imaginaire de la société', in the words of Cornelius Castoriadis), an interest which testifies to his overriding concern with social and political, i.e., practical, philosophy—a concern shared by Gademer, as we shall see in what follows.[86]

HERMENEUTICS AND PRACTICAL PHILOSOPHY: ETHICAL AND POLITICAL IMPLICATIONS

The ultimate task of hermeneutical reflection consists in explicating the values that inform and guide hermeneutical practice itself. These are values that are inherent in the 'hermeneutical experience' (as Gadamer calls it), i.e., in that most natural and universal of all human activities: the persistent attempt on the part of humans to achieve understanding, self-understanding, and, above all, mutual understanding. In articulating these values, hermeneutics seeks to do no more than to spell out the (practical) 'conditions of possibility' of the interpretive-communicative process itself. It may be noted that the values arrived at in this way are the core values of traditional liberal theory: tolerance, reasonableness, the attempt to work out mutual agreements by means of discourse ('conversation') rather than by means of force.[87] The values in question are ones that Gadamer would call 'principles of reason'—in that they are integral to communicative understanding or rationality.

Hermeneutical values are those having to do with respect for the freedom and dignity of one's conversational partners, one's fellow dialogical beings. A fundamental value in this regard is that of *equality*. Since for an agreement to count as 'true'—from the viewpoint of communicative rationality—it must be reached by non-coercive means, the right of dialogical partners to equal and fair consideration cannot rationally be denied. The hermeneutical notion of 'good will'[88] points to a core precept of democratic pluralism: the other may possibly be right over against oneself and thus must be accorded a freedom equal to one's own. Of all the principles of reason, the highest is of course *freedom* itself. In the course of a discussion of Hegel, Gadamer asserts:

> There is no higher principle of reason than that of freedom. Thus the opinion of Hegel and thus our own opinion as well. No higher principle is thinkable than that of the freedom of all, and we understand actual history from the perspective of this principle: as the ever-to-be-renewed and the never-ending struggle for this freedom.
>
> ([9.6], 9)

Freedom is the highest 'principle of reason' in that (as the theory of argumentation—the 'new rhetoric'—has shown) no one can claim to be 'reasonable' if he or she denies freedom of opinion and expression to others. No one, that is, can deny this freedom without undermining his or her own demand for due consideration (recognition) that is implicit in the expressing of any opinion whatsoever, and without thereby ostracizing himself or herself from collective or intersubjective deliberations as to what is true and right. For Gadamer *freedom* and *reason* are inseparable concepts; freedom is precisely the freedom (the right) to possess a meaningful voice in the common dialogue, in that 'conversation' which is constitutive of our humanity.

In advocating the 'freedom of all' as the highest principle of reason, Gadamer, it will be noted, is defending the *universality* of certain basic human values. Here again is an illustration of how hermeneutics differs in a most important way from other forms of anti-foundational postmodernism; unlike them, hermeneutics does not believe that a rejection of objectivism need entail an anti-humanist relativism. To the universality of human linguisticality corresponds the universality of certain basic human rights. 'It is no longer possible', Gadamer insists, 'for anyone still to affirm the unfreedom of

humanity' ([9.6], 37). Unlike Heidegger and recent poststructuralists, both Gadamer and Ricoeur defend the tradition of philosophical and political humanism.[89]

It may be noted as well that hermeneutics' defence of normative universalism is what allows for the possibility of a *philosophical or rational critique* of existing practices. 'The task of bringing people to a self-understanding of themselves', Gadamer says, 'may help us to gain our freedom in relation to everything that has taken us in unquestioningly' ([9.6], 149–50). To the degree that this or that form of human community fails to embody the universal values of communicative rationality, it is a legitimate object of critique. To fail to expose various forms of 'social irrationality' ([9.6], 74) for fear of being accused of 'ethnocentrism' and, more specifically, of 'Eurocentrism' would, hermeneutics believes, amount to nothing less than a betrayal of reason.[90]

This is yet another reason why Gadamer's own version of hermeneutics is improperly understood when, as is often the case, it is thought to entail 'an uncritical acceptance of tradition and sociopolitical conservatism' (*PHC,* 108). Richard Bernstein is one commentator who has clearly perceived the 'radical' element in Gadamer's hermeneutics that follows from its stress on practical philosophy. Bernstein notes how, in attempting to draw out the practical consequences of philosophical hermeneutics, Gadamer appropriates from Hegel the principle of freedom ('a freedom that is realized only when there is authentic mutual "recognition" among individuals'), and he remarks: 'This radical strain is indicated in his emphasis—which has become more and more dominant in recent years—on freedom and solidarity that embrace all of humanity.'[91]

Although he meant it as a criticism, Stanley Rosen was quite right when he said: 'Every hermeneutical program is at the same time a political manifesto or the corollary of a political manifesto.'[92] Gadamer openly acknowledges this when he characterizes hermeneutics as *scientia practica sive politica*.[93] Hermeneutical philosophy is inevitably political—to the degree, that is, that it is a form of practical philosophy, which is to say, to the degree that it privileges practical reason, *phronesis,* dialogue. In addition, hermeneutical politics inevitably assumes the form of what Ricoeur calls 'political liberalism'. 'This apologia of dialogue', he says, 'implies, in the context of politics, an unremitting censure of tyranny and authoritarian régimes, and a plea for discussion as also for the free expression and unrestricted interplay of all shades of opinion.'[94] In many of his shorter writings after *Truth and Method* Gadamer returns again and again to socio-political issues, defending the values of communicative rationality and denouncing the subtle forms of oppression that tend to subvert these values in an age dominated by science and technology and a purely instrumentalist conception of reason. 'It is the function of hermeneutical reflection, in this connection [the conservation of freedom],' Gadamer says, 'to preserve us from naïve surrender to the experts of social technology' ([9.5], 40).[95]

The term used by Gadamer to refer to the normative ideal defended by hermeneutics is *solidarity*. What 'practice' means, Gadamer says, 'is conducting oneself and acting in solidarity. Solidarity…is the decisive condition and basis of all social reason' ([9.6], 87). The task incumbent upon hermeneutics is a universalist one; it is, as Gadamer might say, that of 'reawakening consciousness of solidarity of a humanity that slowly begins to know itself as humanity' ([9.6], 86). The solidarity advocated by Gadamer is not, it

should clearly be noted, one based solely on ethnic or cultural commonalities *(Gemeinschaft,* 'culture'). What he means by solidarity is, rather, 'rational identification with a universal interest', with 'the universals of law and justice'.[96] Unlike present-day communitarians of either the left or the right, Gadamer is not extolling the virtues of any particular ethos or way of life ('community'), purely as such; he is arguing for the need for a genuine, philosophical (and thus universalist) *ethics*. The relation here between ethics *(Moralität)* and ethos *(Sittlichkeit)* parallels the more general relation between 'understanding' (the universal) and 'application' (the particular) discussed above; the former requires the latter, but is not reducible to it.[97] Practical reason is indeed a form of *reason,* which means that it makes a claim to *universality*.[98] In the final analysis, the solidarity Gadamer defends is the solidarity of *reason* seeking 'general agreement';[99] it is the solidarity of mutual recognition *(Anerkennung)* binding together the citizens of a liberal society *(Gesellschaft),* i.e., a polity, or what Kant called 'a universal civic society',[100] founded upon the rational idea of human rights and universal freedom.[101]

In opposition to anarchism in both its leftist and rightist versions (the latter sometimes referred to as 'anarcho-capitalism'), hermeneutics insists that for freedom and solidarity to prevail in practice liberal *institutions* are required (or what Gadamer refers to as 'moral and human arrangements built on common norms'.)[102] As Merleau-Ponty had already pointed out, invoking the name of Hegel: 'freedom requires something substantial; it requires a State, which bears it and which it gives life to.' The essential thing is the existence of 'institutions which implant this practice of freedom in our customs *[moeurs]*'.[103] Ricoeur reiterates this point. In the Hegelian view that Ricoeur adopts, an 'institution' is the 'whole of the rules relating to the acts of social life that allow the freedom of each to be realized without harm to the freedom of others'.[104] Ricoeur refers to this institutional set-up as 'un Etat de droit', i.e., the liberal-democratic state or the rule of law. Such a state is democratic in that it 'does not propose to eliminate conflicts but to invent procedures permitting them to be expressed and to remain negotiable. The State of Law, in this sense,' Ricoeur goes on to say, 'is the State of organized free discussion.' Ricoeur refers in this connection to Hegel's definition of the most rational state as 'the State in which each would be recognized by all'.[105] In arguing for 'a synthesis of freedom and institution' Ricoeur is expressly arguing against those contemporaries of his—referred to by some as the 'philosophers of '68'[106]—who exalt a kind of 'liberté sauvage' outside of any institutional framework and who denounce institutions as being essentially coercive and repressive. And he insists that 'it is only in the form of the liberal State that this synthesis [of freedom and institutions] can be seen at work in the depths of history'.[107] The liberal-democratic state defended by hermeneutics is, one could say, nothing other than the institutionalization of (dialogical) reason. In this connection Richard Bernstein describes the practical task of hermeneutics as that of fostering 'the type of dialogical communities in which *phronesis* becomes a living reality and where citizens can actually assume what Gadamer tells us is their "noblest task"—"decision-making according to one's own responsibility—instead of conceding that task to the expert"'.[108] What democratic theory has long referred to as the 'common good' is in fact nothing other than an order of social institutions binding people together, one whose *raison d'être* is to facilitate and encourage in them the exercise of practical-dialogical reason ('solidarity').

In conclusion, it is apparent that philosophical or phenomenological hermeneutics not only provides a general theory of human understanding in its various modes, it also prescribes very specific tasks in the realm of socio-political *praxis*. With the recent demise of anti-liberal socialism and the triumph of democratic values throughout much of the world, 'the end of history' is said by some to have occurred. Although Gadamer too does not see any alternative to liberalism, he is under no illusions as to the ultimate triumph of freedom and reason in history. He agrees with Hegel that it is no longer possible for anyone (rationally) to deny the supreme value of the freedom of all. 'The principle that all are free never again can be shaken.' It cannot be shaken to the degree that the principle is, precisely, a principle of reason. However, he adds:

> But does this mean that on account of this, history has come to an end? Are all human beings actually free? Has not history since then [Hegel's time] been a matter of just this, that the historical conduct of man has to translate the principle of freedom into reality? Obviously this points to the unending march of world history into the openness of its future tasks and gives no becalming assurance that everything is already in order.
>
> ([9.6], 37)

The task of realizing freedom in history is like the task of understanding and self-understanding itself—it is an endless task. 'To exist historically', Gadamer says in reply to Hegel, 'means that knowledge of oneself can never be complete' ([9.7], 269). Like humanism or the belief in the 'subject'—the human subject in search of meaning in his or her own life and, as such, the bearer of basic human rights—hermeneutics or the belief in meaning in history must recognize, as Ricoeur says, that it is without metaphysical foundations, that it is a wager, a cry.[109]

NOTES

1 The term was apparently first used by J.C.Dannhauer in his *Hermeneutica sacra sive methodus exponendarum sacrarum litterarum* (1654).

2 F.Schleiermacher, *Hermeneutics: The Handwritten Manuscripts,* ed. H.Kimmerle, trans. J.Duke and J.Forstman (Missoula: Scholars Press, 1977), p. 93.

3 Both Gadamer and Ricoeur concur in ascribing to Schleiermacher a 'psychologistic' view of understanding of the sort described here. This interpretation has been challenged, however, by Manfred Frank; see his *What is Neostructuralism?,* trans. S.Wilke and R.Gray (Minneapolis: University of Minnesota Press, 1989), pp. 8–9.

4 See C.G.Hempel, 'The Function of General Laws in History' (1942), reprinted in *Theories of History,* ed. P.Gardiner (New York: Free Press of Glencoe, 1959), pp. 344–56.

5 See P.Winch, *The Idea of a Social Science and Its Relation to Philosophy* (London: Routledge & Kegan Paul, 1958), as well as his articles 'The Idea of a Social Science' and 'Understanding of a Primitive Society', both in *Rationality,* ed. B.R.Wilson (New York: Harper Torchbooks, 1971).

6 R.J.Bernstein [9.29], 30.

7 'Phenomenological hermeneutics' aptly designates the hermeneutics of Gadamer and

Ricoeur since, as I shall indicate in more detail below, their thought is rooted in the phenomenology of Edmund Husserl and Martin Heidegger. Ricoeur has said of his own position: 'it strives to be a *hermeneutical* variation of this [Husserl's] phenomenology' ('On Interpretation' in A.Montefiore (ed.), *Philosophy in France Today* (Cambridge: Cambridge University Press, 1983), p. 187; hereafter cited in the text as *OI*). On another occasion Ricoeur stated: 'I do not believe that hermeneutics replaces phenomenology. It is only opposed to the idealist interpretation of phenomenology' ('Response to My Friends and Critics' in C.E.Reagan [9.25], no page no.).

8 Tübingen: J.C.B.Mohr; see also his earlier encyclopaedic work, *Theoria generale della interpretazione,* 2 vols (Milan: Dott. A.Giuffrè, 1955).

9 E.D.Hirsch, Jr, *Validity in Interpretation* (New Haven: Yale University Press, 1967).

10 See *Validity,* p. 264: 'The much-advertised cleavage between thinking in the sciences and the humanities does not exist. The hypothetico-deductive process is fundamental in both of them, as it is in all thinking that aspires to knowledge.'

11 A particularly mean-spirited attack against Gadamer along these lines was published by J.Barnes: 'A Kind of Integrity', *London Review of Books,* 6 Nov. 1986, pp. 12–13.

12 As Ricoeur recently pointed out in response to the Canadian hermeneuticist Jean Grondin, hermeneutic's polemical opposition to objectivism is an integral part of hermeneutics as it is of the Husserlian phenomenology from which it derives. 'L'herméneutique…est polémique', Ricoeur says, 'parce que la *compréhension* dont elle s'autorise doit sans cesse se reconquérir sur diverses figures de la *méconnaissance*' (Ricoeur, 'Réponses' in C.Bouchindhomme and R.Rochlitz (eds), *'Temps et récit' de Paul Ricoeur: en débat* (Paris: Editions du Cerf, 1990), pp. 201–2).

13 Gadamer here refers in a note to Betti's work.

14 Hans-Georg Gadamer, *Truth and Method* [9.7], xvi.

15 This was in fact the title given to an edited collection of essays by Gadamer published in 1976: *Philosophical Hermeneutics* ([9.5]).

16 For a detailed treatment of this issue see 'Ricoeur and the Hermeneutics of the Subject' in Madison [9.34]; forthcoming also in *The Philosophy of Paul Ricoeur* (Library of Living Philosophers), ed. I.E.Hahn. For a good overview of the basic themes in Ricoeur's philosophizing, centred on the notion of the subject, see John W.Van Den Hengel [9.27]. Van Den Hengel includes in his study a remarkably extensive bibliography (483 titles) of Ricoeur's writings from 1935 to 1981.

17 Husserl provides a historical reconstruction of the modernist tradition to which he is opposed in *The Crisis of European Sciences and Transcendental Phenomenology: An Introduction to Phenomenological Philosophy,* trans. D. Carr (Evanston: Northwestern University Press, 1970).

18 See E.Husserl, *The Idea of Phenomenology,* trans. W.P.Alston and G. Nakhnikian (The Hague: Martinus Nijhoff, 1964), lecture I.

19 The phrase is that of Ludwig Landgrebe, one of Husserl's late assistants. See his 'Husserl's Departure from Cartesianism', in R.O.Elveton (ed.), *The Phenomenology of Husserl* (Chicago: Quadrangle Books, 1970), p. 261.

20 Cf. Ricoeur, 'On Interpretation' (see note 7), p. 190: 'The theme of the *Lebenswelt,* a theme which phenomenology came up against in spite of itself, one might say, is adopted by post-Heideggerian hermeneutics no longer as something left over, but as a prior condition.'

21 See M.Merleau-Ponty, *Phenomenology of Perception,* trans. C.Smith (London: Routledge & Kegan Paul, 1962), p. xiv: 'Far from being, as has been thought, a procedure of idealistic philosophy, phenomenological reduction belongs to existential philosophy: Heidegger's

"being-in-the-world" appears only against the background of the phenomenological reduction.'

22 M.Heidegger, *Being and Time,* trans. J.Macquarrie and E.Robinson (New York: Harper & Row, 1962), p. 90: hereafter cited in the text as *BT*.

23 Ricoeur, *Hermeneutics and the Human Sciences* [9.15], 87.

24 'In it [interpretation] the understanding appropriates understandingly that which is understood by it' (*BT,* 188).

25 Ricoeur, 'The Question of the Subject', in D.Ihde (ed.), *The Conflict of Interpretations:Essays in Hermeneutics* (Evanston: Northwestern University Press, 1974), p. 266 (translation corrected).

26 Gadamer, 'The Problem of Historical Consciousness', in P.Rabinow and W. M.Sullivan (eds), *Interpretive Social Science: A Reader* (Berkeley: University of California Press, 1979), p. 106; hereafter cited in the text as *PHC*. Ricoeur also bypasses Heidegger's concern for Being. Grounded as his thinking is in the French tradition of reflexive philosophy, Ricoeur's guiding question is not so much 'What is the meaning of being?' as 'Who am I?' He writes: 'L'herméneutique devenait pour moi le long détour d'une philosophie de la réflexion, la médiation interminable de l'auto-compréhension…[M]a philosophie s'est développée—grossièrement parlant—comme une anthropologie philosophique, où la question de l'être se réduit à celle du mode d'être de cet être capable de se désigner comme sujet parlant, comme agent et patient de l'action, comme sujet moral et politique, porteur de responsabilité et de citoyenneté' ('Réponses' in *'Temps et récit' de Paul Ricoeur* (note 12), p. 211).

27 Bernstein [9.29], 159.

28 I owe this particular observation to Paul Fairfield.

29 The parallel between the two was one of the principal objects of concern of Merleau-Ponty's hermeneutical phenomenology.

30 What Gadamer says here of historical understanding could be applied, *mutatis mutandis,* to intercultural or ethnological understanding and could be usefully contrasted with the position defended by Peter Winch.

31 For a good overview and discussion of the issues involved in this debate, see Bernstein [9.29].

32 It would not be desirable, in that it is incompatible with the philosophical-political values to which hermeneutics subscribes—a topic to be considered later in this chapter.

33 Gadamer, 'The Science of the Life-World', *Analecta Husserliana,* 2 (1977): 185. It should be noted that this text differs from the version published subsequently under the same title in *Philosophical Hermeneutics*.

34 Ricoeur makes a similar remark: 'The truth is…the lighted place in which it is possible to continue to live and to think. And to think *with* our very opponents themselves, without allowing the totality which constrains us ever to become a knowledge about which we can overestimate ourselves and become arrogant' ('Reply to My Friends and Critics' [9.25], no page no.). It could thus be said that for hermeneutics 'truth' is primarily not 'cognitive' but a 'moral' concept; it refers not so much to bits and pieces of 'information' we may *possess* as it does to a general mode of *living* (being-in-the-world). In this connection Ricoeur remarks, in a very Jamesian sort of way: 'We wager on a certain set of values and then try to be consistent with them; verification is therefore a question of our whole life. No one can escape this…. I do not see how we can say that our values are better than all others except that by risking our whole life on them we expect to achieve a better life, to see and to understand things better than others' (*Lectures on Ideology and Utopia* [9.16], 312).

35 In *La symbolique du mal* (*Philosophie de la volonté: Finitude et culpabilité,* vol. II) (Paris: Aubier, 1960). English translation: *The Symbolism of Evil* [9.20].
36 D.C.Hoy [9.33], 61.
37 See T.M.Van Leeuwen [9.28] 1.
38 Ricoeur, *The Conflict of Interpretations* [9.13], 411.
39 In what is said, there is always, Gadamer insists, 'an infinity of what is not said' ([9.7], 426).
40 This point is developed by Sartre in *La transcendance de l'ego: Esquisse d'une description phénoménologique* (Paris: J.Vrin, 1966).
41 Merleau-Ponty, *Phenomenology of Perception* (note 21): there is no inner man, man is in the world, and only in the world does he know himself' (p. xi).
42 It should perhaps be noted that, from a Gadamerian point of view, conversation is not so much an *instance* of language as it is what language essentially *is*.
43 As Gadamer goes on to point out: 'Where a person is concerned with the other as individuality, e.g. in a therapeutical conversation or the examination of a man accused of a crime, this is not really a situation in which two people are trying to understand one another.' (In a footnote Gadamer remarks that in such a situation the questions which arise are 'marked by insincerity'.) As we shall see later, this view of conversation has important consequences for the theory of text-interpretation.
44 For a discussion of these issues see Ricoeur, 'Structure, Word, Event' in *The Conflict of Interpretations* [9.13].
45 Ricoeur, 'New Developments in Phenomenology in France: The Phenomenology of Language', trans. P.Goodman, *Social Research,* 34:1 (spring 1967): 14.
46 See J.Habermas, *The Philosophical Discourse of Modernity,* trans. F.Lawrence (Cambridge, Mass.: MIT Press, 1987), pp. 41–2.
47 Gadamer, 'Practical Philosophy as a Model of the Human Sciences', *Research in Phenomenology,* 9 (1980):83.
48 See Gadamer, 'Reply to My Critics' in G.L.Ormiston and A.D.Schrift, *The Hermeneutic Tradition: From Ast to Ricoeur* (Albany: State University of New York Press, 1990), pp. 275–6.
49 For Hirsch, in contrast, meaning is always *willed* meaning (see *Validity* (note 9), p. 51).
50 See also pp. xix, 321, 336, 338, 353, 356.
51 This point is developed in aesthetic response theory and reader reception theory by Wolfgang Iser and Hans Robert Jauss, respectively (see Iser, *The Act of Reading: A Theory of Aesthetic Response* (Baltimore: Johns Hopkins University Press, 1978) and Jauss, *Towards an Aesthetic of Reception,* trans. T.Bahti (Minneapolis: University of Minnesota Press, 1982). Ricoeur discusses the views of Iser and Jauss in *Time and Narrative* [9.21], vol. 3, pp. 166ff.
52 Bernstein [9.29], 145.
53 G.W.F.Hegel, *The Philosophy of History* (New York: Dover Publications, 1978), p. 106.
54 Gadamer, 'The Power of Reason', *Man and World,* 3:1 (1970):15. In response to Habermas's charge that 'tradition', as hermeneutics understands it, is not subject to a critique guided by an 'emancipatory interest', Gadamer makes the following counter-charge: 'unconsciously the ultimate guiding image of emancipatory reflection in the social sciences [i.e., Habermas's position] must be an anarchistic utopia. Such an image, however, seems to me to reflect a hermeneutically false consciousness, the antitode for which can only be a more universal hermeneutical reflection' ([9.5], 42).
Gadamer's emphasis on tradition is not meant to deny either (1) the universality of certain

values or (2) the critical function of *reason*. What it does deny is the existence of an *ahistorical* reason (the kind of 'transcendental' reason appealed to by Habermas that can escape tradition altogether). In *Truth and Method* Gadamer states his position in the following way: 'Does the fact that one is set within various traditions mean really and primarily that one is subject to prejudices and limited in one's freedom? Is not, rather, all human experience, even the freest, limited and qualified in various ways? If this is true, then the idea of an absolute reason is impossible for historical humanity. Reason exists for us only in concrete, historical terms, i.e., it is not its own master, but remains constantly dependent on the given circumstances in which it operates' ([9.7], 245).

We shall return to the question of values and rational critique in the concluding section of this chapter.

55 Gadamer, 'Reply to My Critics' (note 48), p. 273.

56 Gadamer, 'Hermeneutics as Practical Philosophy', in *Reason in the Age of Science* [9.6], 111.

57 For a detailed treatment of this issue see my 'The New Philosophy of Rhetoric', *Texte: Revue de critique et de théorie littéraire,* 8/9 (1989):247–77.

58 See C.Perelman and L.Olbrechts-Tyteca, *Traité de l'argumentation: la nouvelle rhétorique* (Bruxelles: Editions de l'Institut de Sociologie, Université Libre de Bruxelles, 2nd edn, 1970).

59 R.Bernstein remarks in this regard: 'Although the concept of truth is basic to Gadamer's entire project of philosophic hermeneutics, it turns out to be one of the most elusive concepts in his work' ([9.29], 151).

60 Ricoeur, 'Langage (Philosophie)' *Encyclopaedia Universalis,* vol. 9 (1971), p. 780.

61 See Ricoeur, 'The Model of the Text' in *Hermeneutics and the Human Sciences* [9.15], 212–13.

62 See also pp. 146–7, 203. Ricoeur also says that whereas Gadamer, with his reliance on the model of conversation, places a great deal of confidence in *Einverständnis*—profound agreement—he himself is 'beaucoup plus sensible au caractère conflictuel du champ d'interprétation' ('De la volonté à l'acte' in *'Temps et récit' de Paul Ricoeur* (note 12), p. 19.

63 'Distantiation is not the product of methodology and hence something superfluous and parasitical; rather it is constitutive of the phenomenon of the text as writing' ([9.15] 139). Critics of Ricoeur might argue that his own critique of Gadamer is not entirely fair, in that Gadamer himself argues for a 'positive' notion of distantiation. See, *inter alia,* the following remarks that Gadamer made in his lectures at the University of Louvain in 1957: 'Contrary to what we often imagine, time is not a chasm which we could bridge over in order to recover the past: in reality, it is the ground which supports the arrival of the past and where the present takes its roots. "Temporal distance" is not a distance in the sense of a distance to be overcome…. Actually, it is rather a matter of considering "temporal distance" as a fundament of positive and productive possibilities for understanding' (*PHC,* 155–6).

If it is the case that Ricoeur has misread Gadamer on this score, then it is also the case that he concedes too much to Habermas in the latter's criticism of Gadamer (for Ricoeur's attempt to mediate the dispute between Habermas and Gadamer, see 'Hermeneutics and the Critique of Ideology' in *Hermeneutics and the Human Sciences*) [9.15]. If Ricoeur argues for a positive notion of distantiation, it is because he wants to maintain (against Habermas) that hermeneutics has to do not only with the transmission of the past (as Habermas portrays Gadamer as saying) but that it can also incorporate a *critical* moment in the appropriation process. However, if Gadamer's notion of distantiation is itself of a positive sort, then there

is *already* a critical element in Gadamer's hermeneutics (which therefore does not need to be supplemented with borrowings from Habermas's critical theory). As I have already indicated, Gadamer does indeed make this claim.

64 The 'second order referentiality' of metaphorical discourse was one of the main things that Ricoeur sought to demonstrate in *La métaphore vive* (Paris: Seuil, 1975); English trans.: *The Rule of Metaphor* [9.19].

65 This highlights an important difference between Ricoeur's theory of text-interpretation and other postmodern theories which indeed do legitimate 'projecting oneself into the text' in whatever way, i.e., engaging in 'strong misreadings' of the text. An outstanding example of just how 'strong' misreadings of a deconstructionist sort may be is provided by the American literary critic J. Hillis Miller. In a review of Ricoeur's *Time and Narrative,* Miller asserts that 'hermeneutic theories', such as Ricoeur's, assume 'the existence of stable monological texts of determinable meanings, meanings controlled in each case by the intentions of the author and by the text's reference to a pre-linguistic "real world out there"'. One's astonishment over such a manifestly absurd remark (do deconstructionists even bother any more to read the texts they pretend to 'interpret'?) is compounded when a few paragraphs further on one reads: 'his view of language remains a more or less unambiguous copy theory. Language, for him, mirrors, represents or "expresses" the lived world' ('But Are Things as We Say They Are?', *Times Literary Supplement,* 9–15 October 1987:1104).

66 See in this regard 'On Interpretation' (see note 7), pp. 185ff. The subject of the 'self' was the topic of Ricoeur's 1986 Gifford Lectures, 'On Selfhood, The Question of Personal Identity', published in book form under the title *Soimême comme un autre* (Paris: Seuil, 1990), trans.: *Oneself as Another* [9.17].

67 'Si le sens n'est pas un segment de la compréhension de soi, je ne sais pas ce que c'est' (*Esprit,* November 1983:636).

68 S.B.Messer, L.A.Sass, R.L.Woolfolk (eds), *Hermeneutics and Psychological Theory: Interpretive Perspectives on Personality, Psychotherapy, and Psychopathology* (New Brunswick: Rutgers University Press, 1988), p. xiii.

69 C.Geertz, *The Interpretation of Cultures* (New York: Basic Books, 1973), p. 5.

70 By way of underscoring the purposive nature of human action, Mises writes: 'There is no human being to whom the intent is foreign to substitute by appropriate conduct one state of affairs for another state of affairs that would prevail if he did not interfere' (*The Ultimate Foundation of Economic Science: An Essay on Method* (Kansas City: Sheed Andres & McMeel, 1978), p. 71).

71 That various social orders are the result of human action but not necessarily of human design has been one of the major themes in the work of F.A. Hayek whose work anticipates, in many ways, that of Gadamer and Ricoeur. See in this regard my 'Hayek and the Interpretive Turn', *Critical Review,* 3:2 (spring 1989).

72 C.Taylor, 'Interpretation and the Sciences of Man', in P.Rabinow and W. M.Sullivan (eds), *Interpretive Social Science: A Reader* (note 26), p. 48.

73 See Ricoeur, 'History as Narrative and Practice', interview with P.Kemp, *Philosophy Today* (fall 1985):216.

74 J.Wakefield, 'Hermeneutics and Empiricism: Commentary on Donald Meichenbaum' in Messer *et al.* (eds), *Hermeneutics and Psychological Theory* (note 68), p. 143.

75 Geertz, *The Interpretation of Cultures* (note 69), p. 9.

76 The interpretive economist D.Lavoie remarks in this regard: 'The fact that the objects of our study *already have* an interpretation of what is going on does not release the social scientist

from the responsibility to develop and defend her own explication of what is going on. The interpreter should not try to rid herself of her own perspective in order to 'adopt' that of the interpreted, but must try to find new ways to use her presuppositions to attain a better understanding of the human activities under study…. Thus interpretation always means *adding* to what is said through a mediation of the 'horizons' of the interpreter and the interpreted' ('The Account of Interpretations and the Interpretation of Accounts: The Communicative Function of "The Language of Business"', *Accounting, Organizations and Society,* 12:6 (1987):594).

77 J.B.Thompson, *Ideology and Modern Culture: Critical Social Theory in the Era of Mass Communication* (Stanford: Stanford University Press, 1990), p. 323. In his analysis of ideology Thompson draws extensively on suggestions put forward by Ricoeur. For a comparative study of Ricoeur's hermeneutics and the critical theory of Jürgen Habermas, see his earlier work [9.26].

78 See Gadamer's discussion of Dilthey in 'The Problem of Historical Consciousness' (note 26).

79 Jean Grondin, 'L'herméneutique positive de Paul Ricoeur' in *'Temps et récit' de Paul Ricoeur* (note 12), p. 125.

80 Geertz, *The Interpretation of Cultures* (note 69), p. 30.

81 In *Time and Narrative* [9.21], vol. I, Ricoeur refers to 'explanation' and 'understanding' as 'a now obsolete vocabulary'; he prefers to speak instead of 'nomological explanation and explanation by emplotment' (p. 181).

82 Of Ricoeur's work in this area historian H.White has said: 'Ricoeur's is surely the strongest claim for the adequacy of narrative to the realization of the aims of historical studies made by any recent theorist of historiography' ('The Question of Narrative in Contemporary Historical Theory', *History and Theory,* 1 (1984):30).

For a discussion of Ricoeur's treatment of the imagination over the course of his writings see Richard Kearney, 'Paul Ricoeur and the Hermeneutic Imagination', in T.P.Kemp and D.Rasmussen (eds) [9.24] (reprinted in Kearney, *Poetics of Imaging: From Husserl to Lyotard* (London: Harper Collins Academic, 1991)). The thesis defended by Kearney is that 'a poetic hermeneutic of imagination' represents 'the ultimate, if discreet, agenda of his philosophical project' (p. 2). The following remark of Ricoeur lends support to this thesis: 'Despite appearances the one problem that has interested me from the beginning of my work as a philosopher is that of creativity. I worked from the angle of individual psychology in my early work on the will, then on the cultural level with my studies on symbolisms. My present work on narrative puts me right at the heart of this social, cultural, creativity' ('History as Narrative and Practice', *Philosophy Today* (fall 1985):222).

83 Thus, for example, economist D.Lavoie writes, with reference to Ricoeur: 'History is in this view not an attempt to find quantitative covering laws that fully determine a sequence of events, but an attempt to supply a qualitative interpretation of some part of mankind's "story". The whole purpose of the theoretical social sciences (including economics and accounting research) is to equip people with the capacity to better distinguish acceptable from unacceptable historical narratives…. What we find ourselves doing in the social sciences is not so much the testing of *ex ante* predictions but is more of the nature of what the Austrian economist F.A.Hayek calls an *ex post* explanation of principles. The only "test" any theory can receive is in the form of a qualitative judgment of the plausibility of the sequence of events that has been strung together by narrative' ('The Account of Interpretations and the Interpretation of Accounts' (note 76), pp. 595–6).

84 D.Pellauer, 'The Significance of the Text in Paul Ricoeur's Hermeneutical Theory' in

[9.25], 112, 109.

85 Ricoeur's interest in history and narrative can be seen to be the logical outgrowth of his abiding concern over the issue of human action, since, in being 'fixated', action is transformed into institutionalized social patterns, which is to say that it generates historical processes.

86 Ricoeur deals at length with the issue of the 'social imagination' (of which ideology and Utopia are two basic modes) in *Lectures on Ideology and Utopia* [9.16].

87 See Ricoeur's remarks on violence and discourse in *Main Trends in Philosophy* (New York: Holmes & Meier, 1979), pp. 224–7. On p. 227 Ricoeur writes: 'It is because we, as men, have chosen discourse—that is, discussion, seeking agreement by means of verbal confrontation—that the defence of violence for violence's sake is forever forbidden us.'

88 'Reaching an understanding in conversation presupposes that both partners are ready for it and are trying to recognize the full value of what is alien and opposed to them' ([9.7], 348).

89 Speaking of the humanistic ideal of the German historical school, Gadamer says that it 'does not contain any particular content, but is based on the formal ideal of the greatest variety. This kind of ideal is truly universal, for it cannot be shaken by any historical evidence, any disturbing evidence of the transience of human things. History has a meaning in itself' ([9.7], 178).

The political motivation for Ricoeur's defence of philosophical humanism is evident in the following remark: 'If anti-humanism is true, there is also no theoretical basis on which the legal subject can oppose the abuse of political authority' (*Main Trends in Philosophy,* p. 369).

90 The real 'ethnocentrist', hermeneutics maintains, is the person who denies the universal validity ('applicability') of the principles of freedom and reason and who asserts that any criticism of non-western societies for failing to recognize these principles is an instance of 'Eurocentrism'. As a leading spokesperson for democratic values ('such basic ideas as representative government, human rights, and the rule of law') in the 'third world', Aung San Suu Kyi, recipient in 1991 of the Nobel Peace Prize, has stated: 'The proposition that the Burmese are not fit to enjoy as many rights and privileges as the citizens of democratic countries is insulting' ('In Quest of Democracy', *Journal of Democracy,* 2:1 (January 1992):6 and 11). Anti-universalist ethnocentrism ('reverse Eurocentrism') is indeed an affront to basic human dignity.

91 Bernstein [9.29], p. 163.

92 S.Rosen, *Hermeneutics as Politics* (New York: Oxford University Press, 1987), p. 141.

93 Gadamer, 'The Power of Reason', *Man and World,* 3:1 (1970):8.

94 Ricoeur, *Main Trends in Philosophy* (note 87), p. 315.

95 In 'Hermeneutics and Social Science', *Cultural Hermeneutics,* 55 (1970), Gadamer writes: 'the chief task of philosophy is…to defend practical and political reason against the domination of technology based on science. That is the point of philosophical hermeneutic' (p. 316).

96 'The Power of Reason' (note 93), p. 13.

97 See in this regard Gadamer's remarks on natural law in *Truth and Method* [9.7].

98 Cf. Gadamer, 'The Power of Reason' (note 93): 'Clearly reason has an immediate connection with the universal' (p. 6); 'identification with the Universal—what is Reason if not that?' (p. 12). Reason is 'the self-realizing identification with the universal' (p. 14). On p. 13 of this text Gadamer identifies 'loss of freedom' with 'lack of possibility of identifying with the universal'.

99 See Gadamer. 'Reply to My Critics' (note 48), p. 289.

100 I.Kant, 'Ideas for a Universal History from a Cosmopolitan Point of View', in *On History,* L.W.Beck (ed.) (Indianapolis: Bobbs-Merrill, 1963), p. 16. Kant goes on to characterize such a society as 'the society with the greatest freedom. Such a society is one in which there is a mutual opposition among the members, together with the most exact definition of freedom and fixing of its limits so that it may be consistent with the freedom of others'.

101 The notion of human rights, as hermeneutics conceives of it, is not a metaphysical notion and does not appeal to essentialist or foundationalist modes of thinking. Human rights are not 'natural rights' (as Gadamer's critic, L.Strauss, would maintain); they are *rational rights, rights of reason*. That is to say, they are injunctions as to how people *ought* to be treated, given what they in fact *are,* namely rational beings. That means: beings who have the *logos* (as Isocrates said), i.e., are capable of engaging in dialogical or communicative rationality. Basic rights such as freedom of speech, of conscience, of association, and so on, are simply enumerations of the legal-institutional guarantees that are required for the unimpeded exercise of this form of rationality. Since, as Gadamer recognizes, the 'power of reason' is not a 'natural faculty' but a social attribute ('This is not simply a capacity that man has, but something of the sort that must be developed' ('The Power of Reason' (note 93), p. 7), people can be fully rational (and thus fully human) only when they have the good fortune of living within the kind of institutional set-up that these rights make possible. Human rights are what those rational beings who are reflectively aware of what they are will claim for themselves, in order to be recognized for what they are and in order to become what they are (cf. Tiananmen Square, 1989).

102 'The Power of Reason' (note 93), p. 8.

109 See Ricoeur, *Main Trends in Philosophy* (note 87), p. 372. On another occasion, Ricoeur says that 'the lament of modern philosophy [is] that we have to raise Hegelian problems without the Hegelian solutions.' While rejecting the notion of absolute knowledge and all-encompassing theories of history, he nevertheless concedes: 'Maybe we cannot have passionate history without a certain expectation of what *could be* the global meaning of history, but that must remain at the level, I think, of hypothesis; that must remain a kind of working hypothesis' ('The Conflict of Interpretations' in R.Bruzina and B.Wilshire (eds), *Phenomenology: Dialogues and Bridges* (Albany: State University of New York Press, 1982), pp. 319–20).

CHAPTER 10
Italian idealism and after

Gentile, Croce and others

Giacomo Rinaldi

INTRODUCTION

The history of twentieth-century Italian philosophy is strongly influenced both by the peculiar character of its evolution in the preceding century and by widespread tendencies of contemporary continental (especially German) thought. In nineteenth-century Italian philosophy we can distinguish four main trends: (1) St Augustine's and Aquinas's traditional *dualistic metaphysics,* which was renewed with some originality by the priest Antonio Rosmini Serbati (1797–1855), and was regarded by the Roman Catholic church as its 'official' philosophical doctrine; (2) *methodological empiricism,* which was developed since the Renaissance especially by the founder of modern mathematical physics, Galileo Galilei, and which found its most prominent exponent in the *positivist* thinker Roberto Ardigò (1828–1920); (3) the speculative German tradition of *Kantian-Hegelian idealism,* according to its interpretation as a *metafisica della mente,* i.e. as a philosophy of pure self-consciousness, outlined by the greatest nineteenth-century Italian thinker, Bertrando Spaventa (1817–83); and finally (4) Marx's and Engels's *historical materialism,* which was spread and fostered especially by Antonio Labriola (1843–1904), who worked out a 'humanistic' (anti-naturalistic) interpretation of it.

The influence of 'classical German philosophy' from Kant to Marx on twentieth-century Italian thought thus turns out to be strictly determined and 'mediated' by the peculiar character of its interpretation and appropriation in the preceding century. But other trends of German thought too are studied, interpreted and further developed by contemporary Italian philosophers, thus exerting a direct, 'immediate' influence on them: e.g., the German tradition of 'speculative mysticism' (one might recall the philosophies of the later Fichte and the later Schelling, as well as Gadamer's 'hermeneutics'), the 'philosophy of immanence' (Schuppe and Schubert-Soldern), the 'empiriocriticism' of Mach and Avenarius; Husserl's 'phenomenology' and Heidegger's 'existentialism', etc.

The peculiar political-cultural context in which the above-mentioned trends of contemporary Italian thought arise and spread can be sketched as follows. The philosophy of German idealism, and especially its Hegelian version, owing both to its origin in Protestant theology and religiosity and to its insistence on the state's 'ethical' essence as the supreme moral law of the individual's practical activity, met the spiritual exigencies of those 'liberal-national' movements of the Italian *Risorgimento* which aimed at the foundation of a unitary state, and which saw their major adversary in the Catholic church's temporal power.[1] Augustine's and Aquinas's dualistic metaphysics, on the

contrary, prevailed in the most conservative classes and political trends in Italian society, and can be safely regarded, as it were, as the Roman Catholic church's secular arm in its intellectual and moral life. At the extreme opposite of the social-political array, Marx's historical materialism seemed able to offer an 'objective', 'scientific' foundation to the political aspirations of those who dreamt of radically transforming Italian society's traditional order, be it the more archaic one sanctioned by the Roman Catholic church or the more recent one of the national unitary state. Finally, positivistic empiricism became, as it were, the 'official' ideology of the rising Italian industrial bourgeoisie, concentrated especially in the country's northern regions.

One can easily distinguish three fundamental evolutionary phases in twentieth-century Italian philosophy. In the first (*c.* 1900–45) we witness an indisputable prevalence of the idealistic trends, among them especially Giovanni Gentile's thought. This is despite the often exaggerated cultural influence of his 'actual idealism', which from its first 'official' statement (1911) was strongly opposed by other no less famous representatives of Italian idealism such as Pietro Martinetti, Benedetto Croce and Pantaleo Carabellese. In the second phase (*c.* 1945–80), a widespread violent reaction against idealistic philosophy in general, and 'actual idealism' in particular, occurred. Antonio Banfi, Nicola Abbagnano, etc. set against it not only the materialistic conception of history, but also later tendencies of German thought such as, e.g., Husserl's phenomenology and Heidegger's existentialism. The distinction between the first and the second phase, however, must be understood not simply as a rigid separation, but as indicating a *prevalence* of the idealistic orientation in the first half of the twentieth century and of the anti-idealistic one in the second. In effect, the influence of nineteenth-century positivism does not disappear in the age dominatedby Croce's and Gentile's thought (it suffices to think, in this regard, of the writings of sociologists such as Vilfredo Pareto (1868–1923), of economists such as Luigi Einaudi (1874–1961), and of methodologists of science such as Antonio Aliotta (1881–1964). Furthermore, many of the most prominent exponents of the reaction against idealism in the second half of the century (e.g., Antonio Gramsci, Abbagnano and Banfi) had already worked out their fundamental conceptions before 1945. On the other hand, although in weakened and often speculatively unfruitful forms, the philosophical traditions of Gentile's 'actual idealism' and of Croce's 'absolute historicism' have survived up to today.[2] In the 1980s, the final phase, something like a widespread 'decline of ideology' ('tramonto dell'ideologia') has, as Lucio Colletti says, taken place. The most remarkable consequence of it is likely to be the perhaps definitive dissolution of the cultural influence of the materialistic conception of history, which in the second half of the century has often represented one of the most powerful and unrelenting adversaries of any idealistic speculation. Although, then, the current situation of the 'spirit' of Italian culture is undoubtedly pervaded with a general feeling of bewilderment and creative impotence, yet it might also disclose new horizons and real possibilities for a critical resumption and further original development of the most glorious and speculatively fruitful trend in Italian thought—i.e., the Kantian-Hegelian tradition.

'ACTUAL IDEALISM': GIOVANNI GENTILE

Giovanni Gentile (1875–1944), who was rightly defined by Michele Federico Sciacca as 'the greatest Italian philosopher in our century',[3] was the author of numerous philosophical and historiographical works which are to be counted among the masterpieces of Italian thought in any age and have left an indelible trace also on the development of contemporary European philosophy. Here I can confine myself to mentioning the most relevant ones: *La riforma della dialettica hegeliana (The Reform of Hegelian Dialectic)* (1913 [10.32]), *Sommario di pedagogia come scienza filosofica (An Outline of Pedagogy as a Philosophical Science),* two volumes (1913–14 [10.33]), *Teoria generate dello spirito come atto puro (General Theory of Mind as Pure Act)* (1916 [10.35]), *I fondamenti della filosofia del diritto (The Foundations of the Philosophy of Law)* (1916 [10.34]), *Sistema di logica come teoria del conoscere (A System of Logic as a Theory of Knowledge),* two volumes (1917–22 [10.36]), *Le origini della filosofia contemporanea in Italia (The Origins of Contemporary Philosophy in Italy),* three volumes (1917–23 [10.37]), *Discorsi di religions (Speeches on Religion)* (1920 [10.38]), *La filosofia dell'arte (The Philosophy of Art)* (1931 [10.42]), *Introduzione alla filo-sofia (An Introduction to Philosophy)* (1933 [10.43]), and finally his posthumously published book *Genesi e struttura della società (Genesis and Structure of Society)* (1946 [10.44]). Gentile's works organically merge a vigorous theoretical development of his own original philosophical doctrine, 'actual idealism' (or 'actualism') with an immense, philologically very accurate, historiographical erudition, focusing especially upon the history of Italian philosophy and culture.

The doctrine of 'actual idealism' can be safely regarded as an attempt to press to its extreme consequences Spaventa's interpretation of Hegelian philosophy as a metaphysics of pure self-consciousness. Philosophy is the search for truth—not for this or that particular 'abstract' truth, but for the unique 'absolute' truth (and reality). And such a truth cannot possibly 'transcend' thought's self-conscious act which aspires to its possession. For in such a case not only could the latter never be 'certain' of any truth whatsoever, but as essentially 'other' than (absolute) truth it could not but turn into a mere contingent phenomenon. This, however, is clearly disproved by the fact that, as Descartes had already pointed out, one can deny the 'evidence' of self-conscious thought only by virtue of a further, more original act of thinking. Gentile can therefore assert: 'cogito ergo sum; sum substantia cogitans; quatenus substantia in me sum et per me concipior; hoc est mei conceptus non indiget conceptum alterius rei, a quo formari debeat' ('I think, therefore I am. I am a thinking substance. As a substance I am in myself and can be thought of only through myself—i.e., the concept of myself need not any concept of another thing in order to be thought of').[4] Yet according to Gentile, unlike Descartes, not only is consciousness actual but the whole of reality turns into consciousness. For any possible objectivity, in the final analysis, turns out to be *absolutely* enclosed in it, as its own immanent content, or rather 'opposite'. Since the act of consciousness is *one* and 'unmultiplicable' *(immoltiplicabile),*[5] the object's essence, then, will be radically *manifold*. On the other hand, as the object is but a *negative* content of knowing, that of which consciousness can be *actually* aware is only *itself*. As Hegel had already maintained, the 'truth' of consciousness is therefore *self-consciousness*. 'The Ego's act is consciousness as self-consciousness; the Ego's object is the Ego itself. Any conscious process is an act of self-consciousness.'[6] In such an act, then, subject and

object *coincide*. But their identity is never 'immediate'. For self-consciousness is every truth *only* as the *necessary* consciousness of the *error* that essentially inheres to any 'immediate' (i.e. sensuous, manifold, natural, etc.) being as such. As a consequence, its 'being' can become actual only as the negation of a 'not-being' originally immanent to it—and thus is a *dialectical unity of opposites*. Now, as Hegel himself had shown by 'deducing' Becoming from the opposite 'abstractness' of Being and Nothing, such a unity can be consistently conceived only as 'movement' or 'process': 'The subject that resolves the object into itself, at least when this object is a spiritual reality, is neither a being nor a state of being: it is nothing immediate, as we said, but a constructing process—a process constructing the object as a process constructing the very subject.'[7]

One of the deepest and most fascinating aspects of 'actual idealism' is certainly Gentile's insightful distinction between his 'transcendental' concept of the self-conscious Ego and the 'empirical Ego' (the sensuous-finite individual), and consequently between the former's peculiar processuality and the form of 'time'. In fact, both the empirical Egos and time (which to Gentile, unlike Kant, is, like 'space', the essential form of *nature, not* of consciousness) imply a *plurality* of 'facts', or 'points', which exclude each other, either in the simultaneity of spatial existence or in the succession of temporal becoming. The transcendental Ego, on the contrary, as *necessarily* existing *(cogito ergo sum),* is of necessity *universal,* and thus *unique*. The mutual transcendence (exclusion) of the empirical Egos as well as of the moments of sensuous time (past, present and future), therefore, is in the final analysis negated (in the Hegelian sense of 'negation', i.e. as *Aufhebung*) in the *timeless,* 'eternal' process of the transcendental Ego—of the *pensiero pensante*. 'Thought as actual, or as the universal Ego, contains, and therefore overcomes not only the spatiality of pure *nature,* but also the temporality of pure natural becoming. Thought is beyond time, is eternal.'[8] 'And therefore the moment *[istante],* the ἐξαίφνης of thought, is not a moment among the moments, is not in time; it has no 'before', and no 'after'; it is eternal.'[9]

Gentile deduces with admirable logical cogency the overall articulation of spirit's whole life from his concept of human self-consciousness as 'mediate', dynamic unity of subject and object. If their unity cannot in principle be 'immediate', this means that they are immediately different, and even opposite. Pure ('abstract') subject, pure ('abstract') object, and their ('concrete') mediation (identity of subject and object)—these are the three fundamental 'phases' of self-conscious thought's process, the three 'absolute forms of spirit'.[10] The form of spirit's abstract subjectivity coincides, according to Gentile, with 'pure feeling' *(sentimento puro),* which constitutes the specific element of *art*.[11] It is not to be mistaken for the *psychological* sensations of pleasure and pain, although these latter do constitute the opposite 'poles' of its immanent dialectic, for it is not conditioned by any alleged extramental reality,[12] and thus is 'infinite'. Although acknowledging that feeling, art, beauty, etc. *are* the origin, and even the 'root' *(radice),* of spirit's whole development, Gentile emphatically denies that they constitute something more than a merely 'abstract', 'inactual' moment of it. For in the act of thinking in which they are thought of as such, they necessarily negate themselves as 'pure' feeling, 'pure' beauty, etc., and rather identify themselves with the very (concrete) objectivity of pure thought. In fact, Gentile says, '[k]nowing is identifying, overcoming otherness as such'.[13] The very moment, then, the self-conscious subject becomes fully aware of the

'intimacy' *(intimità)* of its feelings, it cannot but objectify them, and thus transform them into a thought-content. Not unlike Hegel, Gentile therefore denies any possible *autonomous* development of art.[14]

The pure, 'abstract' object, we have seen, is the immanent negation of the act of thinking. Gentile can therefore proceed to set spirit's unity, universality, necessity, activity, freedom, eternity, etc. over against the radical multiplicity, particularity, contingency, passivity, temporality, etc. of *nature,* which is just the object of thought as 'immediately' other than it. He consequently holds to a rigidly *deterministic* and *mechanical* conception of nature. For him this *is* immanent to spirit, but the latter is not immanent at all to it *as such*. To the extent that nature's reality is (abstractly, and therefore 'erroneously') posited, the actuality of the spiritual subject must be negated. This is also the case with the positive (both 'natural' and 'historico-social') sciences, since they describe or explain an essentially manifold object (the 'phenomenal' plurality of natural 'facts' or of historical 'events'), and, moreover, abstract from its essential relation to the self-conscious act of thinking as its ultimate origin and condition of possibility. Yet no less abstractly objective, and therefore in the final analysis negative and 'erroneous', than sensible nature and the positive sciences is the *intelligible* multiplicity of the concepts, principles, and logical laws that constitute the subject matter of traditional formal logic. Although the first volume of his *Sistema di logica come teoria del conoscere (A System of Logic as a Theory of Knowing)* is devoted to a close examination of its fundamental structures,[15] such a logic, whose peculiar object he defines in terms of *logo astratto* (abstract thought) or of *pensiero pensato* (thought thought of), is radically unable adequately to express the logical essence of thought's *self-conscious* process (or *autoconcetto*). Just as was the case with nature and the positive sciences, Gentile does recognize the necessity of the *logo astratto* but for no other reason than that in his *dialectical* conception of spirit's becoming the negative, the 'abstract' is no less essential than the positive, the 'concrete', to its 'self-positing' *(autoctisi)*.

As an 'abstractly' objective form of spirit Gentile does not hesitate to consider religion itself, both as confessional religiosity[16] and as subjective mystical experience. This is because religion generally sets against pure self-consciousness, as the creating principle of its being, an absolutely transcendent personal God, who, as such, is obviously an 'other' with respect to its 'pure immanence', and thus an 'inactual' abstraction. On the other hand, in mystical experience the subject does try to identify itself with the objectivity of the 'divine', but at the cost of *annihilating* itself as consciousness, and, a fortiori, as *self-consciousness*.[17] Not unlike spirit's artistic form, then, to Gentile religion too remains incurably 'abstract'. The 'concrete' unity of subject and object, therefore, can be attained only by a higher spiritual form, in which the object is conceived as essentially immanent to the subject, and this latter not as merely 'subjective' feeling but as the 'substantial', 'objective' subjectivity of *actual thought*. And this, of course, can be explicated only by *philosophy,* which for Gentile coincides without residue with spirit's *ethico-political* activity. For it is possible to distinguish them only by somehow opposing thought to action, theory to praxis, or, within the latter, the 'morality' of the individual to the 'ethicality' of society (or of the state). Yet for him the very intrinsic absoluteness, creativity and actuality of the *autoconcetto* excludes in principle the possibility that it may be conceived as *mere* theory, as a *passive* 'reflection' of a 'given' it does not itself

'posit'. As a consequence, it does not lack that creative energy which traditional philosophy (before and after him) is rather inclined to ascribe to the will alone. On the other hand, to Gentile the only concrete effective moral life the human individual can realize is that which unfolds in the organic, 'spiritual' unity of *social* institutions, from the family up to the state.[18] The very moment, then, speculative philosophy theoretically 'constructs' absolute truth in the 'pure act' of self-consciousness, it also actualizes itself in those ethico-political institutions which are the 'kernel', as it were, of humanity's spiritual history.

Despite the extremely summary character of this outline of Gentile's idealism I believe that the reader can easily grasp its fundamental difference from Hegel's, whose paternity, on the other hand (through the mediation of Spaventa's interpretation), he openly recognizes. Whereas to Hegel there exists a dialectical movement of the logical categories and of natural reality which is *not yet,* as such, (explicitly) *self-conscious,* to Gentile the only possible dialectical process, and then concrete actuality, is that of self-conscious spirit. Whereas to Hegel an organic, ideological development of the *Denken,* of speculative reason, is immanent in nature (despite its being nothing more than the Absolute Idea's self-alienation), to Gentile (not unlike, at least in this regard, Kant and the positivists old and new) it is nothing more than a dead mechanism determined by merely quantitative and causal connections. Whereas to Hegel the identity of knowing and the will in the Absolute Idea does not exclude a no less substantial 'logical' difference between them, which, in the Philosophy of Spirit, renders possible the further distinction between the 'finite' sphere of ethico-political life ('objective' Spirit) and the higher one of the artistic, religious and philosophical contemplation of the Absolute (Absolute Spirit), to Gentile there is no other 'Absolute' than spirit's ethico-political history, nor any other 'spirit' than the 'infinite' unity of the 'Ego=Ego' (i.e., Absolute Spirit).

To these fundamental differences two others can be added, which seem to me no less relevant, although strictly logico-methodological in character. First of all, Hegelian dialectic unfolds in a succession of categories (*Denkbestimmungen* and *Begriffsbestimmungen*) in which the preceding are (relatively) more 'abstract' than the subsequent ones, while the latter are (relatively) more 'concrete', and constitute the 'truth' of the former, which are both 'negated' and 'preserved' *(aufgehoben)* in them. To Gentile, on the contrary, the 'concrete', the 'Ego=Ego' is the beginning of the dialectical process not only in the *ontological* order of reality and truth, but also in the *methodological* one of its dialectical explication. Second, while to Hegel the speculative synthesis of opposites constitutes itself as a *Stufenfolge,* a hierarchical succession of categories, or 'spiritual forms', more and more adequate to the Absolute's concreteness, Gentile openly denies that spirit's development unfolds 'in a series of typical degrees'.[19] For its self-identity is *equally immanent* in all 'concrete' moments in which its evolutionary process is being articulated. In fact, if one should admit, with Hegel, a hierarchy of spiritual forms, the Absolute and the higher ones would turn out to be (at least relatively) *transcendent* to the most elementary and inadequate ones. And this would undermine the fundamental methodological assumption of 'actual idealism': i.e. the 'absolute immanence' of truth to self-conscious thought.

This is not the place to try to strike a balance (however summary) of Gentile's

philosophy,[20] still less of his 'reform of Hegelian dialectic'. As compared with the speculative doctrine from which it stems, it might certainly be regarded as little more than a mere 'simplification'[21] of it that risks mutilating, if not even irreparably distorting, the rich, systematic complexity of Hegel's thought. Yet in such a case one would too easily forget that that concept of 'spirit' as 'pure act', on which all of Gentile's theoretical reflections and constructions hinge, does constitute the most living, profound and up-to-date aspect of the whole Hegelian system. Moreover, while Hegel distinguishes religion from philosophy only owing to their 'form', and emphatically asserts the identity of their 'content', thus seeming to forget that according to his own logic[22] they on the contrary determine each other, Gentile's distinction between religion as the 'abstractly objective' form of spirit and philosophy as the fully 'concrete' and 'actual' one does bring to light a difference concerning their very content, and thus saves—against Hegel—the validity of his very principle of the mutual determination of the form and the content of thought.

Finally, an undeniably original, creative development of Gentile's thought with respect to Hegel's is certainly to be found in his pedagogical theory. The dialectical opposites that are constitutive of the educational act, which he conceives as an essentially 'spiritual' activity, are the subjectivity of the 'pupil' and the objectivity of 'science', which is embodied in the person of the 'teacher'. As long as these two terms of the educational relation remain in the 'immediate' form of their mutual exclusion—which constitutes, as such, the original 'antinomy of education'[23]—no real spiritual progress in the pupil's self-consciousness can take place. For it to occur, indeed, it is necessary that the latter should turn the teacher's objectivity into his or her own self-consciousness, thus becoming, in a sense, the 'teacher of himself or herself. In the fullness of the educational act, Gentile profoundly observes, the pupil 'does learn, and throbs and lives in the teacher's word, as if he heard a voice sound in it that bursts out from the inwardness of his own being'.[24] Any true knowing, therefore, is never mere passive learning of dead and fragmentary notions, but rather free spiritual creation of knowledge by the pupil's inner personality. The spirit which 'actually' thinks, Gentile concludes, is always, in one way or another, an 'auto-didact'. From his deep-rooted conception of education as a 'spiritual' process Gentile does not fail explicitly to draw a consequence that seems to me to be still today of the utmost cultural relevance and upto-dateness. True culture and education is only that in which the human mind knows and 'creates' itself. Hence it is an essentially *humanistic* (philosophical) culture and education. Any technological cognition or ability (which as such constitutes the object of what he calls 'realistic instruction'),[25] therefore, can be legitimately ascribed some sort of meaning and value only to the extent that it constitutes a useful (although of necessity always subordinate) *means* for the pupil's *spiritual formation,* this being in one both philosophical and ethico-political.[26]

'ABSOLUTE HISTORICISM': BENEDETTO CROCE

Both to Hegel and to Gentile 'the Absolute is Subject', and as such it necessarily manifests itself in humanity's *historical* development. Yet this does not mean at all that for them historical reality, as a multiplicity of spiritual 'facts' or events, and historiography, as the subjective representation of such a reality, constitute, respectively,

the unique true actuality, and the only possible 'objective' knowledge of which the human mind could dispose. Any historico-factual manifestation of the Absolute, as such, is incurably 'finite', and thus inadequate to its pure ideal self-identity, whose full concreteness is actualized only in the process of 'absolute knowing' (Hegel) or of the *autoconcetto* (Gentile), as absolute identity of knowing and the will. The 'absolute historicism' of Benedetto Croce (1866–1952), on the contrary, aims at resolving without residue any possible reality into historical facticity. The fundamental error of any metaphysical speculation consist in the *filosofismo,*[27] i.e., in the illegitimate claim that the concept's immanent development would of itself be able to offer us an adequate knowledge of objective reality. Croce appeals to Kant's famous dictum that 'concepts without intuitions are empty, and intuitions without concepts are blind', in order to vindicate the element of the intuitive, individual, 'historical' representation as an essential condition for any possible knowing. Actual knowledge, then, is neither the pure concept (as metaphysics, and especially Hegel's 'panlogism', maintains),[28] nor the singular sensuous representation (as empiricism generally holds), but rather the logical activity of the 'individual judgment',[29] in which the human mind predicates of an historico-individual 'fact' four fundamental 'categories' (the Beautiful, the True, the Useful, the Good), to which Croce ascribes universal, necessary and thus a priori validity.

But is not nature's reality itself constituted by a multiplicity of individual 'facts', and do not the natural 'laws' which the positive sciences discover in such facts imply some sort of a priori cognitive 'forms' (e.g., space and time) or 'categories' (causality, substance, etc.) either? Why, then, restrict the area of application of the 'individual judgments' to historical reality alone? Croce resorts to the idealistic principle of the identity of being and consciousness in order to deny in principle the actuality of any alleged natural, and then extra-mental, facts. On the other hand, he borrows from one of the most fashionable *Wissenschaftstheorien* (theories of science) of the early 1900s, Mach's and Avenarius's 'empiriocriticism', the idea that the concepts and laws of the positive sciences are devoid of intrinsic universality and necessity, and are rather 'abbreviations' of a contingent plurality of sensuous, particular representations, which are worked out only in view of their practical *utility,* this consisting in the 'economy' of mental 'effort' which their employment would allow to the scientists.[30]

Having denied the reality of the Absolute and of nature, and consequently the truth of metaphysics and the positive sciences, Croce can easily identify the whole theoretical activity of the human mind with *historiography*. Philosophical knowledge differs from it only as the reflective explication of the conditions for the possibility of those 'logical a priori syntheses' (the 'individual judgments') which the actual historiographical praxis mostly carries out in an unconscious way. Contrary to what all great metaphysicians had concordantly maintained, then, philosophy can no longer be regarded as an 'autonomous' science but as the mere 'methodological moment of historiography'.[31] Its specific subject matter would consist, in substance, in a clarification of the contents and mutual relations of those a priori categories which constitute, as we have seen, an essential moment of the 'individual judgments'. The category of the Beautiful coincides with spirit's *artistic* activity, or sense-perception, and its essential products are just those individual intuitive representations which become the subject of the judgments laid down by spirit's *logical* activity.[32] This latter, then, does not exhaust as such the essence of the category of the

True, whose concrete content, rather, turns into the multiplicity of the individual judgments historical knowledge consists of. As to the category of the Useful, according to Croce it defines a form of spirit's activity no less concrete and 'autonomous' than art, knowledge or morality. In this regard, the influence of Marx's thought on Croce, through the mediation of its 'humanistic' interpretation worked out by Labriola at the end of the nineteenth century (see p. 350), *is* undeniable.[33] Unlike Hegel and Gentile, who emphasize the fact that the economic activity of the human mind is but the 'phenomenal', 'negative', 'abstract' side of the only true practical activity, i.e., moral activity as social morality *(Sittlichkeit, eticità)* or ethico-political praxis, to Croce the world of economic processes and relations instead constitutes a fully actual and autonomous factor in human history. Of course, since Croce identifies being in general with history, and defines this latter in terms of 'spirit', he can acknowledge the actual reality of economy only by interpreting the latter as a human activity no less 'spiritual' than, e.g., aesthetic contemplation or historical knowledge. As to the category of the Good, finally, Croce decidedly rejects Hegel and Gentile's contention that it can be concretely embodied only in social institutions. As was already the case with Kant, he confines moral activity to the private sphere of individual conscience, or, at best, to those social relations which an individual can freely join.

These are the main lines of the 'philosophy of spirit' set forth by Croce in his four 'systematic' works: *Estetica come scienza dell'espressione e linguistica generale (Aesthetics as the Science of Expression and General Linguistics)* (1902 [10.15]), *Logica come scienza del concetto puro (Logic as the Science of the Pure Concept)* (1905 [10.16]), *Filosofia della pratica (The Philosophy of Practice)* (1908 [10.18]), and *Teoria e storia della storiografia (A Theory and History of Historiography)* (1917 [10.19]). In the later years of his long literary, philosophical and political career, he seemed deeply to modify such a conception, at least with respect to two fundamental issues. On the one hand, in his *Storia d'Europa nel secolo decimonono (A History of Europe in the Nineteenth Century)* (1932 [10.20]),[34] he sees at the root of the progressive historical realization of the ethico-political ideal of 'liberalism' the spiritual energy of a new 'religion', although non-confessional in character: the so-called 'religion of freedom'. In the systematic exposition of his 'philosophy of spirit', on the contrary, religion is not regarded as a peculiar form of spirit's activity. On the other hand, in his *La storia come pensiero e come azione (History as Thought and as Action)* (1938 [10.22]),[35] he denies that the category of the Good constitutes, as such, a 'distinct' and autonomous form of spirit's life. Now morality seems to him to turn without residue into each of the three previous categories: the True, the Beautiful, and the Useful. Furthermore, in an essay collected in his last book, *Indagini sullo Hegel e schiarimenti filosofici (Inquiries into Hegel and Philosophical Explanations)* (1952 [10.23]),[36] he stresses the spiritual form of 'vitality' *(vitalità)*—which coincides, at least *prima facie,* with the category of the Useful—as the unique, common origin and 'root' of all the 'distinct' forms of spirit, whose 'autonomy', on the contrary, he had once so emphatically vindicated.

Despite the wide influence exerted by Croce's 'historicism' on twentieth-century Italian and European culture, I do not believe that he was actually able to offer a speculatively relevant contribution to the development of philosophical thought in our age. Elsewhere I have pointed out those which seem to me to be the fundamental

shortcomings both of his general conception of history and, in particular, of his logic.[37] Here I can confine myself to remarking that Croce's negation of the possibility of metaphysics is based upon the uncritical ontological presupposition of the actual reality of the 'finite' (as 'historical fact'). As soon as its intrinsic negativity becomes evident to self-conscious reflection, the radical inconsistency of such a presupposition can easily be unmasked. Second, the empiriocriticistic and Crocean denial of the universality of the concepts and laws of the positive sciences turns out to be possible only by surreptitiously presupposing the immediate evidence of sense-perception, which in truth is no less negative and contradictory than the 'finite' as such. Third, Croce declares that the four 'categories' in which he articulates the essence of spirit's development are a priori, i.e., 'universal' or absolute (and this is just the reason why, as against historical relativism, he defines his own philosophy as '*absolute* historicism'). A merely historico-inductive justification of their peculiar content and relations, then, is clearly out of place. The only possible foundation of their objective validity would obviously be their 'deduction' (however this may be conceived). Now, in no passage of his extensive writings does Croce appear to be able to provide us with the least 'deduction' of the specific categorial content of his 'theory of the distincts', and still less with any coherent conception of their mutual 'dialectical' relations. On the other hand, the groundlessness of his claim that they are a priori is proved *ad oculos* by his subsequent reduction of their number through the suppression of the category of the Good as an autonomous form of spirit's life as well as by his conclusive resolution of the whole categorial order into the sensuous immediacy of the *vitalità*. Fourth, how is it possible meaningfully to speak of an alleged 'religion of freedom' while at the same time openly *denying* (unlike Gentile and Hegel!) that religion as such is a specific form of spirit's dialectical development? Finally, Croce's vindication of the a priori character of the category of the Useful and, correlatively, of the 'spiritual' value and meaning of man's economic activity *as such* clearly implies the absurd transmogrification of a merely *external* and *finite* categorial relation such as that of 'utility'[38] into a self-contained, 'infinite' concept, since *any* authentic 'spiritual' category must necessarily be such. The final outcome of Croce's critical destruction of metaphysics in general, and especially of his sometimes very virulent polemic against Hegel's and Gentile's thought, then, appears to be, on the one hand, the sanctification of the most immediate, arbitrary and egoistic *utilitarian interests* of the 'private' individuals, and, on the other, the replacement of the living profundity of speculative thought with the dead superficiality of the most trivial and fragmentary historical *erudition*.

HISTORICAL RELATIVISM AND SCEPTICISM

Despite his polemic against Hegel and Gentile, Croce's historicism nevertheless holds to two fundamental assumptions of any *idealistic* philosophy: i.e., the identification of being with *consciousness* and the distinction, within the latter, between a system of *universal* (absolute) categories (or 'values') and the multiplicity of the particular, contingent representations which they somehow determine and qualify. A widespread theoretical and historiographical trend in twentieth-century Italian philosophy, represented especially

by former fellows of Croce and Gentile, although holding fast to the first assumption, decidedly rejects the second. It *is* a 'dogmatic' prejudice, they acknowledge, to assert the actuality of a reality different from, and transcendent to, human consciousness—broadly speaking, of an 'external world' (however this may be conceived). Yet this would not imply at all that there exists something like a Universal Consciousness or an Absolute Subject, or a mere plurality of a priori concepts, unifying the multiplicity of individual consciousnesses and of their historical, temporal and subjective contents in a universally valid objective experience. The very idea of 'truth' as an *absolute* norm and principle of human knowledge is regarded as nothing more than a 'metaphysical prejudice'. Not only do they deny the existence of a unique, universal truth, of which the manifold determinate truths would be but internal, organic manifestations, but human knowing could not even come to any intrinsic, 'apodeictic' *certainty* of the specific content of a mere plurality of finite, particular truths. Any judgments that can be actually stated, indeed, are always merely 'problematic'. According to the *problematicismo* of Ugo Spirito (1896–1979), such a relativistic, and in the final analysis *sceptical,* conception of knowing would be the unavoidable outcome of Gentile's dialectical logic itself. This, as we have seen, identifies the essence of spirit with its becoming. Yet as a 'theory of spirit as pure act' it cannot but negate itself *as* becoming to the very extent that it claims a priori, and thus immutable and eternal, validity for its own theoretical tenets. As a consequence, one can do justice to reality's intimate processuality only by denying, in principle, the possibility of anything like a 'general theory of spirit'—more generally, of *metaphysics* as such.[39] Reality would thus turn into a 'historical' flux of states of consciousness, in which any alleged universal or absolute truth and reality dissolves, as a follower of Spirito puts it, into 'an unrestrainable rhapsody of sensations'.[40] Any human knowledge would consist of nothing other than mere '[probabilistic assertions, hypotheses and conjectures', and these 'are propositions which reality itself, in its daily or even hourly becoming, undertakes to compromise in their objectivity and to defeat in their claim to universality'.[41] According to Raffaello Franchini (1920–90), metaphysics and (historical) becoming 'cannot get along with each other',[42] and the former's claim to an 'absolute unification' and to 'conclusiveness' must give place to the 'infinity of particular researches'.[43] 'The survival…of the metaphysical conception of philosophy is very harmful to philosophy itself.'[44] Although not hesitating to see in Croce's historicism the epilogue and culmination of the whole history of western dialectic,[45] Franchini declares that not even Croce 'can avoid paying a tribute to the archaic philosophy of Being, despite his effective polemic against it'.[46] Such a tribute would obviously consist in his 'systematic' conception of spirit's forms as 'distinct' a priori categories, whereas they too would be nothing else than the product of 'a distinguishing *activity,* which in the final analysis is the judgement which Croce himself did not by chance call "historical"',[47] i.e. merely contingent and relative.

It is out of place to go deeply here into a more detailed exposition and critique of the 'problematistic' and 'relativistic' outcomes of Italian idealism. In this context it will suffice to point out that, first of all, there is no actual contradiction between spirit's essential becoming and its reflective self-comprehension in a (metaphysical) 'theory' provided that the former is conceived (as with Gentile no less than with Hegel) not as mere temporal change but as 'eternal process': not as a simple negation of the eternal's

self-identity, but as a self-identity which *eternally* 'returns-into-itself from its 'self-alienation'.[48] Second, 'problematicism' and 'historical relativism', like any more or less radically *sceptical* sort of relativistic subjectivism, is plainly a *self-refuting* philosophical conception. For on the one hand it denies the metaphysical ideal of an absolute, 'definitive' truth; on the other, it undeniably ascribes absolute, 'definitive' value to its unjustified and unjustifiable, and therefore 'dogmatic',[49] denial of truth.

'CRITICAL ONTOLOGY': PANTALEO CARABELLESE

Not unlike Croce's 'historicism' or Spirito's 'problematicism', the philosophy of Pantaleo Carabellese (1877–1948) can itself be safely regarded as a critical reaction to 'actual idealism'. Yet what he sets against Gentile's metaphysics of the 'pure act' is not a subjectivistic and relativistic conception of historical becoming so much as an 'ontology' of the 'pure Object', of absolute Being. In any case, such an ontology is still based upon an *idealistic* conception of reality (unlike all the other trends of twentieth-century 'metaphysics of Being', which I shall examine below) in that Carabellese shares with Gentile and Croce the fundamental epistemological assumption that 'being is in consciousness'.[50] Hence he explicitly disallows any attempt to 'overcome'[51] consciousness and to make the latter dependent, in the manner either of naturalistic empiricism or of traditional dualistic metaphysics, on a reality radically alien to it. Any possible actuality is either an act, or an object (a content), of consciousness. The peculiar problematic of metaphysics thus comes to coincide, for Carabellese, with a 'critical' analysis of the immanent formal-general structures of consciousness as the only 'concrete' reality. He distinguishes in it two 'transcendental conditions' mutually connected: the 'subject' and the 'object'; and three 'determinate forms' of its activity, which also imply one another: 'feeling', 'knowledge' and the 'will'. In each of the latter it is possible to bring out a peculiar configuration of the subject-object relation. Carabellese's whole polemic against Gentile is rooted in a different, and even alternative, conception of such a relation. Setting out from Kant's famous contention that the 'objectivity' of a perception coincides with its intersubjective validity, i.e. with its 'universality', he identifies the very essence of the object as such with the most 'universal' concept, i.e. the indeterminate 'idea of Being'. Yet this latter, as Rosmini (see p. 350) had already pointed out against Kant,[52] is not to be regarded as the product of an act of the knowing subject. Rather, it is passively 'given' to it. But what about the 'singular' objects, e.g. 'this' pen 'here'? Carabellese appeals in this regard to Berkeley's immaterialism, and emphatically denies that consciousness can actually refer to an extended, material, bodily, etc. object.[53] The only objective actuality it can become aware of is a 'spiritual reality', and this coincides with the *universal* idea of Being. The subject of the act of consciousness, on the contrary, must necessarily be merely 'singular': 'one among many', a 'monad'[54] bearing a relation of 'mutual otherness'[55] to infinite other possible singular subjects. As a consequence, contrary to what Kant, Hegel and Gentile held, the *unity* of conscious experience cannot be the result of a spontaneous 'synthesis' by the subject (for this is 'in itself' merely passive and manifold). It will therefore be rendered possible by the object alone, which, as universal, is also of necessity *unique*.[56]

The universal uniqueness of the object, then, *unifies* the singular plurality of the subjects; these latter, conversely, *individuate* the indeterminate universality of ideal Being. As we have already said, this takes place in three 'determinate forms of consciousness', to which three distinct ideal objectivities correspond: to feeling the idea of the Beautiful, to knowing the idea of the True, to willing the idea of the Good. In polemic with Gentile, who held 'pure feeling' to be 'inactual', and identified knowing with the will in the concrete actuality of the transcendental Ego (see p. 356), Carabellese vindicates, no less emphatically than Croce, the mutual *autonomy* of such concepts (and, of course, of the corresponding forms of consciousness). Hence it turns out to be impossible to raise any of them to the unconditioned principle of the others. Yet, unlike Croce, he not only excludes economic activity (and the corresponding category of the Useful) from his 'table' of the 'determinate forms of consciousness', but also tries to offer something like a 'deduction' of their specific content, which should bestow on them that *necessity* of which Croce's 'theory of the distincts', as we have seen, is devoid. In this regard, Carabellese appeals to consciousness's *temporal* form. While Kant regarded time as the mere form of 'inner sense', according to Carabellese it expresses rather the inmost essence of the whole life of consciousness.[57] Hence he thinks it possible to 'deduce' from the three 'moments' involved in the essence of time—past, present and future—the concepts of the True, of the Beautiful, and of the Good in the following way:

> In the certainty of having already been, the subjects are said intellect, the object is said true, and the concrete act is said *knowledge;* therefore *knowledge is consciousness of the being that was, is consciousness of the past*. In the certainty of being now, instead, the subjects are said feeling; the object is said beautiful, and the concrete act is said *intuition;* this therefore is consciousness of the being that is, is *consciousness of the present*. Finally, in the certainty of having to be *[dover essere],* the subject is said the will, the object is said good, and the concrete act is said *action*. This therefore is consciousness of the being that will be, *consciousness of the future*.[58]
>
> Unlike Gentile (and Hegel), Carabellese refuses to deduce from the idealistic principle of the identity of being and consciousness the further consequence that the truth of immediate consciousness is the pure act of *self-consciousness*. For in such an act the Ego should be the object of itself; but to Carabellese, as we know, the object is essentially distinct from the subject (although being immanent in, and inseparable from, it). I therefore can be conscious of an object different from me (i.e., the idea of Being), but cannot possibly become aware of my own conscious act. The resolution of the objectifying act of consciousness into pure self-consciousness thus appears to Carabellese to be nothing less than 'the fundamental falsehood' of 'post-Kantian idealism'.[59]
>
> A summary critical examination of Carabellese's ontology suffices to show that it is certainly not preferable to Croce's 'historicism' as a plausible alternative to 'actual idealism'.[60] First of all, his attempt to deduce the 'determinate forms of consciousness' from the essence of temporality is quite unsuccessful. His raising of temporality from a mere form of 'inner sense' to the constitutive structure of consciousness as such appears to be wholly arbitrary

and unjustified. He does not seem to realize the intrinsic *negativity* (contradictoriness) of temporality, of whose 'moments' the past and the future, as such, *are not,* and the (sensuous) present is but an *abstract,* unreal limit between them. Moreover, if the origin of the concept of the True (and of knowing) lay in the temporal moment of the past, not only would the knowledge of the present and the future be obviously impossible, but also any logical and metaphysical knowing whatsoever (for this as such transcends the whole sphere of temporality). No less inconsistent is Carabellese's identification of the subject's essence with the 'plural singularity', and of that of the object with the unique universality of the idea of Being. As Kant himself, to whose authority Carabellese so often resorts, had already shown, I can become aware of a multiplicity (be it objective or subjective, and, in the latter case, be it the 'manifold' of the states of consciousness within the single subject or an 'intersubjective' plurality of individual subjects) only if I keep *self-identical* during the whole process of knowing in which I become aware of such a multiplicity. It is, then, the absolute identity of the self-conscious Ego, and not that of the object, which renders possible, in the final analysis, the 'synthetic unity' of concrete experience. Moreover, on what grounds can I assert that the object is 'in itself' *unique*? In effect, apart from the fact that sense-perception manifests an indefinite *plurality* of singular objects ('this' pen 'here', etc.), *all* objective *concepts* too, as determined, are essentially manifold. Only the *indeterminate* idea of Being is likely to be actually 'unique'. Yet, just as indeterminate, it is, in truth, but a mere 'abstraction', an empty *nothing*. How, then, can it render possible the objective unity of the 'concrete' as consciousness? Finally, Carabellese does not realize that his denial of the possibility of self-consciousness undermines nothing less than the most original conditions for the possibility of his own idea of philosophy as a 'critique of the concrete'. For we already know that to Carabellese the 'concrete' coincides with consciousness, and that his 'critique of the concrete' consequently turns into a reflective explication of consciousness's formal-general structures. Such an explication is obviously an act of consciousness. But its object, unlike that of 'immediate' consciousness, is by no means the indeterminate idea of Being, but *the very concrete actuality of knowledge,* so that it clearly takes the shape of a determinate form of *pure self-consciousness,* whose real possibility, then, it as such proves, as it were, *ad oculos*.

'MYSTICAL IDEALISM': PIETRO MARTINETTI

When outlining the historical genesis of 'actual idealism' I have remarked that it stems from Hegel's idealism through the mediation of its interpretation by Spaventa in the nineteenth century. And the conceptions of thinkers such as Croce, Carabellese, Spirito, etc., can to a great extent be regarded as a mere reaction to Gentile's philosophy. The thought of Pietro Martinetti (1872–1943), on the contrary, derives both its concrete problematic and its fundamental speculative inspiration from a direct, and very detailed,

acquaintance with the German idealistic tradition from Kant[61] to the neo-Kantianism of Riehl, Wundt and others. Not unlike the other exponents of Italian idealism, however, for him too the term 'idealism' fundamentally means an epistemological conception of the subject-object relationship according to which the latter is nothing more (nor less) than a pure immanent content of consciousness. The entire world-becoming thus turns without residue into that of consciousness. '[T]he reality which is given us in perception is conscious reality itself, and nothing other than it.'[62] If consciousness is considered from the standpoint of its immanent multiplicity, it constitutes the object. If, conversely, it is considered from the viewpoint of its active, unifying function, it constitutes the subject or the 'Ego' *stricto sensu*. The peculiar orientation of Martinetti's philosophical idealism with respect to that of Croce, Gentile or Carabellese is revealed, in my opinion, by two fundamental aspects of his thought. On the one hand, he seems to hold that a clear understanding of consciousness's process can be offered us rather by a *psychological* analysis of our inner experience than by a purely logical deduction of its a priori forms (Fichte, Hegel). Indeed, he does not hesitate to define his own position in terms of 'psychological idealism',[63] and to lay down a very favourable judgment about the 'idealistic empiricism flourishing in contemporary philosophy'[64]—for example Schopenhauer's theory of 'representation' or Schuppe's and Schubert-Soldern's 'philosophy of immanence'. But, on the other hand, no less crucial than the influence of that 'psychologism' which held sway over German thought at the end of the nineteenth century is that of *pantheistic mysticism*—from the Indian philosophy of the 'system' Sankhya (to which he devoted his doctoral dissertation) to the metaphysics of Plotinus, Spinoza[65] and the later Fichte. In substance, according to Martinetti, the analysis of psychological experience *is* a necessary moment of the process of knowing, but only as the groundwork for the construction of an 'idealistic metaphysics'[66] of the Absolute as an immanent Whole.

The fundamental philosophical principle bestowing unity and coherence on Martinetti's thought, in fact, has little or nothing to do, in my opinion, with psychological experience, but seems rather to coincide with the chief speculative assumption of Plotinus's metaphysics.[67] The most universal categories on the basis of which it is possible to interpret to totality of experience are Unity and Multiplicity. Contrary to what Hegel (and, before him, Plato himself at least in the *Parmenides*) maintained, they are, as such, *mutually exclusive*. This means that in an entity, experience or concrete spiritual activity, the more the moment of unity prevails, the less relevant the role played by multiplicity becomes, and conversely. The implications of such an assumption are not only ontological but also axiological and ethical in character. Unity is the principle of the intelligibility and 'perfection' of an entity; multiplicity, on the contrary, that of its irrationality and 'imperfection'. As a consequence, the differences revealed by our experience of the world and the Ego are ordered in a hierarchical succession, at the lower levels of which the moment of multiplicity predominates, while unity is the peculiar feature of the higher ones. Absolute Reality, therefore, is to be identified with an absolutely 'formal', 'indeterminate' Unity, devoid of any content, properties, relations, etc., since these are all clearly unthinkable apart from the manifold. Any other form of unity, even the 'concrete unity' of the system of Plato's 'ideas' or of Hegel's 'categories', is but mere *appearance*. Since intelligent activity too involves a manifold content (the

plurality of the concepts which it distinguishes and/or unifies), the Absolute Unity necessarily *transcends* intelligence itself. 'But also this intelligible world is nothing else than a relative expression of a unity which in itself transcends intelligence.'[68] This latter, Martinetti rightly points out, is but a 'development' *(potenziamento)* of 'consciousness'. As a consequence, the Absolute Unity will transcend the totality of conscious experience as well: 'the highest constructions of logical thought are imperfect expressions of a Reality whose absolute unity transcends any consciousness'.[69] Although, then, all of our world-experience turns without residue into a dynamic, hierarchical succession of forms and states of consciousness, the ultimate aim (which to Martinetti, just as to Hegel, is at the same time the 'absolute foundation' of the whole cosmic becoming) of its evolution is not a possible act or content of consciousness.

It should be noted, however, that Martinetti's insistence on the absolute *epistemological* transcendence of Unity to consciousness does not exclude an unambiguous vindication of its substantial *ontological immanence* to the multiplicity of phenomenal experience. Perhaps the most intriguing aspect of Martinetti's metaphysics seems to me to be precisely his unrelenting polemic against the traditional theistic conception of God as an absolutely transcendent, 'otherworldly' entity. For him, on the contrary, the absolute, 'divine' unity is immanent even in the most negligible details of world-becoming.

> And therefore, as Leibniz already saw, every single phenomenon always expresses in the unity it realizes the unity of the world to which it belongs; every most simple unity reflects, owing to the infinite multiplicity of its factors, the universal order of existences; every most trifling being encloses in the mystery of its laws the secret of the world.[70]

The vulgar conception of the (first) cause as external to its effects *(causa transiens)* is to be rejected *in toto*. For the a priori necessity of their connection can be accounted for only by presupposing the intrinsic identity of them as their common foundation. But the cause, in truth, is not only identical with its effects: rather, it 'potentiates', 'reveals' itself in them.[71] In polemic with Aquinas and, more generally, with the whole scholastic ontology, Martinetti therefore declares: 'The whole system of the forms *in re* and *post rem* dissolves in such a case as an unhelpful complication. The world is but the very system of the divine thoughts, of the forms *ante rem,* that, before the obscure power of sense, as it were breaks and is refracted in the indefinite multiplicity of sensuous appearances.'[72]

Martinetti's reference to the 'obscure power of sense' in this passage is critical for the interpretation and evaluation of his whole philosophy. For his doctrine of sensible knowledge is perhaps that which gives rise to the greatest difficulties in his theoretical perspective. I have said that to Martinetti the manifold is a principle of unreality and imperfection, and that the more the process of consciousness approximates the Absolute Unity, the less relevant the former's actuality becomes. 'Sensible intuition' is obviously the most rudimentary phase in consciousness's development, since its content coincides with the heterogeneous, unreal multiplicity of material things and of sensuous qualities. A loose unification of the manifold is rendered possible, within the sphere of sense, by the

(relatively) a priori functions[73] of 'space' and 'time'. The whole sphere of spatio-temporal reality, then, becomes the content of further, higher-order *logical* unifications by virtue of the fundamental categories of 'causality'[74] and 'logical identity'.[75] Now, not unlike Hegel, Martinetti explicitly declares that in the evolution of a lower form of spirit into a higher one the latter represents the 'truth', the 'actual reality' of the former, which with respect to it turns out to be 'virtually negated': 'the logical unity is not a reality coexisting with pure sensuous multiplicity, is not a reality of the same degree, but is a qualitatively higher reality, which *virtually denies sensuous reality*.'[76] Yet, on the other hand, he tries to differentiate his own position in this regard from Hegel's 'panlogism' by asserting that the logical unification of the sensuous 'given' does not undermine its autonomous, independent *reality:* 'An abyss subsists between the logical world of panlogism and sensuous reality.' 'The sensible and the logical order are two absolutely distinct orders, and their forced overlapping only succeeds in bringing out—here better than elsewhere—the absolute impossibility of making them coincide.'[77] The sharp contradiction in which Martinetti's thought here gets entangled is self-evident. In effect, in the final passage of his major work he himself somehow tries to solve it by declaring that 'if from the logical viewpoint the distinction between logical and sensuous reality turns into the distinction between being and not-being…from the absolute viewpoint both are but two subsequent forms of one reality, which in its absolute form is neither the one nor the other'.[78] Yet we know that for Martinetti the 'absolute viewpoint' is that of the absolutely 'formal' Unity, which as such radically transcends any consciousness and intelligence. How, then, can *we* take up such an alleged 'absolute viewpoint'? The 'logical' viewpoint therefore remains the only one we can legitimately resort to (and, strictly speaking, not only 'we', but also a possible infinite 'divine' *intelligence*). Hence his vindication of the original autonomy of sensuous reality is clearly self-refuting, and consequently his attempt to differentiate his own position from Hegel's 'panlogism' turns out to be, at least in this regard, quite unsuccessful.

The other fundamental objections that Martinetti's idealistic monism raises against Hegel's philosophy concern the dialectical method; his doctrine of the immanent becoming of the logical Idea; his identification of the latter with the very Absolute Reality; and finally his 'realistic' admission of the possibility of a philosophy of 'nature' as the process of the Idea in a still 'unconscious form'. Given the validity of the idealistic principle of the identity of being and consciousness, how can one still deem it possible to construct a priori a succession of natural categories that is not, at the same time, the content of a series of subjective 'syntheses' of consciousness? Martinetti's reproach to Hegel's thought, in this regard, is clearly that it is not yet sufficiently 'idealistic'. It seems to me to be historically enlightening to point out that the gist of this Martinetti objection coincides *in toto* with one of the fundamental results of Gentile's 'reform of Hegelian dialectic': i.e., the denial of the possibility of any dialectical process which is not the pure becoming of the *pensiero pensante,* i.e. of the self-conscious Ego (p. 356).

As for the relation between the Hegelian Idea and Absolute Reality, it is undeniable that, if the latter really is, as Martinetti maintains, a Unity which transcends any multiplicity, and therefore the very element of consciousness and intelligence, it cannot possibly coincide with Hegel's Absolute Idea, which is indeed the pure self-consciousness of a systematic totality of thought-determinations. Moreover, any

becoming (be it temporal or logical) is clearly possible and thinkable only as a synthesis of unity (continuity) and multiplicity (discretion, as the *plurality* of the successive 'phases' discernible in it). If, then, Absolute Reality is actually devoid of any multiplicity whatsoever, becoming must certainly be nothing more than a mere 'phenomenon'. The Absolute Unity, therefore, is *eo ipso* absolutely motionless and static. Finally, according to Martinetti (who strangely seems to share, in this regard, some of the most popular tenets of contemporary logical empiricism), there are only two scientifically valid 'logical' methods: 'analysis', which is merely formal and reconstructive in character; and 'synthesis', or 'induction', which consequently is the only method actually able originally to constitute, and then to extend, our knowledge. The latter's 'genetic order', he says, 'is invariably inductive, and springs forth from a unique source which is experience'.[79] As a consequence, induction is the proper method not only of the *positive sciences* but also of philosophy itself. As a consequence, the only real difference between them is that, while the positive sciences limit themselves to a more or less 'relative' unification of the multiplicity of the immediate 'given', philosophy on the contrary essentially aspires to a 'total', 'absolute' unification. The undeniable non-inductive character of Hegel's dialectical method, then, would ineluctably undermine the 'scientificity' of his 'panlogistic' conception of the Absolute. In Martinetti's critique of Hegelianism, then, (psychological) empiricism and (immanentistic) mysticism work hand in hand in a somewhat surprising way. While, indeed, his rejection of the dialectical method (like his theory of sensible intuition I have outlined above) relies on arguments of clear empiricist origin, his polemic against Hegel's Absolute Reason has no other ground, nor any other aim (so at least I believe), than the vindication of the ontological and ethical primacy of *mystical-religious experience* over rational-philosophical thought. In fact, on one occasion he does not hesitate openly to define in terms of 'mysticism' the deepest possible form of unity between the Absolute and the human mind: 'our knowing…is an act of mystical union with the eternal Logos which is the absolute ground of our nature.'[80]

The plausibility of Martinetti's anti-Hegelian polemic thus appears to depend *in toto* upon two decisive speculative assumptions: (1) the epistemological validity of induction; and (2) the ontological reality of an absolute Unity absolutely devoid of any moment of difference or multiplicity. But, in truth, Aristotle and Kant had insightfully pointed out already in the antinomy of 'complete induction' the irremediable shortcoming of the inductive method; and Plato, in his *Parmenides,* had already brilliantly shown that the statement 'The One is' actually means the very opposite of what it purports to mean, i.e. the *unreality* of the One as One. For the existential predicate 'is' constitutes of itself an element *different* from it, and thus immediately posits an *original manifold* in the alleged pure 'unity' of the One itself.

METAPHYSICS OF BEING

The peremptory rejection of the 'idealistic' identification of being and consciousness and the unrelenting polemic against all the logical, metaphysical and ethical consequences drawn from it by both Croce and Gentile constitute the fundamental and historically most

relevant features of a widespread tendency in twentieth-century Italian philosophy which one could generally define in terms of 'metaphysics of Being'.[81] The divergences among the spiritual traditions of (1) Thomism, (2) Augustine's and Rosmini's 'spiritualism', and (3) Kierkegaard's mystical irrationalism—to which thinkers such as (1) Armando Carlini (1878–1959), Augusto Guzzo (1894–1986), Gustavo Bontadini (1903–90), and Michele Federico Sciacca (1908–79), (2) Francesco Olgiati (1886–1968) and (3) Luigi Pareyson (1918–91) respectively go back—turn out to be negligible as compared with the substantial affinity of both the theoretical content and the historico-cultural finalities of their philosophical activity. Being, Truth, the Absolute, God, they maintain, radically *transcend* the whole sphere of self-consciousness, and especially the activity of rational thought. Even those who are most willing to acknowledge the actuality and value of speculative reason, i.e. the neo-Thomists, hold nevertheless that this is a function of spirit which is in the final analysis *subordinate* (or rather: 'subaltern') to an alleged more original immediate *intuition* of the 'idea of Being'—and, a fortiori, to religious revelation such as is sanctioned by the authority of the Roman Catholic church, and to mystical experience. 'The absolute objective truth', Sciacca declares, 'is before its being known, and it would remain such even though no thinking subject ever knew, or sought for, it.'[82] '[T]he *ratio* is a cognitive power inferior to the *intellectus,* on which it depends.'[83] 'What counts,' Pareyson echoes him, 'is not reason, but truth.'[84] The vindication of the absolute epistemological transcendence of truth to human self-consciousness finds a close counterpart, at the ontological level, in their common intent to 'restore', as Bontadini openly says, in contemporary philosophy and culture a decidedly 'dualistic' conception[85] of the relations between God and man, process and eternity, spirit and nature, the One and the Many, etc. '[*Transcendence* means *duality,* immanence means *monism*', Sciacca asserts. 'The condition of culture turns out to us still to be the dualistic conception of the reality of "this" world and of that of the "other" world, of the world of man and of the world of God.'[86] 'Hegel's *Gottin-Werden* [God-in-becoming] is a nonsense, in that one uses the term "God", but one ascribes to him a predicate that denies him, that is contrary to his nature.'[87] From this dualistic ontological perspective the reality of nature, of life, of the 'cosmos' cannot obviously but be regarded as something quite alien to spirit, and as such even unworthy of philosophical consideration. 'Analogy', Guzzo maintains, 'can be held to be the only means truly fit to dispel any temptation of identifying nature and man, either in the naturalistic sense of a reabsorption of man into nature or in the sense of an idealistic epistemology which aims at drawing back and dissolving "nature" into "spirit"',[88] In his polemic against the metaphysical reality of nature, Carlini goes as far as to accuse of *cosmologismo,* i.e. of naturalism, the very 'Christian Neoplatonism with its *Ens Realissimum*'![89]

According to Olgiati, 'if there were no realities there would be no relations, for it is not the relations which create reality, but it is reality which gives rise to the relations'.[90] In Bradley's terminology one could say that the fundamental ontological point this neo-Thomist intends to make is that the only actual relations are the 'external' ones occurring among an original plurality of logically indifferent entities that are irreducible to any higher, more concrete Unity or organic Totality. No surprise, then, that in the light of such an ontological conception of reality as mere plurality the *only* concept of man's personality that appears to be tenable to the upholders of the metaphysics of Being is still

that of the traditional 'soul-substance', i.e. of a self-contained, finite and contingent entity. '[T]he concept of person', a follower of Sciacca observes, 'cannot avoid that individualistic-intimistic closure which seems to be wholly peculiar to the level of singularity.'[91] Its only possibility of, and hope for, 'immortality', consequently, far from consisting in its absolute identity with the Totality of the cosmos and human history, will rather coincide with its alleged indefinite duration 'after death' in the temporal dimension of the *future:* i.e., as Sciacca openly declares, with its 'ultramundane *[ultraterreno]* destiny'.[92]

If it is an indisputable merit of the upholders of the metaphysics of Being to have revived interest in the metaphysical problem in contemporary philosophy, one must also acknowledge that its statement and solution in the ambit of their philosophical perspective does appear to be wholly unsatisfying. The fundamental concept of 'Being' they concordantly resort to as the first and most original truth of the human 'intellect', indeed, is but a dead, unfruitful, *unthinkable* abstraction—both because it is devoid of any determinate content whatsoever and because it presupposes the actual *abstraction* from the concrete becoming of the 'act of thinking', of which, in truth, such a concept is a mere product, and which is thus necessarily presupposed by any alleged categorial negation of it. In other words, the self-conscious ('subjective') process of thinking cannot possibly be transcended, and consequently the object is originally and substantially *identical* with the subject. The dualistic conception of reality, which is on the contrary based on the original *opposition* of subject and object, is therefore inconsistent and untenable, and any attempt to 'restore' it in the spiritual life of contemporary humanity appears to be ineluctably destined to failure.[93]

MARXISM AND PHENOMENOLOGY

While for the upholders of the metaphysics of Being the fundamental shortcoming of Croce's and Gentile's idealism consists in its rigorously 'immanentistic' and/or 'historicistic' orientation, most theorists of twentieth-century Italian Marxism, on the contrary, regard it as the most 'living' and up-to-date legacy of the idealistic-Hegelian tradition (if not even of the whole history of 'bourgeois' philosophy). One can distinguish three main trends in Italian Marxism just on the basis of their different relation to that tradition. According to Antonio Gramsci (1890–1937), 'in a sense…the philosophy of praxis [i.e., Marxism] is a reform and development of Hegelianism'.[94] Croce's and Gentile's Hegelian idealism is therefore the only twentieth-century 'bourgeois' philosophy which he holds to be able to furnish a helpful conceptual contribution to the theoretical elaboration of historical materialism. Not unlike Croce's 'absolute historicism', indeed, 'the philosophy of praxis has been the translation of Hegelianism into a *historicistic* language'.[95] And not unlike 'actualism', it is itself a philosophy of the 'act'—even though not of the 'pure', but of the '"impure" *(impuro),* real act, in the most profane and mundane sense of this word'.[96] The possibility and necessity of an 'integration' of historical materialism with any other contemporary philosophical-cultural tendency whatsoever is emphatically rejected by Gramsci. 'Marxist orthodoxy', he says, consists 'in the fundamental concept that the philosophy of praxis is "self-sufficient", i.e.

contains in itself all the fundamental concepts needed to build up a total, integral conception of the world'.[97]

Quite opposed to the 'subjective'[98] conception of historical materialism worked out by Gramsci is the interpretation of Marx's thought as a 'logic of existence', or of 'contingent reality', put forward by Galvano Della Volpe (1895–1968).[99] In his opinion, Marx's methodology would bear a close resemblance to the 'kind of critical instances from which *modem experimental science* originates'.[100] In open polemic against Hegelianism, and, more generally, against any 'metaphysics' or 'mysticism', the school of Della Volpe (Mario Rossi,[101] Lucio Colletti,[102] etc.) stresses the radical difference between thought and being, vindicates the 'positive reality', the objectivity of the 'instance of *matter,* or the manifold, or the discrete',[103] and reduces Hegel's concept of 'reason' as a unity of opposites (an 'identità tauto-eterologica', as Della Volpe also says) to a merely logical ideal devoid of concrete actuality.

The interpretation of Marxism put forward by the 'Milan phenomenological school' founded by Antonio Banfi (1896–1957), whose most prominent exponent was probably Enzo Paci (1911–76), shares with Gramsci's the insistence on the 'subjective', 'humanistic' character of historical materialism, and on its consequent substantial divergence from any kind of traditional naturalistic and deterministic materialism. But the most radical, and up-to-date, understanding of human subjectivity would certainly not be the excessively 'speculative' and 'metaphysical' one worked out by Hegel's philosophy, so much as the 'descriptive' and 'intuitive' explication of its 'formal-general structures' rendered possible by Husserl's 'phenomenological' method. Whereas, then, for Gramsci Marxism is a 'self-sufficient' world-view, for Paci it needs to be 'integrated', and in some respects even 'rectified', by the most original theoretical achievements of 'transcendental phenomenology'.

The fundamental shortcomings of traditional idealistic philosophy, according to Gramsci, consist, on the one hand, in its being an 'abstractly' *theoretical,* or 'speculative', conception of the world which unduly ignores the essential *practical,* or rather 'political', origin and finality of any alleged 'autonomous' spiritual or rational activity; and, on the other, in its more or less explicit 'solipsism'. 'The history of philosophy', he asserts, is nothing more than 'the history of the attempts…to modify practical activity as a whole'.[104] 'One can believe in solipsism, and indeed *any form of idealism* necessarily falls into solipsism.'[105] Gramsci therefore goes on to set against the idealistic (rationalistic) principle of 'coherence' as truth criterion the more trivially *quantitative* one of the wideness of the consent which a philosophy (or rather, as he says, an 'ideology') enjoys in the 'masses'. The truth of a philosophy, he declares, 'is witnessed by the fact that it is appropriated, and permanently appropriated, by the majority *[gran numero],* so as to become a culture'.[106] 'One can say that a philosophy's historical value can be "calculated" by the "practical" effectiveness it has won.'[107] Also Gramsci's polemic against 'vulgar' materialism and positivism, which reduce in one way or another humanity's spiritual reality to the passive and ineffective 'superstructure' or 'epiphenomenon' of its material life, is based, in the last analysis, on grounds that are strictly practical-political in character. Idealistic philosophy is right to insist on the 'reality' of 'ideologies'—but not because they would express an 'eternal' or 'autonomous' being or truth so much as because the 'cultural factor' would constitute an

essential 'instrument of practical action'[108] in view of the establishment of the 'political domination', of the 'hegemony' *(egemonia),*[109] of one social class over another. 'According to the philosophy of praxis, ideologies are not arbitrary at all; they are *real historical facts*.'[110]

Far more akin to traditional materialism and positivism is Della Volpe's interpretation of historical materialism. In his opinion, Marx's Hegel critique would have rendered possible the foundation of philosophy 'as a scientific ontology, this being a *material ontology* and no longer a *formal ontology* or *metaphysics* as the traditional one from Plato and Aristotle up to Hegel'.[111] It would thus allow us to replace Hegel's 'metaphysics of the state' with a far more realistic 'sociology of the state', whose peculiar inspiration would be 'experimental' or 'Galileian'.[112] Its fundamental epistemological assumptions consist, according to Della Volpe, in the vindication of the original reality of the sensuous-contingent 'facts' (of the 'manifold') as well as of the objective validity of the principle of non-contradiction, of the 'finite understanding', of experiment, and of formal or 'classificatory' logic. Della Volpe decidedly denies the authentically 'scientific' character of Engels's 'laws of dialectic',[113] and against any activistic or pragmatistic interpretation of historical materialism insists on the fact that it is Marxism as a 'science' that grounds practical activity, and not conversely.[114]

In open polemic against 'naturalistic' materialism, and the very logico-experimental method of the positive sciences which would be but a peculiar form of the 'alienation' typical of 'bourgeois' society, Paci emphasizes no less than Gramsci the 'subjective', 'historical' character of Marx's concept of 'matter'. Yet, unlike Gramsci, he holds that it at least virtually finds a close counterpart in Husserl's conception of 'transcendental consciousness' as 'virtual intentional life' *(vita intenzionale fungente),* or as a 'world-of-life' *(mondo-della-vita)*. 'Inert matter is in some way *subjective*. Materialism is not a metaphysics of a substance *[sostanzialismo]* alien to the subject: I am the world, I am the whole world.'[115] The plausibility of an 'idealistic' interpretation of such a fundamental phenomenological conception is ineluctably undermined, according to Paci, by the fact that to Husserl consciousness is always originally and radically *sensuous, passive,* and *temporal,* even when it is regarded as a 'pure' transcendental 'function'. 'The error fraught with the worst consequences in the interpretation of Husserl's phenomenology is that of those who see in [Husserl's] Ego the consciousness or self-consciousness in the creative *[creativistico]* sense of idealism.'[116] The phenomenological analysis of the 'world-of-life' would thus render it possible to 'correct' the erroneous 'naturalistic' tendencies or interpretations of historical materialism without falling once again into the alleged 'categorial' abstractness of the 'idealistic' metaphysical tradition. The phenomenological point of view, Paci maintains, 'allows us…to stress the necessity and the conditioning of the material structure or of the structure of the needs on human-historical praxis, but forbids us, at the same time, to apply to history a scientific dialectic in the sense in which physics is scientific'.[117]

Except for the school of Della Volpe, then, Italian Marxism generally tends to emphasize the decisive role played by *human subjectivity* in the self-constructing process of history—and even of universal reality itself. Yet its uncritical allegiance to the assumption of the original reality and truth of sensible perception and praxis, of time and finitude, as fundamental constitutive structures of 'history', or even of the 'transcendental

consciousness', does not allow either Gramsci or Banfi and Paci to realize the 'abstractness' (in the sense of 'mutilated' one-sidedness) and thus contradictoriness of a 'subjectivity' that is not at the same time 'objective' (infinite), since the 'eternal' reality of the Absolute is not held to be immanent in it.[118] Furthermore, they do not seem to be sufficiently aware that their denial of the *unconditional* autonomy of logico-speculative reason (of the philosophical 'categories') in the final analysis undermines the 'coherence', and then objective validity, of any conception or interpretation (be it philosophical or scientific) of the very evolutionary process of human social history.

EXISTENTIALISM AND EMPIRICISM

The reaction against the speculative tradition of Italian idealism does reach a climax in the philosophical perspective of Nicola Abbagnano (1901–90) and his followers, which he defines in terms of both 'positive existentialism' and 'methodological empiricism' or 'neo-illuminism'. His interpretation of Heidegger's existential ontology, indeed, emphatically disallows any possible 'metaphysical stiffening'[119] of it, and reduces the method of 'existential analysis' to a mere empirical and contingent description 'of those human situations which can be regarded as "fundamental" or "essential" or "decisive" or as "limit-situations" *[situazioni-limite],* etc.'.[120] On the other hand, as the American pragmatists had already pointed out, that 'experimental method' which any empiricist philosophy is used to appealing to cannot and must not be conceived in a strictly 'theoretical' or 'objective' sense,[121] but as 'the structure of action *par excellence,* in that it is destined to modify such [human] situations'.[122] This is because to Abbagnano, just as to all existentialists, the 'being-in-the-world' of man is a 'relation to being' which is originally 'emotional' and 'practical' in character (something like a series of 'decisions'), and as such is absolutely alien and impenetrable to rational, theoretical consciousness. 'Existence cannot be enlightened by knowledge or by reason, but can throw light on them.'[123]

The originally 'irrational' nature of 'existence', according to Abbagnano, excludes the possibility that it might be adequately qualified by those ontological categories which most typically express the essence of pure rationality, such as universality, necessity, infinity, 'progress'. The only 'really existing man', he declares, is neither the Absolute Subject of the idealistic systems, nor the ideal of 'humanity', nor world-history, but nothing else than the 'singular individuality'.[124] This would be determined by a particular factual 'situation' which radically distinguishes it from any other human individual, and which one-sidedly conditions any possible 'activity'—or 'project'—of its own. Human existence, then, is by its nature 'contingent', 'uncertain', 'risky', and the most general ontological category needed to understand its fundamental structures is therefore that of 'possibility'. Indeed, the essence of 'freedom' itself would turn into the mere possibility of 'choosing' among a range of 'given' alternatives (or 'choices'), and therefore is not, nor can it in principle ever be, infinite or absolute. 'Existentialism asserts that man is a finite reality, that he exists and operates at his own risk and danger.'[125]

According to Abbagnano, then, the only object of which philosophy and the sciences can meaningfully speak is 'finite' (temporal, contingent, relative, etc.) reality. The

fundamental *idealistic,* or 'romantic', assumption that the finite as such is not actually real, but is rather the mere manifestation of a 'superior Reality'[126] (the Totality of the Universe, Spirit, Absolute Reason, etc.), is purely 'mythological' in character. But not only is a unique, infinite Reality or Totality quite inexistent, but it does not even make sense to speak of 'absolute' *moral,* or 'spiritual', values. Also the faith in the objectivity of such values would be but a mere 'romantic' prejudice, and it is just the task of 'existential analysis' to show its inconsistency.

> Romanticism always has a certain spiritualistic bent. It tends to extol the importance of inwardness, of spirituality, as well as of the values that are called 'spiritual', at the cost of what is earthly, material, mundane, etc. Existentialism shamelessly recognizes the importance and value for man of externality, of materiality, and of 'mundanity' in general, and thus of the conditions of human reality that are included under these terms: the needs, the use and production of things, sex, etc.[127]
>
> [F]rom the empirical standpoint, the moral problem cannot obviously be coped with by resorting to an apology for morals, or by claiming to be able to establish hierarchies of 'absolute' values, which ought to provide us with necessary criteria for evaluation.[128]

The fundamental philosophical error that undermines the 'positive existentialism' of Abbagnano and his followers throughout is the absurd claim that the human subject may become 'immediately' aware of its own 'existence' as a 'structure' originally 'other' than rational self-conscious thought. In truth, any reliance on the 'evidence' of 'immediate', sensible, 'pre-logical' perception, intuition, praxis, etc. is purely illusory, since it does not account for the intrinsically 'mediate' character of any subject-object relation, and, furthermore, for the fact that any 'mediation', connection or 'relation', in the last analysis, is nothing more (as Kant had already stressed) than a product of the 'synthetic' activity of the pure self-conscious Ego. And even the most elementary act by which this 'posits itself necessarily involves (as the 'dialectical' development of its pure immanent content could easily show) the objective validity of those very categories of 'necessity', 'universality', 'infinity', etc., which Abbagnano's 'positive existentialism' dogmatically denies, or rather is simply unable to account for. In face of the luminous 'self-evidence' of the thinking concept's immanent self-explication, then, all the too often banal, trivial, and worn-out arguments of his polemic against 'romanticism' and 'idealism' cannot but 'dissolve as fog in the sun'.

CONCLUSION

If now, having come to the conclusion of this brief outline of twentieth-century Italian philosophy, we take a fleeting retrospective glance at its most significant vicissitudes and achievements, we can first of all remark that the debate between the upholders and the adversaries of idealist-speculative thought does constitute the crux of its whole development. It is undeniable that in the second half of the twentieth century the anti-

idealistic trends—empiricism, existentialism, phenomenology, Marxism, dualistic metaphysics, etc.—have somehow prevailed. Yet this does not mean at all that their contributions to the progress of Italian philosophical culture have *eo ipso* turned out to be more convincing, valuable, or lasting. On the contrary, our summary analysis of their fundamental assumptions outlined above seems to have clearly brought out their indisputable theoretical inferiority with respect to both the content and the method of the idealistic perspective.

As far as the latter is concerned, then, we have witnessed the polemic between the rigorously dialectical, monistic, and 'speculative' development of the philosophical principle of idealism carried out by Gentile's 'actualism' and other antidialectical, pluralistic or historicistic forms of idealism such as Martinetti's mystical monism, Carabellese's 'critical ontology', and Croce's 'absolute historicism'. Despite the sharp critiques to Gentile's thought put forward by the latter, none of their speculative constructions can bear comparison—as to coherence, lucidity and intimate force of persuasion—with the theoretical perspective of 'actual idealism'. Hence this is and remains up to the present the essential reference point for any further development and progress of philosophical research in Italy.

This, however, is not tantamount at all to saying that a fair evaluation of the actual speculative achievements of Gentile's thought cannot and must not bring to light in it more than one fundamental limit.[129] In this context I can confine myself to remarking that the actual result of his 'reform of Hegelian dialectic' appears to consist, in more than one respect, rather in a one-sided formalistic 'simplification' of the very complex totality of Hegel's Absolute Idea than in the positive explication of a speculative truth which in the Hegelian system would still be merely implicit. After all, Bosanquet's famous objection to Gentile's philosophy—that it would be a sort of 'narrow humanism' which, unlike the Hegelian one, does no justice to the intrinsic 'dialectical' nature both of the logical categories and of the processes of natural reality—is likely to be sound and tenable. The *speculative task* which the critical reflection on the theoretical limits of 'actual idealism' proposes to contemporary philosophy thus seems to be the integration of the brightest and most fruitful idea of Gentile's thought—i.e., that Absolute Reality is the totality-in-becoming of self-conscious, active 'spirit'—with a 'holistic' and 'systematic' interpretation of the fundamental achievements of scientific and methodological research in our century such as is being developed, for example, by the latest and most significant trends of the philosophical tradition of Anglo-Saxon Hegelianism.[130]

48 'Relativistic historicism' is also the final outcome of the spiritual itinerary of one of the major Italian historians of philosophy, Guido de Ruggiero (1888–1948). See especially [10.25]. For a critique of his misguided polemic against Hegel's absolute idealism, which he accuses of 'theologism' and even of 'fetishism', cf. G.Rinaldi [10.82], part 3, ch. 2, note 87. The denial of the constitutive immanence of the logical universal in individual consciousness led Julius Evola (1898–1974) to identify the essence of the human subject with Nietzsche's 'will to power': cf. J.Evola, *Teoria dell'Individuo Assoluto* [10.27].
49 In fact, Franchini (not unlike, in this regard, the contemporary empiricists) denies the epistemological value of any possible logical 'foundation' or 'demonstration', as merely 'tautological' (cf. [10.30], 171). His very denial of the possibility of metaphysics, then, is to be held to be *ungrounded*—more the expression of individual subjective impotence than the ascertainment of human reason's objective, insuperable 'limits'.
50 P.Carabellese, *Critica del concreto* [10.11], 23. The second edition of this work considerably differs from the first, and can be legitimately regarded as the definitive version of Carabellese's 'critical ontology'.
51 *Ibid.,* pp. 101, 184.
52 And, after him, Bernardino Varisco (1850–1933), a spiritualistic and theistic Italian thinker who has remarkably influenced the development of Carabellese's thought.
53 In Carabellese's ontological perspective the very concept of 'nature' turns out to be simply nonsensical. As a consequence, he cannot but deny *in toto* the theoretical value of the positive sciences. Cf., e.g., *Critica del concrete* [10.11], 189.
54 *Ibid.,* p. 109.
55 *Ibid.,* p. 199.
56 In more than one context Carabellese does not even hesitate to identify the objective unity of the idea of Being with God himself (cf., e.g. *ibid.,* p. 7, note). In any case, since such an idea, as we know, is but an abstract 'transcendental condition' of knowing, radically *different* from the subject which is its other essential condition, he is bound to conclude, somewhat absurdly, that God as such *does not exist actually,* nor is he 'subject', 'person', 'self-consciousness', 'spirit' (cf. *ibid.,* pp. 151–2, 171, 194).
57 Cf. *ibid.,* pp. 113–15 and 181. Note the analogy of this Carabellese doctrine with Husserl's and Heidegger's more known 'phenomenological' conceptions of 'temporality'.
58 *Ibid.,* p. 24.
59 Cf. *ibid.,* pp. 126–39.
60 Garin rightly stresses the 'obscurity' and 'haziness of expression' of Carabellese's thought

(cf. [10.31], vol. 2, pp. 357, note 16, and 455). And R.Donnici suitably observes that 'as compared with Gentile and Croce's idealism, his most immediate polemical targets, Carabellese's critical ontology appears to be very frail' (R.Donnici [10.26], 7). In my opinion, this holds good more for his critique of Gentile than for that of Croce.

61 His book *Kant* [10.61] is devoted to a decidedly 'spiritualistic' interpretation of Kant's whole 'critical philosophy'.

62 P.Martinetti, *Introduzione alla metafisica* [10.55], 45.

63 *Ibid.,* p. 40.

64 *Ibid.,* p. 259.

65 To Spinoza's thought, which Martinetti interprets and criticizes from a substantially *neo-Platonic* point of view, he devoted numerous insightful essays. Cf. P.Martinetti, 'La dottrina della conoscenza e del metodo nella filosofia di Spinoza' [10.56], 289–324; 'La dottrina della libertà in Benedetto Spinoza' [10.57], (reprinted in his book *La libertà* [10.59]); 'Modi primitivi e derivati, infiniti e finiti' [10.58]; 'Problemi religiosi nella filosofia di B.Spinoza' [10.60]. For a general critical evaluation of Martinetti's Spinoza interpretation see my 'Introduction' to my Italian translation of E.E.Harris's book *Salvezza dalla disperazione. Rivalutazione della filosofia di Spinoza,* Milano: Guerini, 1991, pp. 29–31.

66 *Introduzione alla metafisica* [10.55], 261.

67 Cf., e.g., Plotinus, *Enneads* VI, 9.

68 *Introduzione alla metafisica* [10.55], 471.

69 *Ibid.,* p. 476.

70 *Ibid.,* p. 478.

71 Cf. *ibid.,* pp. 435–43.

72 *Ibid.,* p. 273.

73 I say 'relatively', because for Martinetti their ultimate psychological origin is itself merely empirical. They are a priori only with respect to experience's sensible qualities, which they unify in a 'unique', 'absolute' order. Cf. *ibid.,* pp. 423ff.

74 Cf. *ibid.,* pp. 434–43.

75 Cf. *ibid.,* pp. 443–55.

76 *Ibid.,* p. 468.

77 *Ibid.,* p. 403. Such a vindication of the autonomy of sensible intuition seems to find a close counterpart in Martinetti's critique of Kant's doctrine that the 'manifold' of sensuous impressions is merely subjective, and the objective unity is introduced in it only by the understanding's 'synthetic' activity. In his opinion, on the contrary, sense-perception is an inseparable unity of subject and object before, and independently of, its subsequent unification in the logical forms of thought (cf. *ibid.,* pp. 241–2).

78 *Ibid.,* p. 472.

79 *Ibid.,* p. 18.

80 *Ibid.,* p. 433.

81 Among the numerous, although often speculatively mediocre, writings of today's upholders of the metaphysics of Being, I confine myself to mentioning: F.Olgiati [10.66]; A.Carlini [10.12]; A.Guzzo [10.49]; V.La Via [10.54]; C. Mazzantini [10.63]; F.Olgiati [10.67]; V.A.Padovani [10.73]; M.F.Sciacca [10.87]; L.Stefanini [10.90]; F.Olgiati [10.68]; V.Mathieu [10.62]; M.F. Sciacca [10.88]; P.Prini [10.77]; G.Bontadini [10.10]; C.Arata [10.4]; C. Arata [10.5]; M.Gentile [10.46]; D.Pesce [10.76]; C.Fabro [10.28]; A.Guzzo [10.50]; L.Pareyson [10.74]. Guzzo's broad essay [10.48] is devoted to an excellent exposition of Spinoza's thought and to a lucid critique of it from a still 'actualistic' (and by no means 'spiritualistic' or 'neo-Thomistic') point of view. The reductive 'irrationalistic'

interpretation of Fichte's thought put forward by L.Pareyson [10.75] is, on the contrary, wholly questionable.

82 M.F.Sciacca [10.88], 36.
83 *Ibid.,* p. 163.
84 L.Pareyson [10.74], 147.
85 Cf. G.Bontadini [10.10], 4.
86 M.F.Sciacca [10.88], 241.
87 *Ibid.,* p. 206.
88 A.Guzzo [10.50], 77.
89 A.Carlini [10.12], 192.
90 F.Olgiati [10.68], 27.
91 C.Arata [10.5], 18.
92 M.F.Sciacca [10.88], 66–7.
93 A lucid, thoroughgoing critique of Thomism from the standpoint of Gentile's 'actual idealism' is carried out by Giuseppe Saitta (1881–1965) in his admirable essay [10.85].
94 A.Gramsci [10.47], 115.
95 *Ibid.,* p. 244 (my italics).
96 *Ibid.,* p. 54.
97 *Ibid.,* p. 195.
98 *Ibid.,* p 238.
99 G.Della Volpe [10.24], 36.
100 *Ibid.,* p. 123.
101 Cf. especially M.Rossi [10.84].
102 Cf. especially L.Colletti [10.13].
103 G.Della Volpe [10.24], 103.
104 A.Gramsci [10.47], 26.
105 *Ibid.,* p. 27.
106 *Ibid*.
107 *Ibid.,* p. 28.
108 *Ibid.,* p. 52.
109 *Ibid.,* p. 219.
110 *Ibid.,* p. 292. For a critique of Gramsci's Hegel interpretation see my book [10.79], vol.1, pp. 14f., 24f., 136f., 201f.
111 G.Della Volpe [10.24], 169.
112 Ibid., p. 121.
113 *Ibid.,* p. 201.
114 Ibid., p. 184.
115 E.Paci [10.71], 222.
116 E.Paci [10.69], 3. For his critique of Gentile's idealism see especially Paci [10.72]), 62–6. Husserl's theory of consciousness's 'original temporality' is developed by Paci especially in his essay [10.70].
117 [10.71], 226.
118 Banfi's open denial of the original truth and reality of the Absolute is unambiguously witnessed, for example, by the following passage: 'in general one must say that according to phenomenological thought an absolute reality is as absurd as a round quadrilateral, for there is nothing absolute but the ideal moment of pure immanence' (A.Banfi [10.6], 94–5). For a more detailed exposition and critique at Banfi's and Paci's 'phenomenological Marxism' see my book [10.78], Appendices, pp. 214–31.

119 N.Abbagnano [10.2], 157.
120 *Ibid.,* p. 156.
121 Cf. Abbagnano [10.3], 45–9.
122 [10.2], 156.
123 [10.3], 48.
124 *Ibid.,* p. 47.
125 [10.2], 26f.
126 *Ibid.* p. 26.
127 *Ibid.,* p. 27. The stiff opposition between the philosophical-cultural perspectives of 'Illuminism' (or 'existentialism') and of 'Romanticism' (or 'idealism') constitutes the fundamental historiographical criterion by which Abbagnano interprets and judges the whole development of contemporary philosophy. Cf., e.g., Abbagnano [10.1], vol. 3, parts VI and VII.
128 [10.2], 157.
129 Cf. above, note 20.
130 Errol Harris's epistemological researches appear especially interesting in this regard. For a summary exposition and interpretation of his philosophy see my books [10.80] and [10.82], part 3, ch. 3 no. 61.

CHAPTER 11
French structuralism and after

De Saussure, Lévi-Strauss, Barthes, Lacan, Foucault

Hugh J.Silverman

FERDINAND DE SAUSSURE

The history of structuralism cannot be thought without Ferdinand de Saussure (1857–1913). The Swiss linguist lecturing in Geneva in the early twentieth century set the scene for what in the two and a half decades following the Second World War came to be known as structuralism. The figures who dominated the development of the movement in the 1940s and 1950s were Claude Lévi-Strauss (b. 1908), Jacques Lacan (1901–82), and Roland Barthes (1915–80). By the 1960s Michel Foucault's (1926–84) reformulations and even rejections of structuralism indicated the new directions for what became poststructuralism.

Curiously, the parallel development of existential phenomenology in France ran a different course. With the possible exception of Maurice Merleau-Ponty's (1908–61) interests in the structuralist alternative, structuralism had little or no effect upon the development of phenomenology as a philosophical movement. With poststructuralism, however, the confluence of these two different philosophical methods marked the appearance of an entirely new mode of thinking—one which is exemplified in Foucault's archaeology of knowledge on the one hand and Jacques Derrida's (b. 1930) deconstruction on the other. For the purposes of the present chapter however, I shall take Foucault as exemplary of this new development.[1]

Structuralism—and especially French structuralism—cannot be understood apart from de Saussure's semiology. According to de Saussure—as articulated clearly in the posthumously published *Course in General Linguistics* (1916), a compilation of several years of the Swiss linguist's Geneva lectures [11.1]—semiology is 'the general science of signs'. De Saussure proposed a new understanding of the notion of 'sign'. He argued that the sign is not just a word but rather that a sign is both a word and concept. He named these two components of the sign the 'signifier' *[signifiant]* and the 'signified' *[signifié]*. The signifier is the word, that which does the signifying. The signified is the concept, that which is signified. Together these two components constitute a binary pair called the sign. The standard example which de Saussure offers for this binary relation is the word *tree* and the concept 'tree'.

A sign, however, is not yet a sign until it is distinguished from other signs in the same system, or language *[langue]*. A sign cannot be on its own—apart from all other elements of the language. Indeed, de Saussure defines a sign as determined by its difference from all other signs in the sign system. Hence the sign *tree* is the sign *tree* by its difference

from other signs such as *house, bird* and *sky*. Now the sign *tree* is also different from the sign *arbre* or the sign *Baum, arbor* or *arbol*. Each of these other signs is part of a different sign system: *arbre,* the French language, *Baum,* the German language, *arbol,* the Spanish language. Because they are not part of the same sign system, they are signs only in their respective sign systems.

De Saussure also remarks that the relation between a signifier and a signified is entirely 'arbitrary'. That the concept or signified 'tree' is designated by the word *tree* in English is simply arbitrary. It could have been called *arbre, Baum* or *arbol*—and indeed in different languages it does acquire such signifiers. Only in the limited instances of onomatopoeia in which a signifier corresponds in a motivated way to a particular signified is the arbitrary nature compromised. Hence *bow-wow* for a dog's bark, or *smooth,* for something soft and gentle, or *Being-in-the-world* for the extensiveness of our existence are connected in a more related way than most words with their corresponding concepts.

A sign—a signifier *[un signifiant]* and a signified *[un signifié]*—is one among many signs in a language *[langue]*. A *langue* can be English, French, German, Japanese, Russian, etc. In the account of a *langue* nothing need be spoken as such. Hence, de Saussure offers a correlative concept called the speaking of the language or *parole*. While *langue* is constituted by elements that make up a particular language, *parole* is the speaking of that language in a determinate context and at a determinate time. Hence when I say: 'Tall evergreen trees inspire a sense of grandeur', I am saying *[parole]* these words (with their corresponding concepts) in English. Were I to say: 'Ces grands arbres verts sont magnifiques', I am saying something else in French but I am enacting the French language in a particular context and at a specific time—the saying is *parole*.

Another binary pair (or binary opposition), as Saussure sometimes calls them, is the relation between 'syntagm' and 'system' (or 'paradigm'). The sentence 'Tall evergreen trees inspire a sense of grandeur' is a sequence of signs; one follows the other. As a sequence, the signs follow a syntagmatic line. Each sign is contiguous with the next, and there is a meaning produced by the sequence. By contrast, were one to substitute alternate signs such as 'short', 'broad', or 'imposing' for 'tall', for instance, the sentence would read: 'Short (or broad, or imposing) evergreen trees inspire a sense of grandeur.' The new sentence with the substituted term still makes sense, but the sense is of course different—and even in the first two instances a bit curious. What does not quite fit with 'tall', 'short', and 'broad' is 'imposing'. The first three are all signs of size. 'Imposing' is of another order, yet it is also substitutable for 'tall'. All of these substitutable terms are part of the same system (or paradigm) if broadly interpreted. If more narrowly interpreted, the system could be restricted to signs of size and not just signs that are substitutable. Each of the elements of the sentence could be examined in terms of substitutable signs, and each would be part of a different system.

A fourth binary opposition is that between diachrony and synchrony. A diachronic study of the Greek sign of excellence *aretē* would follow it through its Latin version in *virtus,* its Italian reformulation as *virtú,* its French usage as *vertu,* a term which is also repeated in English (virtue). To study the same work over time, chronologically, allows for the consideration of a development over time, historically, as it were. However, such a study isolates what is studied from its context and framework. It takes the element and

reviews the whole development independently of related concerns. A synchronic study, by contrast, is ultimately concerned with the set of relations among a whole complex of signs and elements that arise at the same time and in the same context. The sign *aretē* is studied in relation to other signs at the time: *paideia* (education and the ideals of the culture), *sophrosyne* (moderation or temperance), and so forth. In this respect a given notion is understood in a broad context—in this case, a cultural context. Once the synchronic study has been accomplished for a given time-slice, it will be possible to compare that time-slice with other periods of time—in order to show similarities and/or differences across a number of different time-slices.

As a linguist, de Saussure was ultimately concerned with language. Indeed, the whole project of structuralism is framed according to a linguistic model. This model presumes that what is outside language is not relevant to the linguist's task. Hence the earliest forms of structuralism were restricted to the formulations of a semiology based on language study. Roland Barthes, by contrast, in his *Elements of Semiology* (1964 [11.7]), remarks that while de Saussure believed that linguistics is a part of semiology—that there are domains of semiology that are not relevant for the linguist—in his view, semiology is a part of linguistics. Barthes's formulation presumes that all sign systems are already language systems of one sort or another—I shall return to Barthes later.

CLAUDE LÉVI-STRAUSS

What is significant here is that when Lévi-Strauss in the late 1940s began to apply structuralist principles to anthropological concerns, he was already extending the linguistic model far beyond language study. This meant that although Lévi-Strauss as an anthropologist was concerned with structures of thought, he had already made the shift that Barthes articulates: ethnology is already a language which can be studied by the structuralist.

Although de Saussure was lecturing on structural linguistics in the first decades of the century, it took until the 1930s for his work to become noticed and accessible to a broader context. This was the fate of his *Course in General Linguistics*. When Lévi-Strauss travelled to the United States during the Second World War, it was out of political and personal necessity as he narrates in considerable detail in *Tristes tropiques* [11.3]. When he arrived in New York, he began teaching at the University in Exile (which has subsequently come to be called The New School for Social Research). During that time, he met and conferred often with Roman Jakobson (1896–1982) (whose own itinerary had taken him from Russia to Prague to Paris to New York). Jacobson was a linguist whose development of Russian formalism was an important contribution to the concept of structure. Indeed both Lévi-Strauss and Jakobson worked together on a groundbreaking reading of a Baudelaire poem, 'Les Chats'. The idea was to offer a structural study of the poem. Their reading was careful and meticulous. They were interested in how the poem exhibits structural, stylistic and syntactic features in order to constitute the work as a whole. Jakobson's further interest in metaphor and metonymy was worked out in his *Fundamentals of Language* [11.50] in terms of two types of aphasia: metaphor as replacement by substitution, metonymy as replacement by

contiguity.[2]

After the war, Lévi-Strauss served as cultural adviser to the French ambassador to the United States (1946–7). Then he returned to France where he took up his position at the Ecole Pratique des Hautes Etudes en Sciences Sociales (the 'Pratique' has subsequently been dropped) and resumed his research in structural anthropology. In 1949, he produced his major contribution, *The Elementary Structures of Kinship* [11.2]. Here the concept of kinship was developed in connection with Lévi-Strauss's understanding of structuralism and his collation of many different ethnographic accounts of kinship throughout the world. His view was that despite many significant differences in kinship practice in different cultures, common structures are repeated underneath these multiple instances of kinship practices. These structures have a basic form according to a determinate set of relations. The actual character of the relation might change from one context to another, but what does not change is the relation itself. Each relation is part of a whole structure of relations, where no element is strictly independent of any of the others. Thus a one-to-one correspondence of one part of a structure with one part of another cannot be made. The whole structure must be compared with another whole structure in order to provide an appropriate analysis. For instance, Lévi-Strauss is particularly interested in the 'avunculate' or uncle-relation. He finds from his extensive research of many different cultures, societies and social groups that the role of the uncle is critical. Hence there is the mother-father relation, the mother-father and son relations, the son-maternal uncle relation, and the mother-brother relation.

Understood independently, each of these relations has a particular content: positive and socially supported in one case, negative and outcast in another. Lévi-Strauss determined that by assigning a positive or negative value to each of these relations in a particular context, he could determine the nature of the whole structure. For three hypothetical societies, it might look like Fig. 11.1.

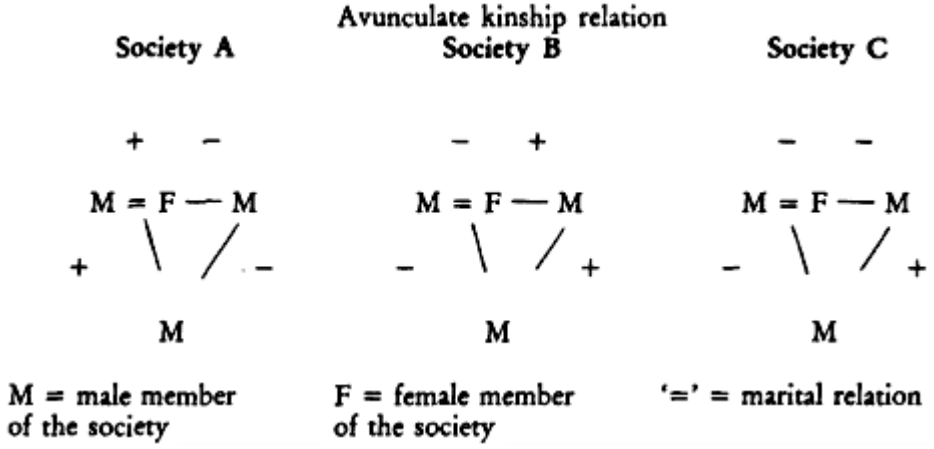

Figure 11.1

In each of these societies, the mother and father, the mother's brother and the brother's

sister's son constitute the key kinship relations. While the structure recurs, the nature of the relations change from one society to the next. The repetition of the same structure is matched with the differences in the nature of the relations among the social roles in each society.

This concept of structure indicates a latent set of relations that underlie the actual, particular and real relations of specific individuals in a determinate context. Lévi-Strauss broadens his reading of kinship relations to the account of totems and taboos in different societies as well as to the detailed study of myths. These further explorations of the application of structural method resurface in a variety of essays written between 1944 and 1957 and are collected together in the first volume of *Structural Anthropology* (1958 [11.4]). The appearance of *Structural Anthropology* marked a significant phase in the development of structuralism. *Elementary Structures* (1949, [11.2]) was highly detailed and technical. The new book solidified the role of structuralism in France. It indicated that there was now an alternative research programme that would ultimately match that of existentialism and the existential phenomenology that had reigned unopposed since the early 1940s. While it would take another decade for structuralism to establish its foothold firmly, Lévi-Strauss's new book was an important link between the growing interest in de Saussure's semiology and the full-fledged structural studies that Barthes, Lacan and Foucault would carry on into the 1960s. This is not to say that Lévi-Strauss has not been a continuing and dominant force in the development of structuralism even today. At the beginning of the 1970s, when I attended his lectures at the Collège de France where he occupies the Chair of Social Anthropology, he was still defending his position against the comments and criticisms of the British anthropologist Rodney Needham. And many books have followed the appearance of *Structural Anthropology*. His four-volume study of world mythologies, his second volume of *Structural Anthropology,* his autobiographical *Tristes tropiques,* his many essays on masks and race all add up to a major contribution to late twentieth-century French thought.

Louis Marin (1931–92) used to comment that when he was a young man in the early 1950s, he and his wife Françoise were invited to the apartment of M. and Mme Maurice Merleau-Ponty for what was then described as a 'dîner intime'. When he and his wife arrived, he discovered that it was indeed a small diner party: M. and Mme Merleau-Ponty, M. and Mme Lévi-Strauss, and M. and Mme Lacan. That these three were all friends indicates a certain collaboration and dialogue that was highly charged in the early period in which structuralism was gaining hold. Although Merleau-Ponty is known for his groundbreaking work as a phenomenologist of perception (1945), only a year later he was lecturing on de Saussure at the Ecole Normale Supérieure in Paris. Merleau-Ponty's turn to semiology as a topic of interest began to blend with his commitment to the achievements of Gestalt psychology, but even more with those of phenomenology which he saw as superior even to the Gestalt theories of Köhler and Koffka, Gelb and Goldstein. Yet with his growing interest in language, Merleau-Ponty found real value in the Saussurian theory of the sign.[3] His courses on 'Language and Communication' (1946–7) stressed his new commitment to language—a topic which he had only broached in *Phenomenology of Perception* (1945), notably in the chapter on 'The Body as Speech and Expression'. Hence concurrently with Lévi-Strauss's return to France and his intense work on kinship relations, his friend Merleau-Ponty, who was by then Professor of Child

Psychology and Pedagogy at the Institut de Psychologie in Paris, was also developing a serious interest in the implications of Saussure's structural linguistics.

When Merleau-Ponty set himself the task of writing a kind of literary theory which was to have seen the light of day in the early 1950s, he was setting the stage for an important debate that would take shape throughout the 1950s and 1960s—even long after his death in 1961. What became *The Prose of the World* (published posthumously in 1969) [11.64]) , was to have been completed in 1952. However, Merleau-Ponty was elected to the Collège de France that year and his research took him in other directions, most notably in his critique of 'dialectic' and towards his theory of visibility in *The Visible and the Invisible* (1964). There were two companion pieces that have been included in *Signs* (1960 [11.62]) which addressed the question of language: 'The Phenomenology of Language' and 'Indirect Language and the Voices of Silence'. These two essays, written in 1951–2, indicate the convergence between phenomenology and structuralism as it was under development in the French context. While Sartre continued to reject structuralism vigorously,[4] Merleau-Ponty continued to be intrigued. While Sartre published his own theory of literature in *Qu'est-ce que la littérature*? in 1947, he oriented this theory toward the act of communicating the freedom of a writer to the freedom of a reader. Writing, for Sartre, was both an act of commitment and an expression of freedom. Merleau-Ponty's response came in 1952 with *The Prose of the World:* there are many aspects of language and expression that are simply not direct, that do not give an algorithmic reading of experience—literature and painting are prime examples. Here there is language but indirectly expressed—even silence for Merleau-Ponty speaks.

ROLAND BARTHES

Like Merleau-Ponty, the second major figure of French structuralism, Roland Barthes, was also preparing in 1952 a response to Sartre's literary theory: *Writing Degree Zero* [11.5] was of mould-breaking merit. It offered an entirely different way of understanding the role and status of writing. Writing was no longer an act of communication, but rather an articulation that links up both style and language. The writer's style (whether romantic, or surrealist or existentialist) is matched with the writer's *langue* or language. This language is not simply idiosyncratic. For Barthes, language partakes of a social context and experience. Language and style at the intersection of the two marks the locus of writing *(écriture)*. Hence revolutionary writing or bourgeois writing or romantic writing occur in terms of a particular language and a determinate style. And such revolutionary writing can be found equally in the times of Thomas Jefferson, Robespierre and Brecht. Though the times are radically different, even the language and style are different, the writing can be called 'the same'. Although Barthes found that different texts could be characterized in terms of these repeatable forms of writing, he was also fascinated with the new writing of Alain Robbe-Grillet. Barthes is credited with having 'discovered' Robbe-Grillet, whose style of writing is officially a radical break with the nineteenth-century novel, but whose writing itself marks the beginning of an impassionate language where the subject is decentred and the discursive proliferations are structurally identifiable. *Le Voyeur* and *La Jalousie* are excellent examples of a language

stripped of emotion—or at least emotion as described by the typical nineteenth-century omniscient author. There is still emotion, but it is described through the surfaces and the ways in which surfaces are affected.

With the 1964 publication of *Elements of Semiology* [11.7], Barthes at last linked up his critical practice with the theoretical writings of de Saussure. In this short piece, which was originally published in *Communications,* the official journal of the Ecole Pratique des Hautes Etudes en Sciences Sociales, Barthes outlines the theory of the sign: the signifier/signified relation, the *langue/parole* link, the connection between diachrony and synchrony, and the opposition between denotation and connotation. But the critical year was 1966, which saw the publication of his own *Criticism and Truth* [11.8], Lacan's *Ecrits,* [11.15] and Foucault's *The Order of Things* [11.17]. Hence over a decade after Barthes produced *Writing Degree Zero,* structuralism finally came of age. *Elements of Semiology* set the stage for that crowning moment. In his seminar at the Ecole Pratique des Hautes Etudes which I attended for the whole year in 1971–2, Barthes focused on what he called 'The Last Decade of Semiology'. He considered 1966 as the watershed year. In the following year, Jean-Luc Godard produced his revolutionary film *La Chinoise* (which prefigured the student-worker revolts of 1968) and Derrida published *Speech and Phenomena* [11.30], *Of Grammatology* [11.29], and *Writing and Difference* [11.31]. Hence by 1967, a whole new phase had begun—for lack of a more precise term it was called poststructuralism. Of course, there were still many who were committed to structuralism for another decade and many of the so-called poststructuralist theories continued to build upon the languages and lessons of structuralism.

Once the scene was set and the terminology clarified in *The Elements of Semiology* [11.7], Barthes himself began to develop his own position further. He rejected those critical theories that gave special place to the author and authorial presence. And in his famous essay 'From Work to Text' (1971 [11.10]), he outlined very clearly the distinction between the traditional notion of the 'work' and his notion of the 'text'. The 'work' *(oeuvre, opera, Werk)* results from an act of filiation: an author produces or creates a work which is then a 'fragment of substance, occupying a part of the space of books (in a library for example)'.[5] The author requires authority over the meaning of the work. And the critic seeks to understand the author's meaning. This hermeneutic concern pervades work-centred studies. And it was also a dominant feature of the Sartrian theory as well. Barthes proposes to place the emphasis on the text, which he describes as a 'methodological field'. He elaborates: 'The Text can be approached, experienced, in reaction to the sign. The work closes on a signified' (p. 158). This means that the text can be read in terms of the sign system which participates in it, while the work focuses on what is meant by it. The plurality of the text permits a full and elaborate network of intertextuality which is closed off by the work. 'The Text', he says, 'is bound to *jouissance,* that is to a pleasure without separation' (p. 164).

Two years later, Barthes published *The Pleasure of the Text* (1973, [11.11]). For Barthes, the Text is not an object of desire or even a result of a creative act. Rather the Text is a site—a locus for a reading, a place in which *jouissance* occurs. Something happens in the critical reading of a Text. The Text's network of signifying dynamic is brought out. In the Introduction to *S/Z* (1970), Barthes had already shown how the distinction between the 'readerly' *(lisible)* and 'writerly' *(scriptible)* text marks the

difference between a text which is simply read through for the pleasure of it and the text which is read as a methodological field—one in which the codes and sign systems are elaborated in detail and available for careful decoding. The 'writerly text is not a thing,' Barthes writes, 'we would have a hard time finding it in a bookstore.'[6] The 'writerly is the novelistic without the novel, poetry without the poem, the essay without the dissertation, writing without style, pro-duction without product, structuration without structure' (p. 5). The writerly occupies only a methodological and theoretical space, it is not a product like the readerly text.

In this frame, Barthes outlined five different codes which constitute what he calls 'the plural text', and the plural text is the writerly text critically disclosed. The five codes include: the semic code (the elaboration of the signifier), the hermeneutic code (disclosure of the enigma), the symbolic code (one element stands for another), the actantial code (the action code), and the reference code (the cultural indicators marked in the text). These codes are only possible codes for the reading of a text. Although Barthes does not dwell upon the alternatives, it is only plausible that alternative sets of codes function as well as those Barthes invokes.

Barthes was at his most daring when he took up an age-old topic, namely autobiography, but in a radically new way. *Roland Barthes* (1975, [11.12]) by Roland Barthes is certainly a break with the traditional diachronic mode of writing one's own life. He organizes his life not according to the succession of years, but according to the alphabetical arrangement of topics, themes and oppositions that played an important role in his life. And as to the typical chronology, that can be found in two pages at the back of the essay. Barthes should not have died so early. He was run over by a milk truck outside the Collège de France where he had been elected to the Chair of Semiology in 1977. He was only sixty-five when he died in 1980.

JACQUES LACAN

Jacques Lacan, by contrast, born in 1901 only one year after Hans-Georg Gadamer, lived to a ripe old age of eighty-one. There is a wonderful cartoon which Barthes includes in his *Roland Barthes* of Lévi-Strauss, Lacan, Barthes, Foucault and Michel Leiris all sitting together in Tahitian skirts. Although reflecting different ages, they all came together around the structuralist enterprise. Lacan provided the basis for a structural psychoanalysis. His early 1936 study of the mirror stage was first presented in Marienbad (later made famous by Robbe-Grillet in the film *Last Year at Marienbad*). Lacan's theory is rather simple: the child at first does not detect any difference between it and its mother. The sensory world around it is all integrated. It begins to notice a difference between it and the mother. This becomes clear when it looks into the mirror and sees no longer just motion or another person, but recognizes an identity between what it sees and itself. It waves an arm and the image waves its arm, etc. It notices then that the mirror image is itself. But then the father intercedes: the *nom du père/ non du père/non-dupe erre* are all forms of interdiction. The father with his name and his prohibition—after all, he is somewhat jealous of the close relationship that his child has with his wife—attempts to break the harmony, introduces a negation, his paternal law, his 'No'. The father is no

fool. He knows what he wants and he knows what he does not want. By interceding between the child and the mother, he imposes his authority, his will, his name. Now the child cannot but recognize difference. The *Verneinung* is effective. The father imposes his will and the child learns to affirm its own identity. Thus the mirror stage is the critical moment at which the child takes on an identity of its own.

The inclusion of the revised version of the 'Mirror Stage' in *Ecrits* (1966 [11.15]) correlates with a number of other essays of major importance. In 1966 there was a conference held at Johns Hopkins University subsequently entitled *The Structuralist Controversy*. While Richard Macksey and Eugenio Donato edited the volume, the leadership of René Girard was crucial. At Stanford, for instance, in the late 1960s one heard of the Johns Hopkins experiment and those professors of literature committed to an earlier model of literary study were deeply opposed to the Johns Hopkins scene. Curiously, René Girard is now Professor of Humanities at that very same Stanford University after trying out the State University of New York at Buffalo for a brief period.

Lacan was one of the speakers at the 1966 Hopkins conference. Also presenting papers were Jean Hyppolite and Jacques Derrida. It was an important moment. And Lacan's essay was no less important. His paper was entitled 'The Insistence of the Letter in the Unconscious', an essay which also appears in *Ecrits*. The question is, how does the chain of signifiers mark off and bar the range of the signified? The signified especially in the metonymic line is barred from access by the signifier. This exclusion of the signified leads to a veering off of the signifier from one sign to the next. The signified however remains unaccessible. The line between the signifier and the signified is strong and resistant. In such cases in which the signifier has no access to the signified, it must act in terms of that repression.

In the case of metaphor, there is an overdetermination of signifieds for a particular signifier. In such a case, the bar is weak and a multiplicity of meanings intrude. Throughout Lacan's account, 'the unconscious is structured like a language'. Where there is resistance in language, there would be resistance in the unconscious. But for Lacan whatever there is of an unconscious is read in terms of the play of signifiers. Repression results when the letter is unable to insist in the signified. Meaning is kept at bay. A stream of words and utterances follows but the relation to the signified is repressed. With Lacan, as later with Derrida, the self is decentred, the subject is dispersed throughout language. The language of the self is the language of the chain of signifiers. The subject *per se* remains absent.

MICHEL FOUCAULT

The theme of the absent subject is especially notable in the philosophy of Michel Foucault, who met an untimely AIDS-related death at the early age of fifty-eight. In his *magnum opus, The Order of Things (Les Mots et les choses)* [11.17] also published in 1966—the theme of the absent subject pervades not only his reading of Velázquez but also his account of the contemporary human sciences. For contemporary (poststructuralist, or what would now be called 'postmodern') thought, there is no centred origin, no unique place of focus, no present subject as there once was for the modern age.

Foucault's reading of origins is marked off by his reading of discursive practices. As he demonstrates in *The Order of Things,* history does not begin at a certain moment and then continue—in linear fashion—from then on. Rather, moments of dominance of certain discursive practices prevail for a time and are then succeeded by a new set of discursive practices. Where a discursive practice ends, a new one is about to begin. Origin then will occur where a new discursive practice starts to take place. But where and when do such new practices begin to take place? They clearly do not occur at a determined moment in time such as a date or year. Certain discursive practices pertinent to a particular epistemological space, as Foucault calls it, continue into a new epistemological space, while others die out.

But what is a discursive practice? For Foucault, a discursive practice is a whole set of documents produced within a broadly general period of time in which common themes or ideas occur across that period in a wide variety of disciplines and areas of human knowledge production. For instance, in the nineteenth century the relations between biology, economics and philology would seem to be entirely unrelated. However Foucault has shown that they all consolidate in terms of a relatively singular conceptual unity, or what Foucault calls an *epistemé*. For the broad space of the nineteenth century, Foucault identifies the theme in question with what he calls an 'anthropology', that is, the theory of 'man' as defined by the 'empirico-transcendental doublet',[7] the particular Kantian idea that empirical (objective) considerations must always be understood in connection with a transcendental (subjective) set of conditions that permeates the discursive practices of the nineteenth century. The theme of subjectivity in relation to objectivity pervades the nineteenth-century understanding of life, labour and language. Thus the discursive practices of the nineteenth century repeat themselves in a variety of contexts—all explicitly unrelated to each other. These differences then form an *epistemé*.

The *epistemé* of the nineteenth century succeeds the *epistemé* of the 'classical age'. This prior epistemological space is marked by another set of discursive practices. These include the classification of species, the analysis of wealth and natural grammar. What one would take to be entirely unrelated concerns are here brought into relation to one another in that they each exhibit features of the 'classical age' *epistemé,* namely 'representation'. As Foucault reads the general period of the seventeenth century and first half of the eighteenth century, the idea of 'representation'—the projection or postulate of ideas before the mind—formed the frame for a distinctly 'classical' way of thinking. The relation between this classical *epistemé* and the nineteenth-century *epistemé* is much less significant than the relation between the various practices at each of these respective time-slices.

The origin of the *epistemé* is not the beginning of the *epistemé*. A particular *epistemé* is marked by a certain dominance. The place where the *epistemé* dominates is the place of its origin. The place of dominance for the empirico-transcendental doublet is the place of origin within that epistemological framework. Similarly the place of dominance of *representation* in the classical age is the place of origin within that epistemological framework. However, where is this place of origin in each case? Dispersed throughout the epistemological space, the place of origin occurs wherever there is a discursive practice that exhibits it. Hence the origin is in many places: reappearing in many locations throughout the epistemological space itself. In the nineteenth century, one can

find the empirico-transcendental doublet not only in Hegel and Hölderlin but also in biologists such as Cuvier (whose 'fixism' is set off against the backdrop of human historicity), economists such as Ricardo (for whom history is a vast compensating mechanism) and philologists such as Schlegel (with his 1808 essay on the language and philosophy of the Indians), and philologists such as Grimm (most notably in the 1818 *Deutsche Grammatik*) and Bopp (whose 1816 study of the Sanskrit conjugation system became an object of study).

Each of these places constitutes itself as an origin, as a locus in which the concept of 'man' as a subject-object is brought into discourse production itself. No longer does language, for instance, operate between words and things resulting in an operation of representation. And in the nineteenth century, words are objects themselves, objects for scrutiny and study by a scientific practice that hopes to judge them and their interrelationships. Origin, then, for Foucault is not a source from which all historical events follow. Origin is not the beginning from which history begins to unfold. Origin is not the inception from which development ensues. Origin does not establish the moment before which nothing else will have occurred. Rather origin springs up in many places within a broad, general, historical time-frame. Origins occur in various discourses, scarring them with marks of a common practice that is unaware of its own commonality.

Foucault's enterprise disperses origin throughout a kind of methodological field (as Barthes would have called it). And his appeal to the English reader to ignore those 'tiny little minds that persist in calling him a structuralist', indicates that he is already beyond the mere repetition of structuralist methods. Although his own archaeology of knowledge could be characterized as largely synchronic, it also relies upon the assessment of periods or time-slices in order to compare one time-slice with another. What Foucault rejects is the necessity of a concept of continuity in favour of discontinuity. Structuralists were already concerned with a discourse of the past. Nietzsche and Mallarmé are invoked as threshold figures marking the break with the older empirico-transcendental doublet of the modern age. They mark the beginning of a new mode of thought in which dissemination, dispersal, metonymy and decentring of the subject are the dominant frames of knowledge production.

Where Sartre had announced in his 1936 *Transcendence of the Ego* that the self or ego could not be located in consciousness but is at best an object of consciousness, Foucault in 1966 places that claim in a historical context. He situates the end of the age of modernism with the end of the centred subject, the dominant self, the focal 'I'. Like Nietzsche's madman who ran through the streets proclaiming the 'death of god', Sartre had already proclaimed 'the end of man', but in a sense that would not be fully understood for another thirty years. The linguistic turn in continental philosophy took on a different shape from that in the analytic tradition. It did not fully take place until the Saussurian epistemology became the principle according to which language, culture and knowledge production would be understood. The structural analysis of kinship, totems and myths in Lévi-Strauss, the speaking subject's chain of signifiers in Lacan, the semiological analysis of text and culture in Barthes were themselves placed in context by Foucault. In this respect, Foucault is indeed already after structuralism, for he is able to situate it as a movement in a period of time. The subsequent development of Foucault's own genealogy, Derrida's deconstruction, Deleuze's nomadologies, Kristeva's

semanalysis and Lyotard's postmodernist sublimities are all themes for another story in the history of continental thought. Suffice it to say that structuralism played a critical role in offering an alternative to existential phenomenology and at the same time a complement to it. What comes after structuralism (and after the age of the modern subject) is identified by those such as Foucault who were themselves marked by both phenomenology and structuralism and who were in a position to succeed them as well.

NOTES

1 Derrida's deconstruction is left aside here for the simple reason that it is taken up in another contribution to this same volume. A portion of the discussion of Foucault is taken from H.J.Silverman, *Textualities: Between Hermeneutics and Deconstruction* (New York and London: Routledge, 1993).

2 The role of metaphor and metonymy have been subsequently linked with what Freud calls 'condensation' and 'displacement' in dream interpretation. Hence metaphor as substitution and condensation implies the replacement of a father by a big bear (for instance) in a young boy's dream, while metonymy as contiguity and displacement results in a dream about a neighbour's garden hose (for instance) instead of her passion for him. In structural political theory, developed most notably by Louis Althusser—in an essay called 'Freud and Lacan' from *Lenin and Philosophy* [11.23] metaphor is associated with overdetermination in a reading of a political text or context, while metonymy is represented as underdetermination. In making this point, Althusser is building on the account of metaphor and metonymy offered by Lacan in his famous essay 'The Insistence of the Letter in the Unconscious' (included in *Ecrits* [11.15]) and H.J.Silverman [11.72], especially the chapter on 'Merleau-Ponty on Language and Communication (1946–47)'.

CHAPTER 12
French feminist philosophy

De Beauvoir, Kristeva, Irigaray, Le Doeuff, Cixous

Alison Ainley

INTRODUCTION

Although women have been active philosophers for many centuries,[1] the development of a specifically feminist viewpoint in the context of philosophy has gained credence only comparatively recently; partly as a result of more widespread debates about sexual politics in recent years, and partly as a result of social changes in the status of women. While recognizing that feminism did not spring fully formed and fully armed from the last twenty years like Athena from the brow of Zeus,[2] for reasons of brevity I will discuss in this chapter only a few of the better-known contemporary contributors to feminist philosophy, and focus particularly on those feminists whose work overlaps with or draws upon continental philosophy.

At the outset, it should be stressed that the strands of feminist thinking in relation to philosophy have been and continue to be diverse and do not necessarily present a unified point of view. Feminist thinking in relation to philosophy can take place at a number of levels and from different perspectives, and indeed this has been one of the strengths of its position(s). In general terms, it can take the form of a critique of philosophers' images of women (for example, criticisms of Schopenhauer's description of women as 'defective, trivial, silly and shortsighted',[3] or Kant's account of women as more sentimental and more 'delicate in judgment' than men).[4] It can be historical research into past women philosophers whose work may have been unjustly disregarded.[5] It can be a political critique of the organization of the discipline of philosophy, or a critique of the whole of philosophy as 'male' or 'masculine'.[6] Or it can be positive contributions to philosophy from a feminist perspective.[7] Feminist philosophy may take all or some of these approaches to be important. However, as a general guide, feminist philosophy will assume the question of sexual difference to be a philosophical issue at some level and, depending on the point of departure, produce very different ways of theorizing this question. Having said this, not all women philosophers are necessarily feminist philosophers (although there may be feminist implications in their work); for example Hannah Arendt and Simone Weil are twentieth-century thinkers whose work I will not discuss here;[8] and not all feminists accept the relevance of philosophy to their work.

Despite these qualifications, a notable amount of feminist thinking has been greatly influenced and aided by developments in recent continental philosophy, borrowing from thinkers such as Jacques Derrida, Michel Foucault, Jean-Paul Sartre and Jacques Lacan, and earlier figures such as Hegel, Freud and Heidegger.[9] Such borrowings have furnished

many different aspects of feminist approaches to questions of sexual difference, subjectivity and selfhood, ethics and epistemology. Because the above thinkers have been concerned to raise questions about the discipline of philosophy itself—for example, what they see as philosophy's tendency to organize its enquiries in particular ways around notions of truth or knowledge, the use of binary oppositions or dualisms of mind/body, spirit/matter, order/chaos and hierarchical structures, and the issues of power and politics—they have been helpful in the search for ways of theorizing sexual difference for feminists.

However, feminist theorists have also been highly critical of the above thinkers, sometimes finding their work reduplicating some of the problems they had already identified with the discipline of philosophy in general, i.e. the exclusion of women as philosophers, the use of such symbolic values as 'the feminine' to indicate chaos and plurality without considering how such values relate to women, or the tendency to speak 'on behalf of' women.[10] In other words, feminists have been concerned about the apparent loss or lack of political agency which seems to accompany critiques of identity in recent postmodernist theory. Postmodernists such as Jean Baudrillard respond that 'there is a strange, fierce complicity between the feminist movement and the order of truth'[11] and women would do better to recognize that 'woman is but appearance. And it is the feminine as appearance that thwarts masculine depth. Instead of rising up against such insulting counsel, women would do well to let themselves be seduced by its truth, for here lies the secret of their strength.'[12]

The critiques of identity which thinkers such as Derrida, Baudrillard and Gilles Deleuze advance mean that women, characteristically stereotyped as lacking agency in the past, are ironically now 'already' in an enviable position.[13] But feminists have been alarmed or suspicious of the passivity implied in such characterizations of the feminine.

Such disagreements have often been placed in the context of the modernism/postmodernism debate, where feminist theorists are seen to be holding on to notions of emancipatory Enlightenment projects and 'essentialist' notions of identity in the face of, and in opposition to, unassimilatable heterogeneity and the feminine as 'mere' surface. However, the feminist thinkers I discuss below have, I believe, a subtle and complex approach to political questions and are not easily placed into this either/or debate. In addition to raising questions of sexual difference in the context of philosophy, they also raise questions about the connection (or lack of it) between theory and practice/lived experience—women *are* the ones (amongst others) over whose heads this discussion often seems to take place, and deserve to be able to make their own contribution.

SIMONE DE BEAUVOIR

Simone de Beauvoir is perhaps the best-known feminist philosopher of the twentieth century. Her lifelong association with Jean-Paul Sartre seems to have been on the whole one of mutual intellectual inspiration and companionship.[14] De Beauvoir's work on the moral implications and the social context of existentialism, for example in her 1947 work *Pour une morale de l'ambiguité* (translated as *The Ethics of Ambiguity*)[15] was influential

upon Sartre, an influence discernible in his shift of focus from the individual consciousness in *Being and Nothingness*[16] to the more collective or situated concerns of his later work. The publication in 1949 of de Beauvoir's best-known work, *The Second Sex,*[17] continued her interest in these themes, a work which provoked reviewers to express outrage at a book which was seen to herald the breakdown of social relations. However, given that de Gaulle had granted French women the vote only five years earlier, the radical impact of this book should not be underestimated.

T*he Second Sex* is a rich and complex work which draws upon literature, myth and religion, theories of biology, accounts of social and economic development (Marxism and psychoanalysis), but also existentialist philosophy. De Beauvoir's aim is to address the question 'What is a woman?'[18] It is because her painstaking analysis uncovers and addresses the nature of the oppression and exclusion of women that it has been significant in the history of feminist thought. But de Beauvoir is also responsible for the promotion of questions of sexual difference on to the philosophical agenda, and for probing questions about the social context of the existentially free individual. Sartre, Merleau-Ponty and other existentialist thinkers agreed that sexuality was an issue that had been largely disregarded in philosophy, but de Beauvoir's work most insistently asks questions of the relevance of sexual difference to philosophical notions of identity, an insistence Michèle Le Doeuff has called 'a characteristic genius for the inappropriate'.[19] De Beauvoir points out that sexuality is not just 'added on' to human beings but plays a fundamental role in the meaning of an individual's existence: that we are 'embodied'.

However, she rejects the accounts of sexual difference which subscribe to an 'essential' notion of identity, whether this is found in the biological differentiation of the sexes (male/female) or in the 'eternal feminine', an ideal 'essence' of feminine qualities.[20] She rejects these accounts first because she sees individuals as dynamic, engaged in struggles towards freedom, and second because she fears that to suggest an 'essential' nature of woman will allow women to be imprisoned back in the problematic identity of the oppressed. This identity is unacceptable for ideals of existential freedom, and for feminist claims that women should have equal opportunities to engage freely in projects in the world. Her overwhelming historical evidence points to the fact that, in general, men possess such freedom and women do not.

De Beauvoir takes up the concerns of existentialist thinking with the freedom of the individual, the capacity of the individual to make choices and the conflicts which arise between individuals in the context of social relations. She claims that *The Second Sex* is 'an existentialist ethics',[21] and hence agrees with Sartre about the need for individuals 'to engage in freely chosen projects'.[22] The Sartrean individual, striving to maximize freedom, becomes aware that he or she exists as an object in the consciousness of others, a compromising objectification for an individual striving towards freedom. Individuals may become locked into opposing the determinations that others, with their own projects and their capacity to objectify an individual, present. This means that social relations are inherently conflictual, basically relations of dominance and submission. For de Beauvoir, it is important that freedom be maintained as an open horizon, since this is what gives meaning to an individual's existence. However, she immediately questions the apparent neutrality of the individual and the equal starting point of human freedom and autonomy that existentialist individuals are supposed to possess. She points out that, rather than

beginning from a neutral and autonomous point, women are already in the position of the determined and objectified, as the Other. 'She is defined and differentiated with reference to man and he not with reference to her; she is the incidental, the inessential as opposed to the essential. He is the Subject, he is the Absolute—she is the Other.'[23]

The freedom of the existential individual is immediately compro-mised by the socially constructed roles for men and women; rather than various neutral possibilities presented to equal individuals, women are unable to exercise their freedom, because they inherit a pre-given set of assumptions shaping the range of possibilities available to them.

This seems to suggest that women are doomed to be inauthentic because of their sex, if inauthenticity is the failure to maximize one's freedom. Women are in the position of being the second sex. Their existence is constantly conflated with their gender in a way that men's is not, and they seem to be more confined to being bodies or objects.
